Title = Header 2

Chapters = header 3

Astounding Stories Of Super- Science

Contributing Authors, in order of appearance:

Victor Rousseau Emanuel

Sterner St. Paul Meek

Ray Cummings

M. L. Staley

Charles Victor Tench

Murray Leinster

Anthony Pelcher

Harold Vincent Schoepflin

Charles Willard Diffin

Hugh Barnett Cave

Sophie Wenzel Ellis

Will Smith

R. J. Robbins

Sewell Peaslee Wright

A. T. Locke

Thomas Holt Knight

Arthur Josephus Burks

Tom Curry

Lilith Lorraine

James P. Olsen

Roman Frederick Starzl

Edmond Hamilton

Harold Thompson Rich

Miles John Breuer, M.D.

Paul Ernst

Robert Henry Leifred

Jackson Gee

William Merriam Rouse

Lloyd Arthur Eshbach

David R. Sparks

Hal K. Wells

Note from the editor of this master file:

This compilation was started on July 2nd, 2023, by Tinyel. Which is pronounced exactly the way it looks: tin-yell. Two syllables. I am nonbinary, and my pronouns are it/its/itself.

This means that rather than saying “He combined Astounding Stories of Super-Science into one master book”, or “She edited the formatting from the original magazine's set up”, or “They removed all the randomly inserted advertisements and put them in the back of the book”, you say: “It wanted to make life easier for future readers of Astounding Stories of Super-Science, so it created this compilation so you don't have to. That was very nice of it.”

Originally published from January 1930 to January 1931, the following short stories were spaced out across thirteen issues of Astounding Stories of Super-Science.

They are now (and have been for a while) public domain, meaning they belong to everyone and no one, and are available to download from Gutenberg.org, archive.org, and many other places, for free, endlessly.

To make things more convenient for future readers, I have compiled all the short stories into a single file, with the formatting fixed from the original magazine layout, the illustrations put in the proper places, trigger warnings added before each story, and the stories that had been originally broken up into multiple parts now combined into a whole. Stories that had sequels will now have the sequel immediately following the first story.

This version of the master file will include all stories as they were originally published. A second version will be hand-picked of my favorite of these stories, with are also the ones with the least amount of bigotry.

Each story will have specific warnings and ratings in front for your convenience, but as a general warning,

many of the authors showcased here were cis straight white privileged men, and they hated women, they hated Black and brown people, they hated fat people, they hated disabled people, they hated foreigners...the list goes on.

Some of these stories are more bigoted than others, and some are so bigoted I had to stop and resist the urge to throw my phone across the room. Some of them are also just not very well written.

I hope you enjoy reading at least some of these stories.

Astounding Stories of Super-Science

January 1930

#01 The Beetle Horde, By Victor Rousseau

Emanuel:

Only two young explorers stand in the way of the mad Bram's horrible revenge—the releasing of his trillions of man-sized beetles upon an utterly defenseless world.

Aproximate word count: 24,000

Bigotry: Racism, ableism,

Warnings:

Chapter 1: Dodd's Discovery

Out of the south the biplane came winging back toward the camp, a black speck against the dazzling white of the vast ice-fields that extended unbroken to the horizon on every side.

It came out of the south, and yet, a hundred miles further back along the course on which it flew, it could not have proceeded in any direction except northward. For a hundred miles south lay the south

pole, the goal toward which the Travers Expeditions had been pressing for the better part of that year.

Not that they could not have reached it sooner. As a matter of fact, the pole had been crossed and re-crossed, according to the estimate of Tommy Travers, aviator, and nephew of the old millionaire who stood fairy uncle to the expedition. But one of the things that was being sought was the exact site of the pole. Not within a couple of miles or so, but within the fraction of an inch.

It had something to do with Einstein, and something to do with terrestrial magnetism, and the variations of the south magnetic pole, and the reason therefore, and something to do with parallaxes and the precession of the equinoxes and other things, this search for the pole's exact location. But all that was principally the affair of the astronomer of the party. Tommy Travers, who was now evidently on his way back, didn't give a whoop for Einstein, or any of the rest of the stuff. He had been enjoying himself after his fashion during a year of frostbites and hard rations, and he was beginning to anticipate the

delights of the return to Broadway.

Captain Storm, in charge of the expedition, together with the five others of the advance camp, watched the plane maneuver up to the tents. She came down neatly on the smooth snow, skidded on her runners like an expert skater, and came to a stop almost immediately in front of the marquee.

Tommy Travers leaped out of the enclosed cockpit, which, shut off by glass from the cabin, was something like the front seat of a limousine.

"Well, Captain, we followed that break for a hundred miles, and there's no ground cleft, as you expected," he said. "But Jim Dodd and I picked up something, and Jim seems to have gone crazy."

Through the windows of the cabin, Jim Dodd, the young archaeologist of the party, could be seen apparently wrestling with something that looked like a suit of armor. By the time Captain Storm, Jimmy, and the other members of the party had reached the cabin door, Dodd had got it open and flung himself out backward, still hugging what he had found, and maneuvering so that he managed to fall on his back and sustain its weight.

"Say, what the—what—what's that?" gasped Storm.

Even the least scientific minded of the party gasped in amazement at what Dodd had. It resembled nothing so much as an enormous beetle. As a matter of fact, it was an insect, for it had the three sections that characterize this class, but it was merely the shell of one. Between four and five feet in height, when Dodd stood it on end, it could now be seen to consist of the hard exterior substance of some huge, unknown coleopter.

This substance, which was fully three inches thick

over the thorax, looked as hard as plate armor.

"What is it?" gasped Storm again.

Tommy Travers made answer, for James Dodd was evidently incapable of speech, more from emotion than from the force with which he had landed backward in the snow.

"We found it at the pole, Captain," he said. "At least, pretty near where the pole ought to be. We ran into a current of warm air or something. The snow had melted in places, and there were patches of bare rock. This thing was lying in a hollow among them."

"If I didn't see it before my eyes, I'd think you crazy, Tommy," said Storm with some asperity. "What is it, a crab?"

"Crab be damned!" shouted Jim Dodd, suddenly recovering his faculties. "My God, Captain Storm, don't you know the difference between an insect and a crustacean? This is a fossil beetle. Don't you see the distinguishing mark of the coleoptera, those two

elytra, or wing-covers, which meet in the median dorsal line? A beetle, but with the shell of a crustacean instead of mere chitin. That's what led you astray, I expect. God, what a tale we'll have to tell when we get back to New York! We'll drop everything else, and spend years, if need be, looking for other specimens."

"Like fun you will!" shouted Higby, the astronomer of the party. "Lemme tell you right here, Dodd, nobody outside the Museum of Natural History is going to care a damn about your old fossils. What we're going to do is to march straight to the true pole, and spend a year taking observations and parallaxes. If Einstein's brochure, in which he links up gravitation with magnetism, is correct—"

"Fossil beetles!" Jim Dodd burst out, ignoring the astronomer. "That means that in the Tertiary Era, probably, there existed forms of life in the antarctic continent that have never been found elsewhere. Imagine a world in which the insect reached a size proportionate to the great saurians, Captain Storm! I'll wager poor Bram discovered this. That's why he

stayed behind when the Greystoke Expedition came within a hundred miles of the pole. I'll wager he's left a cairn somewhere with full details inside it. We've got to find it. We—"

But Jim Dodd, suddenly realizing that the rest of the party could hardly be said to share his enthusiasm in any marked degree, broke off and looked sulky.

"You say you found this thing pretty nearly upon the site of the true pole?" Captain Storm asked Tommy.

"Within five miles, I'd say, Captain. The fog was so bad that we couldn't get our directions very well."

"Well, then, there's going to be no difficulty," answered Storm. "If this fair weather lasts, we'll be at the pole in another week, and we'll start making our permanent camp. Plenty of opportunity for all you gentlemen. As for me, I'm merely a sailor, and I'm trying to be impartial."

"And please remember, gentlemen, that we're well into March now, and likely to have the first storms of

autumn on us any day. So let's drop the argument and remember that we've got to pull together!"

Tommy Travers was the only skilled aviator of the expedition, which had brought two planes with it. It was a queer friendship that had sprung up between him and Jim Dodd. Tommy, the blasé ex-Harvard man, who was known along Broadway, and had never been able to settle down, seemed as different as possible from the spectacled, scholarly Dodd, ten years his senior, red-haired, irascible, and living, as Tommy put it, in the Age of Old Red Sandstone, instead of in the year 1930 A. D.

It was generally known—though the story had been officially denied—that there had been trouble in the Greystoke Expedition of three years before. Captain Greystoke had taken the brilliant, erratic Bram, of the Carnegie Archaeological Institute, with him, and Bram's history was a long record of trouble.

It was Bram who had exploded the faked neolithic finds at Mannheim, thereby earning the undying enmity of certain European savants, but brilliantly demolishing them when he smashed the so-called Mannheim stone pitcher (valued at a hundred

thousand dollars) with a pocket-axe, and caustically inquired whether neolithic man used babbit metal rivets to fasten on his jug handles.

Bram's brilliant work in the investigation of the origin of the negrito Asiatic races had been awarded one of the Nobel prizes, and Bram had declined it in an insulting letter because he disapproved of the year's prize award for literature.

He had been a storm center for years, embittered by long opposition, when he joined the Greystoke Expedition for the purpose of investigating the marine fauna of the antarctic continent.

And it was known that his presence had nearly brought the Greystoke Expedition to the point of civil war. Rumor said he had been deliberately abandoned. His enemies hoped he had. The facts seemed to be, however, that in an outburst of temper he had walked out of camp in a furious snowstorm and perished. For days his body had been sought in vain.

Jimmy Dodd had run foul of Bram some years before,

when Bram had published a criticism of one of Dodd's addresses dealing with fossil monotremes, or egg-laying mammals. In his inimitable way, Bram had suggested that the problem which came first, the egg or the chicken, was now seen to be linked up with the Darwinian theory, and solved in the person of Dodd.

Nevertheless, Jimmy Dodd entertained a devoted admiration for the memory of the dead scientist. He believed that Bram must have left records of inestimable importance in a cairn before he died. He wanted to find that cairn.

And he knew, what a number of Bram's enemies knew, that the dead scientist had been a morphine addict. He believed that he had wandered out into the snow under the influence of the drug.

Dodd, who shared a tent with Tommy, had raved the greater part of the night about the find.

"Well, but see here, Jimmy, suppose these beetles did inhabit the antarctic continent a few million years ago, why get excited?" Tommy had asked.

"Excited?" bellowed Dodd. "It opens one of the biggest problems that science has to face. Why haven't they survived into historic times? Why didn't they cross into Australia, like the opossum, by the land bridge then existent between that continent and South America? Beetles five feet in length, and practically invulnerable! What killed them off? Why didn't they win the supremacy over man?"

Jimmy Dodd had muttered till he went to sleep, and he had muttered worse in his dreams. Tommy was glad that Captain Storm had given them permission to return to the same spot next morning and look for further fossils, though his own interest in them was of the slightest.

The dogs were being harnessed next morning when the two men hopped into the plane. The thermometer was unusually high for the season, for in the south polar regions the short summer is usually at an end by March. Tommy was sweating in his furs in a temperature well above the freezing point. The snow was crusted hard, the sky overcast with clouds, and a wind was blowing hard out of the south, and

increasing in velocity hourly.

"A bad day for starting," said Captain Storm. "Looks like one of the autumn storms was blowing up. If I were you, I'd watch the weather, Tommy."

Tommy glanced at Dodd, who was huddled in the rear cockpit, fuming at the delay, and grinned whimsically. "I guess I can handle her, Captain," he answered. "It's only an hour's flight to where he found that fossil."

"Just as you please," said Storm curtly. He knew that Tommy's judgment as a pilot could always be relied upon. "You'll find us here when you return," he added. "I've counter-manded the order to march. I don't like the look of the weather at all."

Tommy grinned again and pressed the starter. The engine caught and warmed up. One of the men kicked away the blocks of ice that had been placed under the skids to serve as chocks. The plane taxied over the crusted snow, and took off into the south.

The camp was situated in a hollow among the ice-mountains that rose to a height of two or three thousand feet all around. Tommy had not dreamed how strongly the gale was blowing until he was over the top of them. Then he realized that he was facing a tougher proposition than he had calculated on. The storm struck the biplane with full force.

A snowstorm was driving up rapidly, blackening the sky. The sun, which only appeared for a brief interval every day, was practically touching the horizon as it rose to make its minute arc in the sky. A star was visible through a rift in the clouds overhead, and the pale daylight in which they had started had already become twilight.

Tommy was tempted to turn back, but it was only a hundred miles, and Jimmy Dodd would give him no peace if he did so. So he put the plane's nose resolutely into the wind, watching his speed indicator drop from a hundred miles per hour to eighty, sixty, forty—less.

The storm was beating up furiously. Of a sudden the clouds broke into a deluge of whirling snow.

In a moment the windshield was a frozen, opaque mass. Tommy opened it, and peered out into the biting air. He could see nothing.... The plane, caught in the fearful cross-currents that swirl about the southern roof of the world, was fluttering like a leaf in the wind. The altimeter was dropping dangerously.

Tommy opened the throttle to the limit, zooming, and, like a spurred horse, the biplane shot forward and upward. She touched five thousand, six, seven—and that, for her, was ceiling under those conditions, for a sudden tremendous shock of wind, coming in a fierce cross-current, swung her round, tossed her to and fro in the enveloping white cloud. And Tommy knew that he had the fight of his life upon his hands.

The compasses, which required considerable daily adjusting to be of use so near to the pole, had now gone out of use altogether. The air speed indicator had apparently gone west, for it was oscillating between zero and twenty. The turn and bank indicator

was performing a kind of tango round the dial. Even the eight-day clock had ceased to function, but that might have been due to the fact that Tommy had neglected to wind it. And the oil pressure gauge presented a still more startling sight, for a glance showed that either there was a leak or else the oil had frozen.

Tommy looked around at Dodd and pointed downward. Dodd responded with a vicious forward wave of his hand.

Tommy shook his head, and Dodd started forward along the cabin, apparently with the intention of committing assault and battery upon him. Instead, the archaeologist collapsed upon the floor as the plane spun completely around under the impact of a blast that was like a giant's slap.

The plane was no longer controllable. True, she responded in some sort to the controls, but all Tommy was able to do was to keep her from going into a crazy sideslip or nose dive as he fought with the elements. And those elements were like a devil

unchained. One moment he was dropping like a plummet, the next he was shooting up like a rocket as a vertical blast of air caught the plane and tossed her like a cork into the invisible heavens. Then she was revolving, as if in a maelstrom, and by degrees this rotary movement began to predominate.

Round and round went the plane, in circles that gradually narrowed, and it was all Tommy could do to swing the stick so as to keep her from skidding or sideslipping. And as he worked desperately at his task Tommy began to realize something that made him wonder if he was not dreaming.

The snow was no longer snow, but rain—mist, rather, warm mist that had already cleared the windshield and covered it with tiny drops.

And that white, opaque world into which he was looking was no longer snow but fog—the densest fog that Tommy had ever encountered.

Fog like white wool, drifting past him in fleecy flakes that looked as if they had solid substance. Warm fog

that was like balm upon his frozen skin, but of a warmth that was impossible within a few miles of the frozen pole.

Then there came a momentary break in it, and Tommy looked down and uttered a cry of fear. Fear, because he knew that he must be dreaming.

Not more than a thousand feet beneath him he saw patches of snow, and patches of—green grass, the brightest and most verdant green that he had ever seen in his life.

He turned round at a touch on his shoulder. Dodd was leaning over him, one hand pointing menacingly upward and onward.

"You fool," Tommy bellowed in his ear, "d'you think the south pole lies over there? It's here! Yeah, don't you get it, Jimmy? Look down! This valley—God, Jimmy, the south pole's a hole in the ground!"

And as he spoke he remembered vaguely some crank who had once insisted that the two poles were hollow

because—what was the fellow's reasoning? Tommy could not remember it.

But there was no longer any doubt but that they were dropping into a hole. Not more than a mile around, which explained why neither Scott nor Amundsen had found it when they approximated to the site of the pole. A hole—a warm hole, up which a current of warm air was rushing, forming the white mist that now gradually thinned as the plane descended. The plateau with its covering of eternal snows loomed in a white circle high overhead. Underneath was green grass now—grass and trees!

The fog was nearly gone. The plane responded to the controls again. Tommy pushed the stick forward and came round in a tighter circle.

And then something happened that he had not in the least expected. One moment he seemed to be traveling in a complete calm, a sort of clear funnel with a ring of swirling fog outside it—the next he was dropping into a void!

There was no air resistance—there seemed hardly any air, for he felt a choking in his throat, and a tearing at his lungs as he strove to breathe. He heard a strangled cry from Dodd, and saw that he was clutching with both hands at his throat, and his face was turning purple.

The controls went limp in Tommy's hands. The plane, gyrating more slowly, suddenly nosed down, hung for a moment in that void, and then plunged toward the green earth, two hundred feet below, with appalling swiftness.

Tommy realized that a crash was inevitable. He threw his goggles up over his forehead, turned and waved to Dodd in ironic farewell. He saw the earth rush up at him—then came the shattering crash, and then oblivion!

Chapter 2: Beetles and Humans

How long he had remained unconscious, Tommy had no means of determining. Of a sudden he found himself lying on the ground beside the shattered

plane, with his eyes wide open.

He stared at it, and stared about him, without understanding where he was, or what had happened to him. His first idea was that he had crashed on the golf links near Mitchell Field, Long Island, for all about him were stretches of verdant grass and small shrubby plants. Then, when he remembered the expedition, he was convinced that he had been dreaming.

What brought him to a saner view was the discovery that he was enveloped in furs which were insufferably hot. He half raised himself and succeeded in unfastening his fur coat, and thus discovered that apparently none of his bones was broken.

But the plane must have fallen from a considerable height to have been smashed so badly. Then Tommy discovered that he was lying upon an extensive mound of sand, thrown up as by some gigantic mole, for burrow tracks ran through it in every direction. It was this that had saved his life.

Something was moving at his side. It was half-submerged in the sand-pile, and it was moving parallel to him with great rapidity.

A grayish body, half-covered with grains of sand emerged, waving two enormously long tentacles. It was a shrimp, but fully three feet in length, and Tommy had never before had any idea what an unpleasant object a shrimp is.

Tommy staggered to his feet and dropped nearer the plane, eyeing the shrimp with horror. But he was soon relieved as he discovered that it was apparently harmless. It slithered away and once more buried itself in the pile of sand.

Now Tommy was beginning to remember. He looked into the wreckage of the plane. Jim Dodd was not there. He called his name repeatedly, and there was no response, except a dull echo from the ice-mountains behind the veil of fog.

He went to the other side of the plane, he scanned the ground all about him. Jimmy had disappeared. It was

evident that he was nowhere near, for Tommy could see the whole of the lower scope of the bowl on every side of him. He had walked away—or he had been carried away! Tommy thought of the shrimp, and shuddered. What other fearsome monsters might inhabit that extraordinary valley?

He sat down, leaning against the wreck of the fuselage, and tried to adjust his mind, tried to keep himself from going mad. He knew now that the flight had been no dream, that he was a member of his uncle's expedition, that he had flown with Jim toward the pole, had crashed in a vacuum. But where was Jim? And how were they going to get out of the damn place?

Something like a heap of stones not far away attracted Tommy's attention. Perhaps Jim Dodd was lying behind that. Once more Tommy got upon his feet and began walking toward it. On the way, he stumbled against the sharp edge of something that protruded from the ground.

It cut his leg sharply, and, with a curse, he began

rubbing his shin and looking at the thing. Then he saw that it was another of the fossil shells, half-buried in the marshy ooze on which he was treading. The ground in this lower part of the valley was a swamp, on account of the very fine mist falling from the fog clouds that surrounded it impenetrably on every side.

Then Tommy came upon another shell, and then another. And now he saw that there were piles of what he had taken to be rock everywhere, and that this was not rock but great heaps of the shells, all equally intact.

Hundreds of thousands of the prehistoric beetles must have died in that valley, perhaps overcome by some cataclysm.

Tommy examined the heap near which he stood; he yelled Dodd's name, but again no answer came.

Instead, something began to stir among the heaps of shells. For a moment Tommy hoped against hope that it was Dodd, but it wasn't Dodd.

It was a living beetle!

A beetle fully five feet high as it stood erect, a pair of enormous wings outspread. And the head, which was larger than a man's, was the most frightful object Tommy had ever seen.

Jim Dodd would have said at once that this was one of the Curculionidae, or snout beetles, for a prolongation of the head between the eyes formed a sort of beak a foot in length. The mouth, which opened downward, was armed with terrific mandibles, while the huge, compound eyes looked like enormous crystals of cut glass. Immediately in front of the eyes were two mandibles as long as a man's arms, with feathery processes at the ends. In addition to these there were three pairs of legs, the front pair as long as a man's, the hind pair almost as long as a horse's.

Paralyzed with horror, Tommy watched the monster, which had apparently been disturbed by the vibrations of his voice, extract itself from among the shells. Then, with a bound that covered fifteen feet, it had lessened the distance between them by half.

And then a still more amazing thing happened. For of a sudden the hard shell slipped from the thorax, the wing-cases dropped off, the whole of the bony parts slipped to the ground with a clang, and a soft, defenseless thing went slithering away among the rocks.

The beetle had moulted!

Tommy dropped to the ground in the throes of violent nausea.

Then, looking up again, he saw the girl!

She was about a hundred yards away from him, very close to the fallen plane, and she must have emerged from a large hole in the ground which Tommy could now see under a ledge of overhanging rock.

She seemed to be dressed in a single garment which fell to her knees, and appeared to fit tightly about her body, but as she came nearer, Tommy, watching her, petrified by this latest apparition, discovered that it was woven of her own hair, which must have been of

immense length, for it fell naturally to her shoulders, and thence was woven into this close-fitting material, a fringe an inch or two in length extending beneath the selvage.

She was about six feet tall, and apparently made after the normal human pattern. She moved with a slow, majestic swing, and if ever any female had seemed to Tommy to have the appearance of an angel, this unknown woman did.

She was so fair, in that flossy, flaxen covering, she moved with such easy grace, that Tommy, gaping, gradually crept nearer to her. She did not seem to see him. She was stooping over the very sand heap into which he had fallen. Suddenly, with lightning-like rapidity, her arms shot out, her hands began tunneling in the sand. With a cry of triumph she pulled out the shrimp Tommy had seen, or another like it, and, stripping it off the shell, began devouring it with evident relish.

In the midst of her meal the girl raised her head and looked at Tommy. He saw that her eyes were filmed,

vacant, dead. Then of a sudden a third membrane was drawn back across the pupils, and she saw him.

She let the shrimp drop to the ground, uttered a cry, and moved toward him with a tottering gait. She groped toward him with outstretched arms. And then she was blind again, for the membrane once more covered her pupils. It was as if her eyes were unable to endure even the dim light of the valley, through whose surrounding mists the low sun, setting just above the horizon, was unable to diffuse itself save as a brightening of the fog curtain.

Tommy stepped toward the girl. His outstretched hand touched hers. It was unquestionably a woman's hand he held, delicately warm, with exquisitely moulded fingers, in whose touch there seemed to be, for the girl, some tactile impression of him.

Again that membrane was drawn back from the girl's pupils for a fleeting flash. Tommy saw two eyes of intense black, their color contrasting curiously with the flaxen color of her hair and her white skin, almost the tint of an albino's. Those eyes had surveyed him,

and appeared satisfied that he was one of her kind. She could not have seen very much in that almost instantaneous flash of vision. Queer, that membrane—as if she had been used to living in the dark, as if the full light of the day was unbearable!

She drew her hand away. Soft vocals came from her lips. Suddenly she turned swiftly. She could not have seen, but before Tommy had seen, she had sensed the presence of the old man who was creeping out of the hole in the mountainside.

He moved forward craftily, and then pounced upon the sand pile, and in a moment had pulled out another of the big shrimps, which he proceeded to devour with greedy relish. The girl, leaving Tommy's side, joined him in that unpleasant feast.

And in the midst of it a flood came pouring from the hole—a flood of living beetles, covering the ground in fifteen-foot leaps as they dashed at the two.

To his horror, Tommy saw Jimmy Dodd among them, wrapped in his fur coat like a mummy, and being

pushed and rolled forward like a football.

For a moment Tommy hesitated, torn between his solicitude for Jim Dodd and that for the girl. Then, as the foremost of the monsters bounded to her side, he ran between them. The vicious jaws snapped within six inches of Tommy's face, with a force that would have carried away an ear, or shredded the cheek, if they had met.

Tommy struck out with all his might, and his fist clanged on the resounding shell so that the blood spurted from his bruised knuckles. He had struck the monster squarely upon the thorax, and he had not discommoded it in the least. It turned on him, its glassy, many-faceted eyes glaring with a cold, infernal light. Tommy struck out again with his left hand, this time upon the pulpy flesh of the downward-opening mouth.

An inch higher, and he would have impaled his hand upon the beak, with a point like a needle, and evidently used for purposes of attack, since it was not connected with the mandibles. The blow appeared to

fall in the only vulnerable place. The monster dropped upon its back and lay there, unable to reverse itself, its antenna and forelegs waving in the air, and the rear legs rasping together in a shrill, strident shriek.

Instantly, as Tommy darted out of the way, the swarm fell upon the helpless monster and began devouring it, tearing strips of flesh from the lower shell, which in the space of a half-minute was reduced simply to bone. The most horrible feature of this act of cannibalism was the complete silence with which it was performed, except for the rasping of the dying monster's legs. It was evident that the huge beetles had no vocal apparatus.

For the moment left unguarded, Jim Dodd flung down the collar of his fur coat, stared about him, and recognized Tommy.

"My God, it's you!" he yelled. "Well, can you—?"

He had no time to finish his sentence. A pair of antenna went round his neck from behind. At the same instant Tommy, the old man, and the girl were

gripped by the monsters, which, forming a solid phalanx about them, began hustling them in the direction of the hole. Resistance was utterly impossible. Tommy felt as if he was being pushed along by a moving wall of stone.

Inside the opening it was completely dark. Tommy shouted to Dodd, but the strident sounds of the moving legs drowned his cries. He was being pushed forward into the unknown.

Suddenly the ground seemed to fall away beneath his feet. He struggled, cried out, and felt himself descending through the air.

For a full half-minute he went downward at a speed that constricted his throat so that he could hardly draw breath. Then, just as he had nerved himself for the imminent crash, the speed of his descent was checked. In another moment he found that he was slowing to a standstill in mid-air.

He was beginning to float backward—upward. But the wall of moving shells, pushing against him, forced him

on, downward, and yet apparently against the force of gravitation.

Then of a sudden Tommy was aware of a dim light all about him. His feet touched earth and grass as softly as a thistledown alighting.

He found himself seated in the same dim light upon red grass, and staring into Jimmy's face.

Chapter 3: Ten Miles Underground

"What I was going to say when we were interrupted, was, 'Can you beat it?'" Jimmy Dodd observed, with admirable sang-froid.

They were still seated on the red grass, gazing about them at what looked like an illimitable plain, and upward into depths of darkness. It was warm, and the light, furnished by what appeared to be luminous vegetation, was about that of twilight.

On every side were clumps of trees and shrubs, which formed centers of phosphorescent illumination, but

for the most part the land was open, and here and there human figures appeared, moving with head down and arms hanging earthward.

"No, I'm damned if I can," said Tommy. "What happened to you after we crashed?"

"Why, first thing I knew, I found myself riding on the back of a fossil beetle, apparently one of the *curculionidae*," said Dodd.

"Never, mind being so precise, Jimmy. Let's call it a beetle. Go on."

"They set me down inside the hole and seemed to be investigating me, the whole swarm of them. Of course, I thought I was dead, and come to my just reward, especially when I saw those beaks. Then one of them began tickling my face with its antenna, and I drew up my fur collar. They didn't seem to like the feel of the fur, and after a while the whole gang started hustling me back again, like a nest of ants carrying something they don't want outside their hill. And then you bobbed up."

"Well, my opinion is you saved your life by pulling up your collar," said Tommy. "Looks to me as if it's a case of the survival of the fittest, said fittest being the insect, and the human race taking second place. You know what the humans here live on, don't you?"

"No, what?"

"Shrimps as big as poodles. If you'd seen that girl and the old man getting outside them, you'd realize that there seems to be a food shortage in this part of the world. Say, where in thunder are we, Jimmy?"

"Haven't you guessed yet, Travers?" asked Dodd, a spice of malice in his voice.

"I suppose this is some sort of big hole on the site of the south pole, with warm vapors coming up. Maybe a great fissure in the earth, or something."

Jimmy Dodd's grin, seen in the half-light, was rather disconcerting. "How far do you think we dropped just now?" Dodd asked.

"Why, I'd say several hundred yards," replied Tommy.
"What's your estimate?"

"Just about ten miles," answered Dodd.

"What? You're still crazy! Why, we slowed up!"

"Yeah," grinned Dodd, "we slowed up. We're inside the crust of the world. That's the long and short of it. The earth we've known is just a shell over our heads."

"Yeah? Walking head downward, are we? Then why don't we drop to the center of the earth, you damn fool?"

"Because, my dear fellow, you can swing a pailful of water round your head without spilling any of it. In other words, our old friend, centrifugal force. The speed with which the earth is rotating, keeps us on our feet, head downward. To be precise, the center of the earth's gravity lies in the middle of the hollow sphere, of course, but the counteraction of centrifugal force throws it outward to the middle of the ten-mile crust. That's why we slowed down after we were half-

way through. We were moving against gravity."

"And what's up there, or down there, or whatever you call it?" asked Tommy, pointing to what ought to have been the sky.

"Nothing. It's the center of the tennis ball, though I imagine it's pretty near a vacuum when you get up a mile or so, owing to the speed of the earth's rotation, which forces the heat into the shell."

"You mean to say you actually believe that stuff you've been handing me?" asked Tommy, after a pause.

"Then how did human beings get here, and those damn beetles? And why's the grass red?"

"The grass is red because there's no sunlight to produce chlorophyll. The inhabitants of the deep sea are red or black, almost invariably. In the case of the humans, they've become bleached. My belief is that that man and woman we saw, and those"—he pointed to the vague forms of human beings, who moved across the grass, gathering something—"are survivors of the primitive race that still exists as the

Australians. Undoubtedly one of the branches of the human stock originated in antarctica at a time when it enjoyed a tropical temperature, and was the land bridge between Australia and South America."

"And the—beetles?" asked Tommy.

"Ah, they go back to the days when nature was in a more grandiose mood!" replied the archaeologist enthusiastically. "That's the most wonderful discovery of the ages. The world will go crazy over them when we bring back the first living specimens to the zoological parks of the great cities.

"But," Dodd went on, speaking with still more enthusiasm, "of course, this is only the beginning, Tommy. There are ten million species of insects, according to Riley, and it is inevitable that there must be hundreds of thousands of other survivals from the age of the great saurians, perhaps even some of the saurians themselves. Who knows but that we may discover the ancestor of the extinct monotremes, the rhynchocephalia, the pterodactyls, hatch a brood of aepyornis eggs—"

"And," said Tommy tartly, "how are we going to get them back, apart from the little problem of getting out of here ourselves?"

"Don't let's worry about that now," answered Dodd. "It will take ten years of the hardest kind of labor even to begin a classification of the inhabitants of this inner world. I could sit down for ever, and—"

But Jimmy Dodd rose to his feet as a pair of antenna whipped round his neck and jerked him bodily upward.

One of the monster beetles was standing upright behind them, and by its gestures it evidently meant that Dodd and Tommy were to join the crowd of humans in the offing. As Dodd turned upon it with an indignant show of fists, one of the antennae whipped off his fur coat and stung him painfully with the bristle-like attachment at the end.

It was a painful moment when Dodd and Tommy realized that they were powerless against the monstrous beetles.

[Image description start: A black and white illustration showing two men facing off against a giant spotted beetle, with more humans in the background fighting another group of beetles. Image description end.]

Tommy tried the uppercut with which he had knocked out the deceased monster, but the quick jerks of the present beetle's head were infinitely faster than the movements of his fists, while the antenna had a whiplike quality about them that speedily convinced him that discretion was the card to play.

Under the threat of the curling antenna, Tommy and

Dodd moved in the direction of the slowly circulating humans. Numerous tiny rodents, which evidently kept the red grass short, scampered away under their feet. The beetles made no further effort to force them on, but now they could see that a number of the monsters were stationed at intervals around a wide circle, keeping the humans in a single body.

"Good Lord!" ejaculated Tommy, stopping. "See what they're doing, Dodd? They're herding us, like cowboys herd steers. Look at that!"

One of the herd, a male with a long beard, suddenly broke from the herd, bawling, and flung himself upon a beetle guard. The antenna shot forth, coiled around his neck, and hurled him a dozen feet to the ground, where he lay stunned for a moment before arising and rejoining his companions.

"But what are they looking for?" demanded Dodd.

Tommy had not heard him. He had stopped in front of one of the luminous trees and was plucking a fruit from it.

"Jimmy, ever see an apple before?" he asked. "If this isn't an apple, I'll eat my head."

It certainly was an apple, and one of the largest and juiciest that Tommy had ever tasted. It was the reddest apple he had ever seen, and would have won the first prize at any agricultural fair.

"And look at this!" shouted Tommy, plucking an enormous luminous peach from another tree.

They began munching slowly, then, seeing one of the beetle guards approaching them, they moved into the midst of the crowd.

"Did you notice anything strange about those fruit trees?" inquired Dodd, as he munched. "I'll swear they were monocotyledonous, which, after all, is what one would expect. Still, to think that the monocotyledons evolved the familiar drupes, or stone fruits, on a parallel line to the dicotyledons is—amazing!"

A box on the ear like the kick of a mule's hoof jerked

the last word from his lips as he went sprawling. He got up, to see the girl standing before him, intense disgust and anger on her face.

She snatched the fruits from the hands of the two Americans and hurled them away. It was evident from her manner that she considered such diet in the highest degree unclean and disgusting; also that she considered herself charged with the duty of superintending Tommy's and Dodd's education, but especially Dodd's.

Taking him by the arm, she propelled him into the midst of the groping humans. She released him, stooped, and suddenly stood up, a shrimp about eighteen inches long in her hand.

Towering over Dodd by six inches, she took his face in her hands and began caressing him; then, seizing his jaws in her strong fingers, she pried them apart, and popped the tail end of the shrimp into his mouth.

Dodd let out a yelp, and spat out the love-gift, to be rewarded with another box on the ear by the young

Amazon, while Tommy stood by, convulsed with laughter, and yet in considerable trepidation, for fear of being forced to share Dodd's fate.

For the girl was again holding out the tail end of the crustacean, and Jim Dodd's jaws were slowly and reluctantly approaching it.

But suddenly there came an intervention as the strident rasping of beetle legs was heard in the distance. Panic seized the human herd, grovelling for shrimps in the sandy soil with its tufts of red grasses. Milling in an uneasy mob, they cowered under the lashes of the antenna of the beetle guards, which sacrificed their backs through their hair garments whenever any of them tried to bolt.

Nearer and nearer came the beetles, louder and more penetrating the shriek of their rasping legs. Now the swarm came into sight, rank after rank of the shell-clad monsters, leaping fifteen feet at a bound with perfect precision, until they had formed a solid phalanx all around the humans.

Tommy heard sighs of despair, he heard muttering, and then he realized, with deep thankfulness, that these human beings, degraded though they were, had a speech of their own.

In the middle of the front line appeared a beetle a foot taller than the rest. That it was either a king or queen was evident from the respect paid it by the rest of the swarm. At its every movement a bodyguard of beetles moved in unison, forming themselves in a group before it and on either side.

There would have been something ludicrous about these movements, but for the impression of horror that the swarm made upon Tommy and Jim Dodd. Hitherto both had supposed that the hideous insects acted by blind instinct, but now there could no longer be any doubt that they were possessed of an organized intelligence.

The strident sounds grew louder. Already Tommy was beginning to discover certain variations in them. It was dawning upon him that they formed a language—and a perfectly intelligible one. For, as the note

changed about a half-semitone, two of the monsters left the side of their ruler and reached the two men with three successive leaps.

Their movements left no doubt in either Tommy's or Dodd's mind what was required. The two strode hastily toward the assemblage, and stopped as the antenna of their guards came down in menacing fashion.

It was light enough for Tommy to see the face of the ruler of the hellish swarm. And it required all his powers of will to keep from collapsing from sheer horror at what he saw.

For, despite the close-fitting shell, the face of the beetle king was the face of a man—a white man!

Jim Dodd's shriek rang out above the shrilling of the beetle-legs, "Bram! It's you, it's you! My God, it's you, Bram!"

Chapter 4: Bram's Story

A sneering chuckle broke from Bram's lips. "Yes, it's me, James Dodd," he answered. "I'm a little surprised to see you here, Dodd, but I'm mighty glad. Still insane upon the subject of fossil monotremes, I suppose?"

The words came haltingly from Bram's lips, as from those of a man who had lost the habit of easy speech. And Tommy, looking on, and trying to keep in possession of his faculties, had already come to the conclusion that the sounds were inaudible to the beetles. Probably their hearing apparatus was not attuned to such slow vibrations of the human voice.

Also he had discovered that Bram was wearing the discarded shell of one of the monsters: he had not grown the shell himself. It was fastened about his body by a band of the hair-cloth, fastened to the two protuberances of the elytra, or wing-cases, on either side of the dorsal surface.

The discovery at least robbed the situation of one

aspect of terror. Bram, however he had obtained control of the swarm, was still only a man.

"Yes, still insane," answered Dodd bitterly. "Insane enough to go on believing that the polyprotodontia and the dasyuridae, which includes the peramelidae, or bandicoots, and the banded ant-eaters, or myrmecobidae, are not to be found in fossil form, for the excellent reason that they were not represented before the Upper Cretaceous period."

"You lie! You lie!" screamed Bram. "I have shown to all the world that phascalotherium, amphitherium, amblotherium, spalacotherium, and many other orders are to be found in the Upper Jurassic rocks of England, Wyoming, and other places. You—you are the man who denied the existence of the nototherium, of the marsupial lion, in pleistocene deposits! You denied that the dasyuridae can be traced back beyond the pleistocene. And you stand there and lie to me, when you are at my mercy!"

"For God's sake don't aggravate him," whispered Tommy to Dodd. "Don't you see that he's insane?"

Humor him, or we'll be dead men. Think what the world will lose, if you are never able to go back with your specimens," he added craftily.

But Dodd, whose eyes were glaring, said a sublime thing: "I have given my life to science, and I will never deny my master!"

With a screech, which, however, was evidently inaudible to the beetles, Bram leaped at Dodd and seized him by the throat. The two men fell to the ground, the ponderous beetle-shell completely covering them. Underneath it they could be seen to be struggling desperately. All the while the beetle horde remained perfectly motionless. Tommy thought afterward that in this fact lay their brightest chances of escape, if Bram's immediate vengeance did not fall on them.

Either because Bram was not himself a beetle, or because in some other way the swarm instinct was not stirred, the monsters watched the struggle with complete indifference.

At the moment, however, Tommy was only concerned with saving Dodd from the madman. He got his foot beneath the shell, then inserted his leg; using his whole body as a lever, he succeeded in turning Bram over on his back.

Then, and only then, the swarm rushed in upon them. Then Tommy realized that he had touched one of the triggers that regulated the beetle's automatism. In another instant Bram would have been torn to pieces. The needle-beaks were darting through the air, the hideous jaws were snapping. Bram's yells rang through the cavern.

Dodging beneath the avalanche of the monsters, Tommy got Bram upon his feet again. The beetles stopped, every movement arrested. Bram's hand went to the pocket of his tattered coat, there came a snap, a flash. Bram had ignited an automatic cigarette-lighter!

Instantly the monsters went scurrying away into the distance. And Tommy had another clue. The beetles, living in the dimness of the underworld, could not

stand light or fire!

He ran to where Jimmy was lying, face upward, on the ground. His face was badly scarred by Bram's nails, and the blood was spurting from a long gash in his throat, made by the sharp flint that was lying beside him.

He had some time before discarded his fur coat. Now he pulled off his coat, and, tearing off the tail of his shirt, he made a pad and a bandage, with which he attempted to staunch the blood and bind the wound. It must have taken ten minutes before the failing heart force enabled him to get the bleeding under control. Dodd had nearly bled to death, his face was drawn and waxen, but, because the pulsation was so feeble, the artery had ceased to spurt.

Then only did Tommy take notice of Bram. He had been squatting near, and Tommy realized that he had unconsciously observed Bram put some sort of pellets into his mouth. Now he realized that Bram was a drug fiend. That was what had made him walk out of the Greystoke camp in the storm.

Bram got up and came toward them. "Is he dead?" he whispered hoarsely. "I—I lost my temper. You two—I don't intend to kill you. There—there's room for the three of us. I've got—plans of the utmost importance to humanity."

"I don't think much of the way you've started to carry them out," answered Tommy bitterly. "No, he's not dead yet, but I wouldn't give much for his chances, even in the best hospital. The best thing you can do now is to go to hell, and take your beetles with you," he added.

Bram, without replying, raised his head and emitted from his throat the shrillest whistle that Tommy had ever heard. The response was amazing.

Rasping out of the darkness came eight beetles in pairs. Instead of leaping from an upright position, they trotted in the manner of horses, on all fours, their shells, which touched at the edges, forming a solid surface, gently rounded in the center so that a man's body could lie there and fit snugly into the groove.

"Help me get him up," said Bram. "Trust me! I'll do my best for him. If we leave him here they may kill and eat him. I can't trust all those beetle guards."

Tommy hesitated a moment, then decided to follow Bram's suggestion. Together they raised the unconscious man to the beetle-shell couch. Bram seated himself upon the boss of one of the beetle-shells in front, and Tommy jumped up behind.

Next moment, to his amazement, the trained steeds were flying smoothly through the air, at a rate that could not have been less than seventy-five to eighty miles an hour.

Tommy's shell seat was not a bed of roses, but he hardly noticed that. He was thinking that if Dodd lived they should be able to turn the tables.

For, unknown to Bram, he was in possession of the cigarette-lighter which he had picked up, and which Bram, in his agitation, had forgotten. It was full of petrol, or some other fluid of a similar nature, which Bram must have obtained from some natural source

within the earth. And, in an emergency, Tommy knew that he had the means of keeping the beetles at bay.

They had traveled for perhaps an hour when a faint light began to glow in the distance. It grew brighter, and a roaring sound became audible. A turn of the track that they were traversing, and the light became a glare. A terrific sight met Tommy's eyes.

Out of the bowels of the earth—actually out of the crust beneath their feet—there shot a pillar of roaring flame, of intense white color, and radiating a heat that was perceptible even at a distance of several hundred yards. The beetle steeds dropped gently to the ground; they halted. Bram got down, grinning.

"Nicely trained horses, what?" he asked. "By the way, you have the advantage of me in names. Who and what are you?"

Tommy told him.

"Well, Travers, it looks as if we're going to be companions for some time to come, and I quite admit

you saved my life back there. So we don't want to start with secrets. This is a natural petrol spring, which has probably been burning undiminished for ages. My trained beetles are blind—you didn't happen to notice I'd cut off their antenna? But the rest of the swarm daren't come near it. So that makes me their master.

"Pretty trick, what, Travers? I'm the Lord of the Flame down here, and I'm using my advantage. But don't get the idea of supplanting me. There are lots of other tricks you don't know anything about, and I'll have to trust you better before—"

He broke off and slipped another pellet into his mouth.

"Help me get Dodd down, if this is our destination," answered Tommy.

They lifted Dodd to the ground. He was conscious now, and moaning for water. The two men carried him into a sort of large cavern, at the farther end of which the fire was roaring. Bram went to a spring that

trickled down one side, filled something that looked like a petrified lily calyx, and brought it to Dodd, who drained it.

Tommy looked about him. He was astonished to see that the place was, in a way, furnished. Bram had carved out a very creditable couch, and several low chairs, evidently with a stone ax, for by the light of the fire, which cast a fair illumination even at that distance, Tommy could see the marks of the implement, rough and irregular, in the wood.

On the ground were thick rugs, woven of hair, and two or three more rugs of the same material lay on the couch. It was evident that the human herd was expected to furnish textile materials as well as meat.

"Sit down, and make yourself comfortable," said Bram, when they had raised Dodd to the couch. "We'll have dinner, and then we'll talk. I can give you a fine vegetarian meal. Those dirty shrimp-eating savages look on me as a cannibal because I eat the fruits of the trees." He grinned. "There's a bad shortage of food in Submundia, as I've named this part of the

world," he went on, "for until I came the beetles simply devoured the humans wholesale, instead of breeding them, like I taught them. And there's another of the hundred-and-fifty year swarms due to hatch out soon. However, we'll talk about that later. And all those fine fruits going to waste! Excuse me, Travers."

He disappeared, and returned in a minute or two with a small table, piled high with luscious fruits unknown to Tommy, though among them were some that looked like loaves of natural bread.

Tommy, whose appetite never failed him even in the worst circumstances, fell to with a will. He was enjoying his meal when he happened to look up, and saw that the penumbra at the edge of the lighted zone was dense with beetles.

Thousands—perhaps millions, for they stretched away as far as the eye could see, were packed together, their antenna waving in unison, their heads, beneath the shells, directed toward the fire.

Bram saw Tommy's look of disgust, and laughed. "The fire seems to intoxicate them, Travers," he said. "They always throng the entrance when I'm here. It's as far as they dare go. They're quite blind in the least light. Care to smoke? I've learned the art of making some quite decent cigars." He produced a handful. "Oh, by the way, you didn't see my lighter anywhere, did you?" he went on, with a pretense of carelessness.

"No," lied Tommy. "I was surprised you—"

"Oh, there's a supply of petrol in the rocks. No matter," answered Bram carelessly. "Your friend looks bad," he added, glancing at Dodd, who had fallen asleep. "Travers, I'm sorry I lost my temper. The—the shock of meeting men from the upper world, you know."

Dodd opened his eyes and tried to whisper. Tommy bent over him and listened.

"He wants to know whether he can have that girl to take care of him," he said.

"What, the one I saw you with? Why, she's a cull, Travers."

"What d'you mean?" asked Tommy.

"Why—useless, you know. There's several of them running loose, and waiting to be rounded up. We raise two breeds, one for replenishing the stock, and one for meat. She's just a cull, a reversion, no use for either purpose. I'll have her brought by all means. I—I like Dodd. I want to get him to like me," Bram went on, with a sort of penitence that had a pathetic touch. "Our little differences—quite absurd, and I can prove he's wrong in his ideas."

"Make yourself comfortable as long as you're here, Travers, and don't mind me. Only, don't try to escape. The beetles will get you if you do, and there's no way out of here—none that you'll find. And don't try to follow me. But you're a sensible man, and we'll all get along famously, I'm sure, as soon as Dodd recovers."

Chapter 5: Doomed!

There were no means known to Tommy of reckoning time in that strange place of twilight. His watch had been broken in the airplane fall; and Dodd never remembered to wind his, but they estimated that about two weeks had passed, judging from the number of times they had slept and eaten.

In those two weeks they had gradually begun to grow accustomed to their surroundings. Haidia, the girl, had arrived on beetle-back within an hour after Bram's departure, apparently into a cleft of the rocks—how he had communicated his order to the beetle steeds Tommy had no idea. And under the girl's ministrations Dodd was making good progress toward recovery.

That Haidia was in love with Dodd in quite a human way was evident. To please the girl, both Dodd and Tommy had learned to eat the raw shrimps, which, being bloodless, were really no worse than oysters, and had a flavor half-way between shrimp and crawfish. To please the men, Haidia tried not to

shudder when she saw them devouring the breadfruit and nectarines of which Bram always had a plentiful supply. Bram was solicitous in his inquiries for Dodd's health.

"Jim, I've been thinking about our chances of getting away," said Tommy one morning. "It's evident Bram's only waiting for your recovery to put some proposition up to us. Suppose you were to feign paralysis."

"How d'you mean? What for?" demanded Dodd.

"If he thinks you're helpless, he'll be less on his guard. You haven't walked about in his presence." That was true, for the activities of the two had been nocturnal, when Bram had vanished. "Let him think a nerve's been severed in your neck, or something of the sort. If it doesn't work, you can always get better."

Dodd's realistic portrayal of a man with a partly paralyzed right side brought cries of horror from Bram next morning. Solicitously he helped Dodd back to the couch. Bram, when not under the influence of

his drug, had moments of human feeling.

"Can't you move that arm and leg at all, Dodd?" he asked. "No feeling in them?"

"There's plenty of feeling," growled Dodd, "but they don't seem to work, that's all."

"You'll get better," said Bram eagerly. "You must get better. I need you, Dodd, in spite of our differences. There's work for all of us, wonderful work. A new humanity, waiting to be born, Dodd, not of the miserable ape race, but of—of—"

He checked himself, and a cunning look came over his face. He turned away abruptly.

At the end of two weeks or so, an amazing thing happened. One day Haidia, with a look of triumph in her eyes, addressed Dodd with a few English words!

Her brain, which had probably developed certain faculties in different proportions from those of the upper human race, had registered every word that

either of the two men had ever spoken, and remembered it. As soon as Dodd ascertained this, he began to instruct her, and, with her abnormal faculties of memory, it was not long before she could talk quite intelligently. The obstacle that had stood between them was swept away. She became one of themselves.

In the days that followed the girl told them brokenly something of the history of her race, of the legend of the universal flood that had driven them down into the bowels of the earth, of the centuries-long struggle with the beetles, and of the insects' gradual conquest of humanity, and the final reduction of the human race to a miserable, helpless remnant.

Everywhere, Haidia told them, were beetle swarms, everywhere humanity had been reduced to a few handfuls. Bram, by breeding mankind from prolific strains, and using the new-born progeny for food, had temporarily averted universal starvation. But a new swarm of beetles was due to hatch out shortly, and then—

The girl, with a shudder, put her hand to her bosom, and brought out a little bright-eyed lizard.

"The old man you saw with me, who is one of our wise elders, has told our people that these things feed upon the beetle larvae," she said. "We are putting them secretly into the nests. But what can a few lizards do against millions." She looked up. "In the earth above us, the beetle larvae extend for miles, in a solid mass," she said. "When they come out as beetles, it will be the end of all of us."

Bram had grown less suspicious as the time passed. His sudden visits to the cavern had ceased. Dodd and Tommy knew that he spent the nights—if they could be termed nights—lying in a drugged slumber somewhere among the rocks. They had asked Haidia whether there was any way of escape into the upper world.

"There are two ways from here," answered the girl. "One is the way you came, but it is impossible to pass the beetle guards without being torn to pieces. The other—"

She shuddered, and for an instant drew back the film from across her pupils, then uttered a little cry of pain at the light, dim though it was.

"There is a bridge across that terrible monster that devours all it touches," she said, shuddering, meaning the fire.

Suddenly Dodd had an inspiration. He still had the fur coat that he had worn, and, reaching into a pocket he drew out a pair of snow goggles, which he adjusted over Haidia's nose.

"Now look!" he said.

Haidia looked, blinked and, with an effort kept her eyes open. She gazed at Dodd in amazement. Dodd laughed, and pulled her toward him. He kissed her, and Haidia's eyes closed.

"What is this?" she murmured. "First you give me medicine that opens my eyes, and then you give me medicine that closes them."

"That's nothing," grinned Dodd. "Wait till you understand me better."

Bram's eyes were preternaturally bright. It was evident that he had been increasing his dose of late, and that he was fully under the influence of it now.

"Well, gentlemen, the time has come for us to be frank with one another," he said, as the three were gathered about the little table, while Haidia crouched in a far corner of the cave. "I want you to work for me in my plans for the regeneration of humanity. The time for which I have long labored is almost at hand. Any day now the new swarm of beetles may emerge from the pupal stage. But before I speak further, come and see them, gentlemen!"

He rose, and Dodd and Tommy rose too, Tommy supporting Dodd, who let his arm and leg trail awkwardly as he moved.

Bram led the way into the cleft among the rocks into which he had been in the habit of passing. Beyond this opening the two men saw another smaller cavern,

with a beetle guard standing on either side, antenna waving.

Bram shrilled a sound, and the antenna dropped. The three passed through. Tommy saw a hair-cloth pallet set against the rocks, a table, and a chair. Beyond was a sloping ramp of earth. Overhead was a rock ceiling.

Bram led the way up the ramp, and the three stepped through a gap in the rocks and found themselves on an extensive prairie. But in place of the red grass there was a vast sea of mud.

By the light cast by the petrol fire, which roared up in the distance, a veritable fiery fountain, the two Americans could see that the mud was filled with huge encysted forms, grubs three or four feet long, motionless in the soil.

Bram scooped up one of them and tossed it into the air. It thudded to their feet and remained motionless.

"As far as you can see, and for miles beyond, these pupae of the beetles lie buried in the decaying

vegetation in which the eggs were hatched," said Bram. "Every century and a half, so far as I have been able to judge from comparative anatomy, a fresh swarm emerges. See!"

He pointed to the pupa he had unearthed, which, as if stirred into activity by his handling, was now beginning to move. Or, rather, something was moving inside the cocoon.

The shell broke, and the hideous head and folded antenna of a beetle appeared. With a convulsive writhing, the monster threw off the covering and stepped out. It extended its wings, glistening, with moisture, from the still soft and pliant carapace, or shell, and suddenly zoomed off into the distance.

Tommy shuddered as the boom of its flight grew softer and subsided.

"Any day now the entire swarm will emerge," cried Bram. "How many moultings they undergo before they undergo the finished state, I do not know, but already, as you see, they are prepared for the battle of

life. They emerge ravenous. That beetle will fall upon the man-herds and devour a full grown man, unless the guards destroy it."

He raised his arms with the gesture of an ancient prophet. "Woe to the human race," he cried, "the wretched ape spawn that has cast out its teachers and persecuted those who sought to raise it to higher things!"

Tommy knew that Bram was referring to himself. Bram turned fiercely upon Dodd.

"When I joined the Greystoke expedition," he cried, "it was with the express intention of refuting your miserable theories as to the fossil monotremes. I could not sleep or eat, so deeply was I affronted by them. For, if they were true, the dasyuridae are an innovation in the great scheme of nature, and man, instead of being a mere afterthought, a jest of the Creative Force, came to earth with a purpose.

"That I deny," he yelled. "Man is a joke. Nature made him when she was tired, as the architect of a

cathedral fashions a gargoyle in a sportive moment. It is the insect, not man, who is the predestined lord of the ages!"

And for once in his life, perhaps because at this point Tommy dug him violently in the ribs, Dodd had the sense to remain silent. Bram led the way swiftly back into the larger cave.

"When this swarm hatches out," he said, "I calculate that there will be a trillion beetles seeking food. There is no food for a tithe of them here underneath the earth. What then? Do you realize their stupendous power, their invincibility?"

"No, you don't realize it, because your minds, through long habit, are only attuned to think in terms of man. All man's long history of slaughter of the so-called lower creatures obsesses you, blinds your understanding. A beetle? Something to be trodden underfoot, crushed in sport! But I tell you, gentlemen, that nature—God, if you will—has designed to supplant the man-ape by the beetle.

"He has resolved to throw down the wretched so-called intelligence of your kind and mine, and supplant it by the divine instinct of the beetle, an instinct that is infinitely superior, because it arrives at results instantaneously. It knows where man infers. Attuned closely to nature, it alone is able to fulfil the divine plan of Creation."

Bram was certainly under the influence of his drug; nevertheless, so violent were his gestures, so inspired was his utterance, that Tommy and Dodd listened almost in awe.

"They are invincible," Bram went on. "Their fecundity is such that when the new swarm is hatched out their numbers alone will make them irresistible. They do not know fear. They shrink from nothing. And they will follow me, their leader—I, who know the means of controlling them. How, then, can puny man hope to stand against them?"

"Join me, gentlemen," Bram went on. "And beware how you decide rashly. For this is the supreme moment, not only of your own lives, but for all

humanity and beetledom. Upon your decision hangs the future of the world.

"For, irresistible as the beetles are, there is one thing they lack. That is the sense of historic continuity. If they destroy man, they will know nothing of man's achievements, poor though these are. My own work on the fossil monotremes—"

"Which is a tissue of inaccuracies and half-baked deductions!" shouted Dodd.

Bram started as if a whip had lashed him. "Liar!" he bawled. "Do you think that I, who left the Greystoke expedition in a howling blizzard because I knew that here, in the inner earth, I could refute your miserable impostures—do you think that I am in the mood to listen to your wretched farrago of impossibilities?"

"Listen to me," bawled Dodd, advancing with waving arms. "Once and for all, let me tell you that your deductions are all based upon fallacious premises. No, I will not shut up, Tom Travers! You want me to aid your damned beetles in the destruction of

humanity! I tell you that your phascalotherium, amphitherium, and all the rest of them, including the marsupial lion, are degenerate developments of the age following the pleistocene. I say the whole insect world was made to fertilize the plant world, so that it should bear fruit for human food. Man is the summit of the scale of evolution, and I will never join in any infamous scheme for his destruction."

Bram glared at Dodd like a madman. Three times he opened his mouth to speak, but only inarticulate sounds came from his throat. And when at last he did speak, he said something that neither Dodd nor Tommy had anticipated.

"It looks as if you're not so paralysed as you made out," he sneered. "You'll change your mind within what used to be called a day, Dodd. You'll crawl to my feet and beg for pardon. And you'll recant your lying theories about the fossil monotremes, or you die—the pair of you—you die!"

Chapter 6: Escape!

"I heard what he said. You shall not die. We shall go away to your place, where there are no beetles to eat us, even if"—Haidia shuddered—"even if we have to cross the bridge of fire, beyond which, they tell me, lies freedom."

High over and a little to one side of the petrol flame Dodd and Tommy had seen the slender arch of rock leading into another cleft in the rocks. They had investigated it several times, but always the fierce heat had driven them back.

Both Dodd and Tommy had noticed, however, that at times the fire seemed to shrink in volume and intensity. Observation had shown them that these times were periodical, recurring about every twelve hours.

"I think I've got the clue, Tommy," said Dodd, as the three watched the fiery fountain and speculated on the possibility of escape. "That flow of petrol is controlled, like the tides on earth, by the pull of the

moon. Just now it is at its height. I've noticed that it loses pretty nearly half its volume at its alternating phase. If I'm right, we'll make the attempt in about twelve hours."

"Bram's given us twenty-four," said Tommy. "But how about getting Haidia across?"

"I go where you go," said Haidia, sidling up to Dodd and looking down upon him lovingly. "I do not afraid of the fire. If it burn me up, I go to the good place."

"Where's that, Haidia?" asked Dodd.

"When we die, we go to a place where it is always dark and there are no beetles, and the ground is full of shrimps. We leave our bodies behind, like the beetles, and fly about happy for ever."

"Not a bad sort of place," said Dodd, squeezing Haidia's arm. "If you think you're ready to try to cross the bridge, we'll start as soon as the fire gets lower."

"I'll be on the job," answered Haidia, unconsciously

reproducing a phrase of Tommy's.

The girl glided away, and disappeared through the thick of the beetle crowd clustered about the entrance to the cavern. Tommy and Dodd had already discovered that it was through her ability to reproduce a certain beetle sound meaning "not good to eat" that the girl could come and go. They had once tried it on their own account, and had narrowly escaped the lashing tentacles.

After that there was nothing to do but wait. Three or four hours must have passed when Bram returned from his inner cave.

"Well, Dodd, have you experienced a change of heart?" he sneered. "If you knew what's in store for you, maybe you'd come to the conclusion that you've been too cocksure about the monotremes. We're slaughtering in the morning."

"That so?" asked Dodd.

"That's so," shouted Bram. "The beetles are beginning

to emerge from the pupae, and they'll need food if they're to be kept quiet. We're rounding up about threescore of the culls—your friend Haidia will be among them. We've got some caged ichneumon flies, pretty little things only a foot long, which will sting them in certain nerve centers, rendering them powerless to move. Then we shall bury them, standing up, in the vegetable mould, for the beetles to devour alive, as soon as they come out of the shells. You'll feel pretty, Dodd, standing there unable to move, with the new born beetles biting chunks out of you."

Tommy shuddered, despite his hopes of their escaping. Bram, for a scientist, had a grim and picturesque imagination.

"Dodd, there is no personal quarrel between us," Bram went on. Again that note of pathetic pleading came into his voice. "Give up your mad ideas. Admit that the banded ant-eater, at least, existed before the pleistocene epoch, and everything can be settled. When you see what my beetles are going to do to humanity, you'll be proud to join us. Only make a beginning. You remember the point I made in my

paper, about spalacotherium in the Upper Jurassic rocks. It would convince anybody but a hardened fanatic."

"I read your paper, and I saw your so-called spalacotherium, reconstructed from what you called a jaw-bone," shouted Dodd. "That so-called jaw-bone was a lump of chalk, made porous by water, and the rest was in your imagination. Do your worst, Bram, I'll never crucify truth to save my life. And I'll laugh at your spalacotherium when your beetles are eating me."

Bram yelled and shrieked, he stamped up and down the cavern, shaking his fists at Dodd. At last, with a final torrent of objurgation, he disappeared.

"A pleasant customer," said Tommy. "We'll have to make that bridge, Jim, no question about it, even if it means death in the petrol fire."

"Fire's dying down fast," answered Dodd. "Haidia ought to be here soon."

"If Bram hasn't got her."

"Bram got—that girl? If Bram harms a hair of her head I'll kill him with worse tortures than he's ever dreamed of," answered Dodd, leaping up, white with rage.

"You mean you—?" Tommy began.

"Love her? Yes, I love her," shouted Dodd. "She's a girl in a million. Just the sort of helpmate I need to assist me in my work when we get back. I tell you, Tommy, I didn't know what love meant before I saw Haidia. I laughed at it as a romantic notion. 'Oh lyric love, half angel and half bird!'" he quoted, beginning to stride up and down the cavern, while Tommy watched him in amazement.

And at this moment a complete beetle entered the cave. Complete, because it had a plastron, or breast-shell, as well as a back-shell, or carapace.

A double breast-shell! A new species of beetle? An executioner beetle, sent by Bram to summon them to

the torture? Tommy shuddered, but Dodd, lost in his love ecstasy, was ignorant of the creature's advent.

"Oh lyric love—" he shouted again, as he twirled on his heel, to run smack into the monster. The crack of Dodd's head against the beetle-shell re-echoed through the cave.

The double plastron dropped, the carapace fell down: Haidia stood revealed. The lovers, folded in each other's arms, passed momentarily into a trance.

It was Tommy who separated them. "We'll have to make a move," he said. "I think the fire's as low as it ever gets. Why did you bring the shells, Haidia?"

"To save us all from the beetles," answered the girl. "When they see us in the shells, they will not know we are human. That is what makes it so hard to have to be eaten by those beetles, when they are such dumb-bells," she added, reproducing another of Tommy's words.

"Come," she continued bravely, "let us see if we can

pass the fire."

The roaring fountain made the air a veritable inferno. Overhead the rocks were red-hot. A cascade of sparks tumbled in a fiery shower from the rock roof. Dodd, holding Haidia in his arms, to protect her, staggered ahead, with Tommy in the rear. Only the beetle-shells, which acted as non-conductors of the heat, made that fiery passage possible.

There was one moment when it seemed to Tommy as if he must let go, and drop into that raging furnace underneath. He heard Dodd bawling hoarsely in front of him, he nerved himself to a last effort, beating fiercely at his blazing hair—and then the heat was past, and he had dropped unconscious upon a bed of cool earth beside a rushing river.

He was vaguely aware of being carried in Dodd's arms, but a long time seemed to have passed before he grew conscious again. He opened his eyes in utter darkness. Dodd was whispering in his ear.

"Tommy, old man, how are you feeling now?" Dodd

asked.

"All—right," Tommy muttered. "How's Haidia?"

"Still unconscious, poor girl. We've got to get out of here. I heard Bram yelling in the distance. He's discovered our flight. There may be another way out of the cave, and, if so, he'll stop at nothing to get us. See if you can stand, but keep your head low. There's a low roof of rock above us."

"There's water," said Tommy, listening to the roar of a torrent that seemed to be rushing past them.

"It's a stream, and I believe these shells will float and bear our weight. We've got to try. We've got to put everything to the touch now, Tommy. I'm going to lay Haidia on one of the shells, poor girl, and start her off. Then I'll follow, and you can bring up the rear."

"I'm with you," said Tommy, getting upon his feet, and uttering an exclamation of pain as, forgetful of Dodd's injunction, he let his head strike the rock roof overhead.

In the darkness he felt the outlines of his beetle-shell lying beside the torrent. He could hear Dodd in front of him, grunting as he raised Haidia's unconscious form in his arms and deposited her in her shell. Tommy got his own shell into the stream, and held it there as the waters swirled around it.

"Ready?" he heard Dodd call.

Before he could answer, there sounded from not far away, yet strangely muffled by the rocks, Bram's bellow of fury. Bram was evidently fully drugged and beside himself. Inarticulate threats came floating through the rocky chamber.

"Bram seems to have lost his head temporarily," called Dodd, laughing. "A madman, Tommy. He insists that the marsupial lion—"

"Yes, I heard you telling him about it," answered Tommy. "You handed it to him straight. However, more about the marsupial lion later. I'm ready."

"Then let 'er go," called Dodd, and his words were

swallowed up by the sound of the hollow shell striking against the rocky bank as he launched his strange craft into the water.

Tommy set one foot into the hollow of his shell, and let himself go.

Instantly the shell shot forward with fearful velocity. It was all Tommy could do to balance himself, for it seemed more unstable than a canoe. Once or twice he thought he heard Dodd shouting ahead of him, but his cries were drowned in the rush of the torrent.

Suddenly a light appeared in the distance. Tommy thought it was another of the petroleum fountains, and his heart seemed to stand still. But then he gave a gasp of relief. It was a cluster of luminous fungi, ten or twelve feet tall, emitting a glow equal to that of a dozen 40-watt electric bulbs.

By that infernal light Tommy could see that the stream curved sharply. It was about fifty feet in width, and the low rock roof had receded to some fifteen feet overhead. Instead of a tunnel, there was nothing on

either side of them but a vast tract of marshy ground thinly coated with the red grass.

As Tommy looked, he saw the shell that carried the unconscious body of Haidia strike the bank beside the phosphorescent growth. He could see the girl lying in the hollow of the shell, as pale as death, her eyes closed. Dodd was close behind. As the swirl of the current caught his shell, he turned to shout a warning to Tommy.

And Tommy noticed a singular thing, of which his sense of balance had already warned him, though he had hardly given conscious thought to the matter. *The river was running up-hill!*

Of course it was, since the center of gravity was in the shell of the earth, and not in the center!

But, again, the shell of the earth was under their feet!

Then Tommy hit on the solution to the problem. If the river was running up-hill, that meant that they must be near the exterior of the earth. In other words, they

had passed the center of gravity: they must be within a mile or so of the exit from Submundia!

Tommy was about to shout his discovery to Dodd when his shell grounded beside the two others, at the base of the clump of fungi.

Huge, straight, hollow stems they were, with mushroom caps, and, like all fungi, fly-blown, for Tommy could see worms nearly a foot in length crawling in and out of the porous stalks. The stench from the growth was nauseating and overpowering, utterly sickening.

"Push off and let's get out of here!" Tommy called to Dodd, who was balancing his shell against the bank, and trying to peer into Haidia's face.

At that moment he caught sight of something that made his blood turn cold!

It was an insect fully fifteen feet in height, three times that of a beetle, lurking among the fungi. He saw a hugely elongated neck, a three-cornered head with a

pair of tentacles, and two pairs of legs as long as a giraffe's. But what gave the added touch of horror was that the monster, balancing itself on its hind legs, had its forelegs extended in the attitude of one holding a prayer-book!

That attitude of devotion was so terrible that Tommy uttered a wild cry of terror. At the same time another cry broke from Dodd's lips.

"God, a praying mantis!" he shouted, struggling madly to push off his shell and Haidia's.

The next moment, as if shot from a catapult, the hideous monster launched itself into the air straight toward them.

Chapter 7: Through the Inferno

Fortunately, the monster miscalculated its leap. The huge legs, whirling through the air, came within a few inches of Tommy's head, but passed over him, and the mantis plunged into the stream. Instantly the water was alive with leaping things with faces of such grotesque horror that Tommy sat paralyzed in his rocking shell, unable to avert his eyes.

Things no more than a foot or two in length, to judge from the slender, eel-like bodies that leaped into the air, but things with catfish heads and tentacles, and eyes waving on stalks; things with clawlike appendages to their ventral fins, and mouths that widened to fearful size, so that the whole head seemed to disappear above them, disclosing fangs like wolves'. Instantly the water was churned into phosphorescent fire as they precipitated themselves upon the struggling mantis, whose enormous form, extending halfway from shore to shore, was covered with the river monsters, gnawing, rending, tearing.

Luckily the struggles of the dying monster carried it

downstream instead of up. In a few moments the immediate danger was past. And suddenly Haidia awoke, sat up.

"Where are we?" she cried. "Oh, I can see! I can see! Something has burned away from my eyes! I know this place. A wise man of my people once came here, and returned to tell of it. We must go on. Soon we shall be safe on the wide river. But there is another way that leads to here. We must go on! We must go on!"

Even as she spoke they heard the distant rasping of the beetle-legs. And before the shells were well in mid-current they saw the beetle horde coming round the bend; in the front of them Bram, reclining on his shell couch, and drawn by the eight trained beetles.

Bram saw the fugitives, and a roar of ironic mirth broke from his lips, resounding high above the strident rasping of the beetle-legs, and roaring over the marshes.

"I've got you, Dodd and Travers," he bellowed, as the

trained beetles hovered above the shell canoes. "You thought you were clever, but you're at my mercy. Now's your last chance, Dodd. I'll save you still if you'll submit to me, if you'll admit that there were fossil monotremes before the pleistocene epoch. Come, it's so simple! Say it after me: 'The marsupial lion—'"

"You go to hell!" yelled Dodd, nearly upsetting his shell as he shook his fist at his enemy.

High above the rasping sound came Bram's shrill whistle. Just audible to human ears, though probably sounding like the roar of thunder to those of the beetles, there was no need to wonder what it was.

It was the call to slaughter.

Like a black cloud the beetles shot forward. A serried phalanx covered the two men and the girl, hovering a few feet overhead, the long legs dangling to within arm's reach. And a terrible cry of fear broke from Haidia's lips.

Suddenly Tommy remembered Bram's cigarette-lighter. He pulled it from his pocket and ignited it.

Small as the flame was, it was actinically much more powerful than the brighter phosphorescence of the fungi behind them. The beetle-cloud overhead parted. The strident sound was broken into a confused buzzing as the terrified, blinded beetles plopped into the stream.

None of them, fortunately, fell into either of the three shells, but the mass of struggling monsters in the water was hardly less formidable to the safety of the occupants than that menacing cloud overhead.

"Get clear!" Tommy yelled to Dodd, trying to help the shell along with his hands.

He heard Bram's cry of baffled rage, and, looking backward, could not refrain from a laugh of triumph. Bram's trained steeds had taken fright and upset him. Bram had fallen into the red mud beside the stream, from which he was struggling up, plastered from head to feet, and shaking his fists and evidently

cursing, though his words could not be heard.

"How about your marsupial lion now, Bram?" yelled Dodd. "No monotremes before the pleistocene! D'you get that? That's my slogan now and for ever more!"

Bram shrieked and raved, and seemed to be inciting the beetles to a renewed assault. The air was still thick with them, but Tommy was waving the cigarette-lighter in a flaming arc, which cleared the way for them.

Then suddenly came disaster. The flame went out! Tommy closed the lighter with a snap and opened it. In vain. In his excitement he must have spilled all the contents, for it would not catch.

Bram saw and yelled derision. The beetle-cloud was thickening. Tommy, now abreast of his companions on the widening stream, saw the imminent end.

And then once more fate intervened. For, leaping through the air out of the places where they had lain concealed, six mantises launched themselves at their

beetle prey.

Those awful bounds of the long-legged monsters, the scourges of the insect world, carried them clear from one bank to the other—fortunately for the occupants of the shells. In an instant the beetle-cloud dissolved. And it had all happened in a few seconds. Before Dodd or Tommy had quite taken in the situation, the mantises, each carrying a victim in its grooved legs, had vanished like the beetles. There was no sign of Bram. The three were alone upon the face of the stream, which went swirling upward into renewed darkness.

Tommy saw Dodd bend toward Haidia as she lay on her shell couch. He heard the sound of a noisy kiss. And he lay back in the hollow of his shell, with the feeling that nothing that could happen in the future could be worse than what they had passed through.

Days went by, days when the sense of dawning freedom filled their hearts with hope. Haidia told Dodd and Tommy that, according to the legends of her people, the river ran into the world from which

they had been driven by the floods, ages before.

There had been no further signs of Bram or the beetle horde, and Dodd and Tommy surmised that it had been disorganized by the attack of the mantises, and that Bram was engaged in regaining his control over it. But neither of them believed that the respite would be a long one, and for that reason they rested ashore only for the briefest intervals, just long enough to snatch a little sleep, and to eat some of the shrimps that Haidia was adept at finding—or to pull some juicy fruit surreptitiously from a tree.

Incidents there were, nevertheless, during those days. For hours their shells were followed by a school of the luminous river monsters, which, nevertheless, made no attempt to attack them. And once, hearing a cry from Haidia, as she was gathering shrimps, Dodd ran forward to see her battling furiously with a luminous scorpion, eight feet in length, that had sprung at her from its lurking place behind a pear shrub.

Dodd succeeded in stunning and dispatching the monster without suffering any injury from it, but the

strain of the period was beginning to tell on all of them. Worst of all, they seemed to have left all the luminous vegetation behind them, and were entering a region of almost total darkness, in which Haidia had to be their eyes.

Something had happened to the girl's sight in the journey over the petrol spring. As a matter of fact, the third, or nictitating membrane, which the humans of Submundia possessed, in common with birds, had been burned away. Haidia could see as well as ever in the dark, but she could bear more light than formerly as well. Unobtrusively she assumed command of the party. She anticipated their wants, dug shrimps in the darkness, and fed Tommy and Dodd with her own hands.

"God, what a girl!" breathed Dodd to his friend. "I've always had the reputation of being a woman-hater, Tommy, but once I get that girl to civilization I'm going to take her to the nearest Little Church Around the Corner in record time."

"I wish you luck, old man, I'm sure," answered

Tommy. Dodd's words did not seem strange to him. Civilization was growing very remote to him, and Broadway seemed like a memory of some previous incarnation.

The river was growing narrower again, and swifter, too. On the last day, or night, of their journey—though they did not know that it was to be their last—it swirled so fiercely that it threatened every moment to upset their beetle-shells. Suddenly Tommy began to feel giddy. He gripped the side of his shell with his hand.

"Tommy, we're going round!" shouted Dodd in front of him.

There was no longer any doubt of it. The shells were revolving in a vortex of rushing, foaming water.

"Haidia!" they shouted.

The girl's voice came back thickly across the roaring torrent. The circles grew smaller. Tommy knew that he was being sucked nearer and nearer to the edge of

some terrific whirlpool in that inky blackness. Now he could no longer hear Dodd's shouts, and the shell was tipping so that he could feel the water rushing along the edge of it. But for the exercise of centrifugal force he would have been flung from his perilous seat, for he was leaning inward at an angle of forty-five degrees.

Then suddenly his progress was arrested. He felt the shell being drawn to the shore. He leaped out, and Haidia's strong hands dragged the shell out of the torrent, while Tommy sank down, gasping.

"What's the matter?" he heard Dodd demanding.

"There is no more river," said Haidia calmly. "It goes into a hole in the ground. So much I have heard from the wise men of my people. They say that it is near such a place that they fled from the flood in years gone by."

"Then we're near safety," shouted Tommy. "That river must emerge as a stream somewhere in the upper world, Dodd. I wonder where the road lies."

"There is a road here," came Haidia's calm voice. "Let us put on our shells again, since who knows whether there may not be beetles here."

"Did you ever see such a girl as that?" demanded Dodd ecstatically. "First she saves our lives, and then she thinks of everything. Good lord, she'll remember my meals, and to wind my watch for me, and—and—"

But Haidia's voice, some distance ahead, interrupted Dodd's soliloquy, and, hoisting the beetle-shells upon their backs, they started along the rough trail that they could feel with their feet over the stony ground. It was still as dark as pitch, but soon they found themselves traveling up a sunken way that was evidently a dry watercourse. And now and again Haidia's reassuring voice would come from in front of them.

The road grew steeper. There could no longer be any doubt that they were ascending toward the surface of the earth. But even the weight of the beetle-shells and the steepness could not account for the feeling of intense weakness that took possession of them. Time

and again they stopped, panting.

"We must be very near the surface, Dodd," said Tommy. "We've surely passed the center of gravity. That's what makes it so difficult."

"Come on," Haidia said in her quiet voice, stretching out her hand through the darkness. And for very shame they had to follow her.

On and on, hour after hour, up the steep ascent, resting only long enough to make them realize their utter fatigue. On because Haidia was leading them, and because in the belief that they were about to leave that awful land behind them their desires lent new strength to their limbs continuously.

Suddenly Haidia uttered a fearful cry. Her ears had caught what became apparent to Dodd and Jimmy several seconds later.

Far down in the hollow of the earth, increased by the echoes that came rumbling up, they heard the distant, strident rasp of the beetle swarm.

Then it was Dodd's turn to support Haidia and whisper consolation in her ears. No thought of resting now. If they were to be overwhelmed at last by the monsters, they meant to be overwhelmed in the upper air.

It was growing insufferably hot. Blasts of air, as if from a furnace, began to rush up and down past them. And the trail was growing steeper still, and slippery as glass.

"What is it, Jim?" Tommy panted, as Dodd, leaving Haidia for a moment, came back to him.

"I'd say lava," Dodd answered. "If only one could see something! I don't know how she finds her way. My impression is that we are coming out through the interior of an extinct volcano."

"But where are there volcanoes in the south polar regions?" inquired Tommy.

"There are Mount Erebus and Mount Terror, in South Victoria Land, active volcanoes discovered by Sir

James Ross in 1841, and again by Borchgrevink, in 1899. If that's where we're coming out—well, Tommy, we're doomed, because it's the heart of the polar continent. We might as well turn back."

"But we won't turn back," said Tommy. "I'm damned if we do."

"We're damned if we don't," said Dodd.

"Come along please!" sang Haidia's voice high up the slope.

They struggled on. And now a faint luminosity was beginning to penetrate that infernal darkness. The rasping of the beetle-legs, too, was no longer audible. Perhaps they had thrown Bram off their track! Perhaps in the darkness he had not known which way they had gone after leaving the whirlpool!

That thought encouraged them to a last effort. They pushed their flagging limbs up, upward through an inferno of heated air. Suddenly Dodd uttered a yell and pointed upward.

"God!" ejaculated Tommy. Then he seized Dodd in his arms and nearly crushed him. For high above them, a pin-point in the black void, they saw—a star!

They were almost at the earth's surface!

One more effort, and suddenly the ground seemed to give beneath them. They breathed the outer air, and went sliding down a chute of sand, and stopped, half buried, at the bottom.

Chapter 8: Recaptured

"Where are we?" each demanded of the other, as they staggered out.

It was a moonless night, and the air was chill, but they were certainly nowhere near the polar regions, for there was no trace of snow to be seen anywhere. All about them was sand, with here and there a spiny shrub standing up stiff and erect and solitary.

When they had disengaged themselves from the clinging sand they could see that they were apparently in the hollow of a vast crater, that must have been half a mile in circumference. It was low and worn down to an elevation of not more than two or three hundred feet, and evidently the volcano that had thrown it up had been extinct for millennia.

"Water!" gasped Dodd.

They looked all about them. They could see no signs of a spring anywhere, and both were parched with thirst after their terrific climb.

"We must find water, Haidia," said Tommy. "Why, what's the matter?"

Haidia was pointing upward at the starry heaven, and shivering with fear. "Eyes!" she cried. "Big beetles waiting for us up there!"

"No, no, Haidia," Dodd explained. "Those are stars. They are worlds—places where people live."

"Will you take me up there?" asked Haidia.

"No, this is our world," said Dodd. "And by and by the sun will rise, that's a big ball of fire up there. He watches over the world and gives us light and warmth. Don't be afraid. I'll take care of you."

"Haidia is not afraid with Jimmydodd to take care of her," replied the girl with dignity. "Haidia smells water—over there." She pointed across one side of the crater.

"There we'd better hurry," said Tommy, "because I can't hold out much longer."

The three scrambled over the soft sand, which sucked in their feet to the ankle at every step. It was with the greatest difficulty that they succeeded in reaching the crater's summit, low though it was. Then Dodd uttered a cry, and pointed. In front of them extended a long pool of water, with a scrubby growth around the edges.

The ground was firmer here, and they hurried toward it. Tommy was the first to reach it. He lay down on his face and drank eagerly. He had taken in a quart before he discovered that the water was saline.

At the same time Dodd uttered an exclamation of disgust. Haidia, too, after sipping a little of the fluid, had stood up, chattering excitedly in her own language.

But she was not chattering about the water. She was pointing toward the scrub. "Men there!" she cried. "Men like you and Tommy, Jimmydodd."

Tommy and Dodd looked at each other, the water already forgotten in their excitement at Haidia's

information, which neither of them doubted.

Brave as she was, the girl now hung back behind Dodd, letting the two men take precedence of her. The water, saline as it was, had partly quenched their thirst. They felt their strength reviving.

And it was growing light. In the east the sky was already flecked with yellow pink. They felt a thrill of intense excitement at the prospect of meeting others of their kind.

"Where do you think we are?" asked Tommy.

Dodd stopped to look at a shrub that was growing near the edge of the pool. "I don't think, I know, Tommy," he answered. "This is wattle."

"Yes?"

"We're somewhere in the interior regions of the Australian continent—and that's not going to help us much."

"Over there—over there," panted Haidia. "Hold me, Jimmydodd. I can't see. Ah, this terrible light!"

She screwed her eyelids tightly together to shut out the pale light of dawn. The men had already discovered that the third membrane had been burned away.

"We must get her out of here," whispered Dodd to Tommy. "Somewhere where it's dark, before the sun rises. Let's go back to the entrance of the crater."

But Haidia, her arm extended, persisted, "Over there! Over there!"

Suddenly a spear came whirling out of a growth of wattle beside the pool. It whizzed past Tommy's face and dropped into the sand behind. Between the trunks of the wattles they could see the forms of a party of blackfellows, watching them intently.

Tommy held up his arms and moved forward with a show of confidence that he was far from feeling. After what he had escaped in the underworld he was in no

mood to be massacred now.

But the blacks were evidently not hostile. It was probable that the spear had not been aimed to kill. At the sight of the two white men, and the white woman, they came forward doubtfully, then more fearlessly, shouting in their language. In another minute Tommy and Dodd were the center of a group of wondering savages.

Especially Haidia. Three or four gins, or black women, had crept out of the scrub, and were already examining her with guttural cries, and fingering the hair garment that she wore.

"Water!" said Tommy, pointing to his throat, and then to the pool, with a frown of disgust.

The blackfellows grinned, and led the three a short distance to a place where a large hollow had been scooped in the sandy floor of the desert. It was full of water, perfectly sweet to the taste. The three drank gratefully.

Suddenly the edge of the sun appeared above the horizon, gilding the sand with gold. The sunlight fell upon the three, and Haidia uttered a terrible cry of distress. She dropped upon the sand, her hands pressed to her eyes convulsively. Tommy and Dodd dragged her into the thickest part of the scrub, where she lay moaning.

They contrived bandages from the remnants of their clothing, and these, damped with cold water, and bound over the girl's eyes, alleviated her suffering somewhat. Meanwhile the blackfellows had prepared a meal of roast opossum. After their long diet of shrimps, it tasted like ambrosia to the two men.

Much to their surprise, Haidia seemed to enjoy it too. The three squatted in the scrub among the friendly blacks, discussing their situation.

"These fellows will save us," said Dodd. "It may be that we're quite near the coast, but, any way, they'll stick to us, even if only out of curiosity. They'll take us somewhere. But as soon as we get Haidia to safety we'll have to go back along our trail. We mustn't lose

our direction. Suppose I was laughed at when I get back, called a liar! I tell you, we've got to have something to show, to prove my statements, before I can persuade anybody to fit out an expedition into Submundia. Even those three beetle-shells that we dropped in the crater won't be conclusive evidence for the type of mind that sits in the chairs of science to-day. And, speaking of that, we must get those blacks to carry those shells for us. I tell you, nobody will believe—"

"What's that?" cried Tommy sharply, as a rasping sound rose above the cries of the frightened blacks.

But there was no need to ask. Out of the crater two enormous beetles were winging their way toward them, two beetles larger than any that they had seen.

Fully seven feet in length, they were circling about each other, apparently engaged in a vicious battle.

The fearful beaks stabbed at the flesh beneath the shells, and they alternately stabbed and drew back, all the while approaching the party, which watched

them, petrified with terror.

It was evident that the monsters had no conception of the presence of humans. Blinded by the sun, only one thing could have induced them to leave the dark depths of Submundia. That was the mating instinct. The beetles were evidently rival leaders of some swarm, engaged in a duel to the death.

Round and round they went in a dizzy maze, stabbing and thrusting, jaws closing on flesh, until they dropped, close-locked in battle, not more than twenty feet from the little party of blacks and whites, both squirming in the agonies of death.

"I don't think that necessarily means that the swarm is on our trail," said Tommy, a little later, as the three stood beside the shells that they had discarded.

"Those two were strays, lost from the swarm and maddened by the mating instinct. Still, it might be as well to wear these things for a while, in case they do follow us."

"You're right," answered Dodd, as he placed one of

the shells around Haidia. "We've got to get this little lady to civilization, and we've got to protect our lives in order to give this great new knowledge to the world. If we are attacked, you must sacrifice your life for me, Tommy, so that I can carry back the news."

"Righto!" answered Tommy with alacrity. "You bet I will, Jim."

The glaring sun of mid-afternoon was shining down upon the desert, but Haidia was no longer in pain. It was evident that she was fast becoming accustomed to the sunlight, though she still kept her eyes screwed up tightly, and had to be helped along by Dodd and Jimmy. In high good humor the three reached the encampment, to find that the blacks were feasting on the dead beetles, while the two eldest members of the party had proudly donned the shells.

It was near sunset before they finally started. Dodd and Tommy had managed to make it clear to them that they wished to reach civilization, but how near this was there was, of course, no means of determining. They noted, however, that the party

started in a southerly direction.

"I should say," said Dodd, "that we are in South Australia, probably three or four hundred miles from the coast. We've got a long journey before us, but these blackfellows will know how to procure food for us."

They certainly knew how to get water, for, just as it began to grow dark, when the three were already tormented by thirst, they stopped at what seemed a mere hollow among the stones and boulders that strewn the face of the desert, and scooped away the sand, leaving a hole which quickly filled with clear, cold water of excellent taste.

After which they made signs that they were to camp there for the night. The moon was riding high in the sky. As it grew dark, Haidia opened her eyes, saw the luminary, and uttered an exclamation, this time not of fear, but of wonder.

"Moon," said Dodd. "That's all right, girl. She watches over the night, as the sun does over the day."

"Haidia likes the moon better than the sun," said the girl wistfully. "But the moon not strong enough to keep away the beetles."

"If I was you, I'd forget about the beetles, Haidia," said Dodd. "They won't come out of that hole in the ground. You'll never see them again."

And, as he spoke, they heard a familiar rasping sound far in the distance.

"How the wind blows," said Tommy, desperately resolved not to believe his ears. "I think a storm's coming up."

But Haidia, with a scream of fear, was clinging to Dodd, and the blacks were on their feet, spears and boomerangs in their hands, looking northward.

Out of that north a little black cloud was gathering. A cloud that spread gradually, as a thunder-cloud, until it covered a good part of the sky. And still more of the sky, and still more. All the while that faint, distant rasping was audible, but it did not increase in volume.

It was as if the beetles had halted until the full number of the swarm had come up out of the crater.

Then the cloud, which by now covered half the sky, began to take geometric form. It grew square, the ragged edges seemed to trim themselves away, streaks of light shot through it at right angles, as if it was marshaling itself into companies.

The doomed men and the girl stood perfectly still, staring at that phenomenon. They knew that only a miracle could save them. They did not even speak, but Haidia clung more tightly to Dodd's arm.

Then suddenly the cloud spread upward and covered the face of the moon.

"Well, this is good-by, Tommy," said Dodd, gripping his friend's hand. "God, I wish I had a revolver, or a knife!" He looked at Haidia.

Suddenly the rasping became a whining shriek. A score of enormous beetles, the advance guards of the army, zoomed out of the darkness into a ray of

straggling moonlight. Shrieking, the blacks, who had watched the approaching swarm perfectly immobile, threw away the two shells and bolted.

"Good Lord," Dodd shouted, "did you see the color of their shells, Tommy?" Even in that moment the scientific observer came uppermost in him. "Those red edges? They must be young ones, Tommy. It's the new brood! No wonder Bram stayed behind! He was waiting for them to hatch! The new brood! We're doomed—doomed! All my work wasted!"

The blackfellows did not get very far. A hundred yards from the place where they started to run they dropped, their bodies hidden beneath the clustering monsters, their screams cut short as those frightful beaks sought their throats, and those jaws crunched through flesh and bone.

Circling around Dodd, Tommy, and Haidia, as if puzzled by their appearance, the beetles kept up a continuous, furious droning that sounded like the roar of Niagara mixed with the shrieking of a thousand sirens. The moon was completely hidden, and only a

dim, nebulous light showed the repulsive monsters as they flew within a few feet of the heads of the fugitives. The stench was overpowering.

But suddenly a ray of white light shot through the darkness, and, with a changed note, just perceptible to the ears of the two men, but doubtless of the greatest significance to the beetles, the swarm fled apart to right and left, leaving a clear lane, through which appeared—Bram, reclining on his shell-couch above his eight trained beetle steeds!

Hovering overhead, the eight huge monsters dropped lightly to the ground beside the three. Bram sat up, a vicious grin upon his twisted face. In his hand he held a large electric bulb, its sides sheathed in a roughly carved wooden frame; the wire was attached to a battery behind him.

"Well met, my friends!" he shouted exultantly. "I owe you more thanks than I can express for having so providentially left the electrical equipment of your plane undamaged after you crashed at the entrance to Submundia. I had a hunch about it—and the hunch

worked!"

He grinned more malevolently as he looked from one man to the other.

"You've run your race," he said. "But I'm going to have a little fun with you before you die. I'm going to use you as an object lesson. You'll find it out in a little while."

"Go ahead, go ahead, Bram," Dodd grinned back at him. "Just a few million years ago, and you were a speck of protoplasm—in that pre-pleistocene age—swimming among the invertebrate crustaceans that characterized that epoch."

"Invertebrates and monotremes, Dodd," said Bram, almost wistfully. "The mammals were already existent on the earth, as you know—" Suddenly he broke off, as he realized that Dodd was spoofing him. A yell of execration broke from his lips. He uttered a high whistle, and instantly the whiplike lashes of a hundred beetles whizzed through the darkness and remained poised over Dodd's head.

"Not even the marsupial lion, Bram," grinned Dodd, undismayed. "Go ahead, go ahead, but I'll not die with a lie upon my lips!"

Chapter 9: The Trail of Death

"There's sure some sort of hoodoo on these Antarctic expeditions, Wilson," said the city editor of *The Daily Record* to the star rewrite man. He glanced through the hastily typed report that had come through on the wireless set erected on the thirty-sixth story of the Record Building. "Tommy Travers gone, eh? And James Dodd, too! There'll be woe and wailing along the Great White Way to-night when this news gets out. They say that half the chorus girls in town considered themselves engaged to Tommy. Nice fellow, too! Always did like him!"

"Queer, that curtain of fog that seems to lie on the actual site of the south pole," he continued, glancing over the report again. "So Storm thinks that Tommy crashed in it, and that it's a million to one against their ever finding his remains. What's this about beetles? Shells of enormous prehistoric beetles found

by Tommy and Dodd! That'll make good copy, Wilson. Let's play that up. Hand it to Jones, and tell him to scare up a catching headline or two."

He beckoned to the boy who was hurrying toward his desk, a flimsy in his hand, glanced through it, and tossed it toward Wilson.

"What do they think this is, April Fool's Day?" he asked. "I'm surprised that the International Press should fall for such stuff as that!"

"Why, to-morrow is the first of April!" exclaimed Wilson, tossing back the cable dispatch with a contemptuous laugh.

"Well, it won't do the I. P. much good to play those tricks on their subscribers," said the city editor testily. "I'm surprised, to say the least. I guess their Adelaide correspondent has gone off his head or something. Using poor Travers's name, too! Of course that fellow didn't know he was dead, but still...."

That was how *The Daily Record* missed being the first

to give out certain information that was to stagger the world. The dispatch, which had evidently outrun an earlier one, was as follows:

ADELAIDE, South Australia, March 31.—
Further telegraphic communications arriving almost continuously from Settler's Station, signed by Thomas Travers, member of Travers Antarctic Expedition, who claims to have penetrated earth's interior at south pole and to have come out near Victoria Desert. Travers states that swarm of prehistoric beetles, estimated at two trillion, and as large as men, with shells impenetrable by rifle bullets, now besieging Settler's Station, where he and Dodd and Haidia, woman of subterranean race whom they brought away, are shut up in telegraph office. Bram, former member of Greystoke Expedition, said to be in charge of swarm, with intention of obliterating human race. Every living thing at Settler's Station destroyed, and swarm moving south.

It was a small-town paper a hundred miles from New

York that took a chance on publishing this report from the International Press, in spite of frantic efforts on the parts of the head office to recall it after it had been transmitted. This paper published the account as an April Fool's Day joke, though later it took to itself the credit for having believed it. But by the time April Fool's Day dawned all the world knew that the account was, if anything, an under-estimate of the fearful things that were happening "down under."

It was known now that the swarm of monsters had originated in the Great Victoria Desert, one of the worst stretches of desolation in the world, situated in the south-east corner of Western Australia. Their numbers were incalculable. Wimbush, the aviator, who was attempting to cross the continent from east to west, reported afterward that he had flown for four days, skirting the edge of the swarm, and that the whole of that time they were moving in the same direction, a thick cloud that left a trail of dense darkness on earth beneath them, like the path of an eclipse. Wimbush escaped them only because he had a ceiling of twenty thousand feet, to which apparently

the beetles could not soar.

And this swarm was only about one-fourth of the whole number of the monsters. This was the swarm that was moving westward, and subsequently totally destroyed all living things in Kalgoorlie, Coolgardie, Perth, and all the coastal cities of Western Australia.

Ships were found drifting in the Indian Ocean, totally destitute of crews and passengers; not even their skeletons were found, and it was estimated that the voracious monsters had carried them away bodily, devoured them in the air, and dropped the remains into the water.

All the world knows now how the sea elephant herd on Kerguelen Island was totally destroyed, and of the giant shells that were found lying everywhere on the deserted beaches, in positions that showed the monsters had in the end devoured one another.

Mauritius was the most westerly point reached by a fraction of the swarm. A little over twenty thousand of the beetles reached that lovely island, by count of the

shells afterward, and all the world knows now of the desperate and successful fight that the inhabitants waged against them. Men and women, boys and girls, blacks and whites, finding that the devils were invulnerable against rifle fire, sallied forth boldly with knives and choppers, and laid down a life for a life.

On the second day after their appearance, the main swarm, a trillion and a half strong, reached the line of the transcontinental railway, and moved eastward into South Australia, traveling, it was estimated, at the rate of two hundred miles an hour. By the next morning they were in Adelaide, a city of nearly a quarter of a million people. By nightfall every living thing in Adelaide and the suburbs had been eaten, except for a few who succeeded in hiding in walled-up cellars, or in the surrounding marshes.

That night the swarm was on the borders of New South Wales and Victoria, and moving in two divisions toward Melbourne and Sydney.

The northern half, it was quickly seen, was flying "wild," with no particular objective, moving in a solid

cohort two hundred miles in length, and devouring game, stock, and humans indiscriminately. It was the southern division, numbering perhaps a trillion, that was under command of Bram, and aimed at destroying Melbourne as Adelaide had been destroyed.

Bram, with his eight beetle steeds, was by this time known and execrated throughout the world. He was pictured as Anti-Christ, and the fulfilment of the prophecies of the Book of Revelations.

And all this while—or, rather, until the telegraph wires were cut—broken, it was discovered later, by perching beetles—Thomas Travers was sending out messages from his post at Settler's Station.

Soon it was known that prodigious creatures were following in the wake of the devastating horde. Mantises, fifteen feet in height, winged things like pterodactyls, longer than bombing airplanes, followed, preying on the stragglers. But the main bodies never halted, and the inroads that the destroyers made on their numbers were insignificant.

Before the swarm reached Adelaide the Commonwealth Government had taken action. Troops had been called out, and all the available airplanes in the country had been ordered to assemble at Broken Hill, New South Wales, a strategic point commanding the approaches to Sydney and Melbourne. Something like four hundred airplanes were assembled, with several batteries of anti-aircraft guns that had been used in the Great War. Every amateur aviator in Australia was on the spot, with machines ranging from tiny Moths to Handley-Pages—anything that could fly.

Nocturnal though the beetles had been, they no longer feared the light of the sun. In fact, it was ascertained later that they were blind. An opacity had formed over the crystalline lens of the eye. Blind, they were no less formidable than with their sight. They existed only to devour, and their numbers made them irresistible, no matter which way they turned.

As soon as the vanguard of the dark cloud was sighted from Broken Hill, the airplanes went aloft. Four hundred planes, each armed with machine guns,

dashed into the serried hosts, drumming out volleys of lead. In a long line, extending nearly to the limits of the beetle formation, thus giving each aviator all the room he needed, the planes gave battle.

The first terror that fell upon the airmen was the discovery that, even at close range, the machine gun bullets failed to penetrate the shells. The force of the impact whirled the beetles around, drove them together in bunches, sent them groping with weaving tentacles through the air—but that was all. On the main body of the invaders no impression was made whatever.

The second terror was the realization that the swarm, driven down here and there from an altitude of several hundred feet, merely resumed their progress on the ground, in a succession of gigantic leaps. Within a few minutes, instead of presenting an inflexible barrier, the line of airplanes was badly broken, each plane surrounded by swarms of the monsters.

Then Bram was seen. And that was the third terror,

the sight of the famous beetle steeds, four pairs abreast, with Bram reclining like a Roman emperor upon the surface of the shells. It is true, Bram had no inclination to risk his own life in battle. At the first sight of the aviators he dodged into the thick of the swarm, where no bullet could reach him. Bram managed to transmit an order, and the beetles drew together.

Some thought afterward that it was by thought transference he effected this maneuver, for instantly the beetles, which had hitherto flown in loose order, became a solid wall, a thousand feet in height, closing in on the planes. The propellers struck them and snapped short, and as the planes went weaving down, the hideous monsters leaped into the cockpits and began their abominable meal.

[Image description start: A black and white illustration of a scene from the short novel, *The Beetle Hoard*, by Victor Rousseau, portraying a scene where an old-fashioned, single-pilot airplane is attacked by a swarm of giant, spotted beetles. Image description end.]

Not a single plane came back. Planes and skeletons, and here and there a shell of a dead beetle, itself completely devoured, were all that was found afterward.

The gunners stayed at their posts till the last moment, firing round after round of shell and shrapnel, with insignificant results. Their skeletons were found not twenty paces from their guns—where the Gunners'

Monument now stands.

Half an hour after the flight had first been sighted the news was being radioed to Sydney, Melbourne, and all other Australian cities, advising instant flight to sea as the only chance of safety. That radio message was cut short—and men listened and shuddered. After that came the crowding aboard all craft in the harbors, the tragedies of the *Eustis*, the *All Australia*, the *Sepphoris*, sunk at their moorings. The innumerable sea tragedies. The horde of fugitives that landed in New Zealand. The reign of terror when the mob got out of hand, the burning of Melbourne, the sack of Sydney.

And south and eastward, like a resistless flood, the beetle swarm came pouring. Well had Bram boasted that he would make the earth a desert!

A hundred miles of poisoned carcasses of sheep, extended outside Sydney's suburbs, gave the first promise of success. Long mounds of beetle shells testified to the results; moreover, the beetles that fed on the carcasses of their fellows, were in turn

poisoned and died. But this was only a drop in the bucket. What counted was that the swift advance was slowing down. As if exhausted by their efforts, or else satiated with food, the beetles were doing what the soldiers did.

They were digging in!

Twenty-four miles from Sydney, eighteen outside Melbourne, the advance was stayed.

Volunteers who went out from those cities reported that the beetles seemed to be resting in long trenches that they had excavated, so that only their shells appeared above ground. Trees were covered with clinging beetles, every wall, every house was invisible beneath the beetle armor.

Australia had a respite. Perhaps only for a night or day, but still time to draw breath, time to consider, time for the shiploads of fugitives to get farther from the continent that had become a shambles.

And then the cry went up, not only from Australia, but

from all the world, "Get Travers!"

Chapter 10: At Bay

Bram put his fingers to his mouth and whistled, a shrill whistle, yet audible to Dodd, Tommy, and Haidia. Instantly three pairs of beetles appeared out of the throng. Their tentacles went out, and the two men and the girl found themselves hoisted separately upon the backs of the pairs. Next moment they were flying side by side, high in the air above the surrounding swarm.

They could see one another, but it was impossible for them to make their voices heard above the rasping of the beetles' legs. Hours went by, while the moon crossed the sky and dipped toward the horizon. Tommy knew that the moon would set about the hour of dawn. And the stars were already beginning to pale when he saw a line of telegraph poles, then two lines of shining metals, then a small settlement of stone and brick houses.

Tommy was not familiar with the geography of

Australia, but he knew this must be the transcontinental line.

Whirling onward, the cloud of beetles suddenly swooped downward. For a moment Tommy could see the frightened occupants of the settlement crowding into the single street, then he shuddered with sick horror as he saw them obliterated by the swarm.

There was no struggle, no attempt at flight or resistance. One moment those forty-odd men were there—the next minute they existed no longer. There was nothing but a swarm of beetles, walking about like men with shells upon their backs.

And now Tommy saw evidences of Bram's devilish control of the swarm. For out of the cloud dropped what seemed to be a phalanx of beetle guards, the military police of beetledom, and, lashing fiercely with their tentacles, they drove back all the swarm that sought to join their companions in their ghoulish feast. There was just so much food and no more; the rest must seek theirs further.

But even beetles, it may be presumed, are not entirely under discipline at all times. The pair of beetles that bore Tommy, suddenly swooped apart, ten or a dozen feet from the ground, and dashed into the thick of the struggling, frenzied mass, flinging their rider to earth.

Tommy struck the soft sand, sat up, half dazed, saw his shell lying a few feet away from him, and retrieved it just as a couple of the monsters came swooping down at him.

He looked about him. Not far away stood Dodd and Haidia, with their shells on their backs. They recognized Tommy and ran toward him.

Not more than twenty yards away stood the railroad station, with several crates of goods on the platform. Next to it was a substantial house of stone, with the front door open.

Tommy pointed to it, and Dodd understood and shouted something that was lost in the furious buzz of the beetles' wings as they devoured their prey. The three raced for the entrance, gained it unmolested,

and closed the door.

There was a key in the door, and it was light enough for them to see a chain, which Dodd pulled into position. There was only one story, and there were three rooms, apparently, with the kitchen. Tommy rushed to the kitchen door, locked it, too, and, with almost super-human efforts, dragged the large iron stove against it. He rushed to the window, but it was a mere loophole, not large enough to admit a child. Nevertheless, he stood the heavy table on end so that it covered it. Then he ran back.

Dodd had already barricaded the window of the larger room, which was a bed-sitting room, with a heavy wardrobe, and the wooden bedstead, jamming the two pieces sidewise against the wall, so that they could not be forced apart without being demolished. He was now busy in the smaller room, which seemed to be the station-master's office, dragging an iron safe across the floor. But the window was criss-crossed with iron bars, and it was evident that the safe, which was locked, contained at times considerable money, for the window could hardly have been forced save by

a charge of nitro-glycerine or dynamite. However, it was against the door that Dodd placed the safe, and he stood back, panting.

"Good," said Haidia. "That will hold them."

The two men looked at her doubtfully. Did Haidia know what she was talking about?

The sun had risen. A long shaft shot into the room. Outside the beetles were still buzzing as they turned over the vestiges of their prey. There were as yet no signs of attack. Suddenly Tommy grasped Dodd's arm.

"Look!" he shouted, pointing to a corner which had been in gloom a moment before.

There was a table there, and on it a telegraphic instrument. Telegraphy had been one of Tommy's hobbies in boyhood. In a moment he was busy at the table.

Dot-dash-dot-dash! Then suddenly outside a furious hum, and the impact of beetle bodies against the front

door.

Tommy got up, grinning. That was the first, interrupted message from Tommy that was received.

Through the barred window the three could see the furious efforts of the beetles to force an entrance. But the very tensile strength of the beetle-shells, which rendered them impervious to bullets, required a laminate construction which rendered them powerless against brick or stone.

Desperately the swarm dashed itself against the walls, until the ground outside was piled high with stunned beetles. Not the faintest impression was made on the defenses.

"Watch them, Jim," said Tom. "I'll go see if the rear's secure."

That thought of his seemed to have been anticipated by the beetles, for as Tommy reached the kitchen the swarm came dashing against door and window, always recoiling. Tommy came back, grinning all over

his face.

"You were right, Haidia," he said. "We've held them all right, and the tables are turned on Bram. Also I got a message through, I think," he added to Dodd.

Dash—dot—dash—dot from the instrument. Tommy ran to the table again. Dash—dot went back. For five minutes Tommy labored, while the beetles hammered now on one door, now on another, now on the windows. Then Tommy got up.

"It was some station down the line," he said. "I've told them, and they're sending a man up here to replace the telegraphist, also a couple of cops. They think I'm crazy. I told them again. That's the best I could do."

"Dodd! Travers! For the last time—let's talk!"

The cloud of beetles seemed to have thinned, for the sun was shining into the room. Bram's voice was perfectly audible, though he himself was invisible; probably he thought it likely that the defenders had obtained firearms.

"Nothing to say to you, Bram," called Dodd. "We've finished our discussion on the monotremes."

"I want you fellows to stand in with me," came Bram's plaintive tones. "It's so lonesome all by one's self, Dodd."

"Ah, you're beginning to find that out, are you?" Dodd could not resist answering. "You'll be lonelier yet before you're through."

"Dodd, I didn't bring that swarm up here. I swear it. I've been trying to control them from the beginning. I saw what was coming. I believe I can avert this horror, drive them into the sea or something like that. Don't make me desperate, Dodd.

"And listen, old man. About those monotremes—sensible men don't quarrel over things like that. Why can't we agree to differ?"

"Ah, now you're talking, Bram," Dodd answered. "Only you're too late. After what's happened here to-day, we'll have no truck with you. That's final."

"Damn you," shrieked Bram. "I'll batter down this house. I'll—"

"You'll do nothing, Bram, because you can't," Dodd answered. "Travers has wired full information about your devil-horde, and likewise about you, and all Australia will be prepared to give you a warm reception when you arrive."

"I tell you I'm invincible," Bram screamed. "In three days Australia will be a ruin, a depopulated desert. In a week, all southern Asia, in three weeks Europe, in two months America."

"You've been taking too many of those pellets, Bram," Dodd answered. "Stand back now! Stand back, wherever you are, or I'll open the door and throw the slops over you."

Bram's screech rose high above the droning of the wings. In another moment the interior of the room had grown as black as night. The rattle of the beetle shells against the four walls of the house was like the clattering of stage thunder.

All through the darkness Dodd could hear the unhurried clicking of the key.

At last the rattling ceased. The sun shone in again. The ground all around the house was packed with fallen beetles, six feet high, a writhing mass that creaked and clattered as it strove to disengage itself.

Bram's voice once more: "I'm leaving a guard, Dodd. They'll get you if you try to leave. But they won't eat you. I'm going to have you three sliced into little pieces, the Thousand Deaths of the Chinese. The beetles will eat the parts that are sliced away—and you'll live to watch them. I'll be back with a stick or two of dynamite to-morrow."

"Yeah, but listen, Bram," Dodd sang out. "Listen, you old marsupial tiger. When those pipe dreams clear away, I'm going to build a gallows of beetle-shells reaching to the moon, to hang you on!"

Bram's screech of madness died away. The strident rasping of the beetles' legs began again. For hours the three heard it; it was not until nightfall that it

died away.

Bram had made good his threat, for all around the house, extending as far as they could see, was the host of beetle-guards. To venture out, even with their shells about them, was clearly a hazardous undertaking. There was neither food nor water in the place.

"We'll just have to hold out," said Dodd, breaking one of the long periods of silence.

Tommy did not answer; he did not hear him, for he was busy at the key. Suddenly he leaped to his feet.

"God, Jimmy," he cried, "that devil's making good his threat! The swarm's in South Australia, destroying every living thing, wiping out whole towns and villages! And they—they believe me now!"

He sank into a chair. For the first time the strain of the awful past seemed to grip him. Haidia came to his side.

"The beetles are finish," she said in her soft voice.

"How d'you know, Haidia?" demanded Dodd.

"The beetles are finish," Haidia repeated quietly, and that was all that Dodd could get out of her. But again the key began to click, and Tommy staggered to the table. Dot—dash—dash—dot. Presently he looked up once more.

"The swarm's halfway to Adelaide," he said. "They want to know if I can help them. Help them!" He burst into hysterical laughter.

Toward evening he came back after an hour at the key. "Line must be broken," he said. "I'm getting nothing."

In the moonlight they could see the huge compound eyes of the beetle guards glittering like enormous diamonds outside. They had not been conscious of thirst during the day, but now, with the coming of the cool night their desire for water became paramount.

"Tommy, there must be water in the station," said Dodd. "I'm going to get a pitcher from the kitchen and risk it, Tommy. Take care of Haidia if—" he added.

But Haidia laid her hand upon his arm. "Do not go, Jimmydodd," she said. "We can be thirsty to-night, and to-morrow the beetles will be finish."

"How d'you know?" asked Dodd again. But now he realized that Haidia had never learned the significance of an interrogation. She only repeated her statement, and again the two men had to remain content.

The long night passed. Outside the many facets of the beetle eyes. Inside the two men, desperate with anxiety, not for themselves, but for the fate of the world, snatching a few moments' sleep from time to time, then looking up to see those glaring eyes from the silent watchers.

Then dawn came stealing over the desert, and the two shook themselves free from sleep. And now the eyes were gone.

But there was immense activity among the beetles. They were scurrying to and fro, and, as they watched, Dodd and Tommy began to see some significance in their movements.

"Why, they're digging trenches!" Tommy shouted. "That's horrible, Jimmy! Are they intending to conduct sapping operations against us like engineers, or what?"

Dodd did not reply, and Tommy hardly expected any answer. As the two men, now joined by Haidia, watched, they saw that the beetles were actually digging themselves into the sand.

Within the space of an hour, by the time the first shafts of sunlight began to stream into the room, there was to be seen only the massive, rounded shells of the monsters as they squatted in the sand.

"Now you may fetch water," said Haidia, smiling at her lover. "No, you do not need the shells," she added. "The beetles are finish. It is as the wise men of my people told me."

Wondering, hesitating, Tommy and Dodd unlocked the front door. They stood upon the threshold ready to bolt back again. But there was no stirring among the beetle hosts.

Growing bolder, they advanced a few steps; then, shamed by Haidia's courage, they followed her, still cautiously to the station.

Dodd shouted as he saw a water-tank, and a receptacle above it with a water-cock. They let Haidia drink, then followed suit, and for a few moments, as they appeased their thirst, the beetles were forgotten.

Then they turned back. There had been no movement in that line of shells that glinted in the morning sunlight.

"Come, I shall show you," said Haidia confidently, advancing toward the trench.

Dodd would have stopped her, but the girl moved forward quickly, eluded him with a graceful, mirthful gesture, and stooped down over the trench.

She rose up, raising in her arms an empty beetle-shell!

Dodd, who had reached the trench before Tommy, turned round and yelled to him excitedly. Tommy ran forward—and then he understood.

The shells were empty. The swarm, whose life cycle Bram had admitted he did not understand, had just moulted!

It had moulted because the bodies, gorged with food, had grown too large for the shells. In time, if left alone, the monsters would grow larger shells, become invincible again. But just now they were defenseless as new-born babes—and knew it.

Deep underneath the empty shells they had burrowed into the ground. Everywhere at the bottom of the deep trenches were the naked, bestial creatures, waving helpless tentacles and squirming over one another as they strove to find shelter and security.

A sudden madness came over Tommy and Dodd.

"Dynamite—there must be dynamite!" Dodd shouted, as he ran back to the station.

"Something better than dynamite," shouted Tommy, holding up one of a score of drums of petrol!

Chapter 11: The World Set Free

They waited two days at Settler's Station. To push along the line into the desert would have been useless, and both men were convinced that an airplane would arrive for them. But it was not until the second afternoon that the aviator arrived, half-dead with thirst and fatigue, and almost incoherent.

His was the last plane on the Australian continent. He brought the news of the destruction of Adelaide, and of the siege of Melbourne and Sydney, as he termed it. He told Dodd and Tommy that the two cities had been surrounded with trenches and barbed wire. Machine guns and artillery were bombarding the trenches in which the beetles had taken shelter.

"Has any one been out on reconnaissance?" asked

Tommy.

Nobody had been permitted to pass through the barbed wire, though there had been volunteers. It meant certain death. But, unless the beetles were sapping deep in the ground, what their purpose was, nobody knew.

Tommy and Dodd led him to the piles of smoking, stinking débris and told him.

That was where the aviator fainted from sheer relief.

"The Commonwealth wants you to take supreme command against the beetles," he told Tommy, when he had recovered. "I'm to bring you back. Not that they expect me back. But—God, what a piece of news! Forgive my swearing—I used to be a parson. Still am, for the matter of that."

"How are you going to bring us three back in your plane?" asked Tommy.

"I shall stay here with Jimmydodd," said Haidia

suavely. "There is not the least danger any more. You must destroy the beetles before their shells have grown again, that's all."

"Used to be a parson, you say? Still are?" shouted Dodd excitedly. "Thank God! I mean, I'm glad to hear it. Come inside, and come quick. I want you too, Tommy!"

Then Tommy understood. And it seemed as if Haidia understood, by some instinct that belongs exclusively to women, for her cheeks were flushed as she turned and smiled into Dodd's eyes.

Ten minutes later Tommy hopped into the biplane, leaving the happy married couple at Settler's Station. His eyes grew misty as the plane took the air, and he saw them waving to him from the ground. Dodd and Haidia and he had been through so many adventures, and had reached safety. He must not fail.

He did not fail. He found himself at Sydney in command of thirty thousand men, all enthusiastic for the fight for the human race, soldiers and volunteers

ready to fight until they dropped. When the news of the situation was made public, an immense wave of hope ran through the world.

National differences were forgotten, color and creed and race grew more tolerant of one another. A new day had dawned—the day of humanity's true liberation.

Tommy's first act was to call out the fire companies and have the beetles' trenches saturated with petrol from the fire hoses. Then incendiary bullets, shot from guns from a safe distance, quickly converted them into blazing infernos.

But even so only a tithe of the beetle army had been destroyed. Two hundred planes had already been rushed from New Zealand, and their aviators went up and scoured the country far and wide. Everywhere they found trenches, and, where the soil was stony, millions of the beetles clustered helplessly beneath great mounds of discarded shells.

An army of black trackers had been brought in planes

from all parts of the country, and they searched out the beetle masses everywhere along the course that the invaders had taken. Then incendiary bombs were dropped from above.

Day after day the beetle massacre went on. By the end of a week the survivors of the invasion began to take heart again. It was certain that the greater portion of the horde had been destroyed.

There was only one thing lacking. No trace of Bram had been seen since his appearance at the head of his beetle army in front of Broken Hill. And louder and more insistent grew the world clamor that he should be found, and put to death in some way more horrible than any yet devised.

The ingenuity of a million minds worked upon this problem. Newspapers all over the world offered prizes for the most suitable form of death. Ingenious Oriental tortures were rediscovered.

The only thing lacking was Bram.

A spy craze ran through Australia. Five hundred Brams were found, and all of them were in imminent danger of death before they were able to prove an alias.

And, oddly enough, it was Tommy and Dodd who found Bram. For Dodd had been brought back east, together with his bride, and given an important command in the Army of Extermination.

Dodd had joined Tommy not far from Broken Hill, where a swarm of a hundred thousand beetles had been found in a little known valley. The monsters had begun to grow new shells, and the news had excited a fresh wave of apprehension. The airplanes had concentrated for an attack upon them, and Tommy and Dodd were riding together, Tommy at the controls, and Dodd observing.

Dodd called through the tube to Tommy, and indicated a mass that was moving through the scrub—some fifty thousand beetles, executing short hops and evidently regaining some vitality. Tommy nodded.

He signalled, and the fleet of planes circled around and began to drop their incendiary bombs. Within a few minutes the beetles were ringed with a wall of fire. Presently the whole terrain was a blazing furnace.

Hours later, when the fires had died away, Tommy and Dodd went down to look at the destruction that had been wrought. The scene was horrible. Great masses of charred flesh and shell were piled up everywhere.

"I guess that's been a pretty thorough job," said Tommy. "Let's get back, Jim."

"What's that?" cried Dodd, pointing. Then, "My God, Tommy, it's one of our men!"

It was a man, but it was not one of their men, that creeping, maimed, half-cinder and half-human thing that was trying to crawl into the hollow of a rock. It was Bram, and recognition was mutual.

Bram dropping, moaning; he was only the shell of a man, and it was incredible how he had managed to

survive that ordeal of fire. The remainder of his life, which only his indomitable will had held in that shattered body, was evidently a matter of minutes, but he looked up at Dodd and laughed.

"So—you're—here, damn you!" he snarled. "And—you think—you've won. I've—another card—another invasion of the world—beside which this is child's play. It's an invasion—"

Bram was going, but he pulled himself together with a supreme effort.

"Invasion by—new species of—monotremes," he croaked. "Deep down in—earth. Was saving to—prove you the liar you are. Monotremes—egg-laying platypus big as an elephant—existent long before pleistocene epoch—make you recant, you lying fool!"

Bram died, an outburst of bitter laughter on his lips. Dodd stood silent for a while; then reverently he removed his hat.

"He was a madman and a devil, but he had the

potentialities of a god, Tommy," he said.

#02 The Cave Of Horror, by Sterner St. Paul Meek:

Screaming, the guardsman was jerked through the air. An unearthly screech rang through the cavern.

The unseen horror of mammoth have had struck
again!

- - -

Dr. Bird looked up impatiently as the door of his private laboratory in the Bureau of Standards swung open, but the frown on his face changed to a smile as he saw the form of Operative Carnes of the United States Secret Service framed in the doorway.

"Hello, Carnes," he called cheerfully. "Take a seat and make yourself at home for a few minutes. I'll be with you as soon as I finish getting this weight."

Carnes sat on the edge of a bench and watched with admiration the long nervous hands and the slim tapering fingers of the famous scientist. Dr. Bird stood well over six feet and weighed two hundred and six pounds stripped: his massive shoulders and heavy shock of unruly black hair combined to give him the appearance of a prize-fighter—until one looked at his hands. Acid stains and scars could not hide the beauty of those mobile hands, the hands of an artist and a dreamer. An artist Dr. Bird was, albeit his artistry expressed itself in the most delicate and complicated experiments in the realms of pure and applied science that the world has ever seen, rather than in the commoner forms of art.

The doctor finished his task of weighing a porcelain crucible, set it carefully into a dessicator, and turned to his friend.

"What's on your mind, Carnes?" he asked. "You look worried. Is there another counterfeit on the market?"

The operative shook his head.

"Have you been reading those stories that the papers have been carrying about Mammoth Cave?" he asked.

Dr. Bird emitted a snort of disgust.

"I read the first one of them part way through on the strength of its being an Associated Press dispatch," he replied, "but that was enough. It didn't exactly impress me with its veracity, and, from a viewpoint of literature, the thing was impossible. I have no time to pore over the lucubrations of an inspired press agent."

"So you dismissed them as mere press agent work?"

"Certainly. What else could they be? Things like that don't happen fortuitously just as the tourist season is about to open. I suppose that those yarns will bring flocks of the curious to Kentucky though: the public always responds well to sea serpent yarns."

"Mammoth Cave has been closed to visitors for the season," said Carnes quietly.

"What?" cried the doctor in surprise. "Was there really something to those wild yarns?"

"There was, and what is more to the point, there still is. At least there is enough to it that I am leaving for Kentucky this evening, and I came here for the express purpose of asking you whether you wanted to come along. Bolton suggested that I ask you: he said that the whole thing sounded to him like magic and that magic was more in your line than in ours. He made out a request for your services and I have it in my pocket now. Are you interested?"

"How does the secret service cut in on it?" asked the doctor. "It seems to me that it is a state matter. Mammoth Cave isn't a National Park."

"Apparently you haven't followed the papers. It *was* a state matter until the Governor asked for federal troops. Whenever the regulars get into trouble, the federal government is rather apt to take a hand."

"I didn't know that regulars had been sent there. Tell me about the case."

"Will you come along?"

Dr. Bird shook his head slowly.

"I really don't see how I can spare the time, Carnes," he said. "I am in the midst of some work of the utmost importance and it hasn't reached the stage where I can turn it over to an assistant."

"Then I won't bother you with the details," replied Carnes as he rose.

"Sit down, confound you!" cried the doctor. "You know better than to try to pull that on me. Tell me your case, and then I'll tell you whether I'll go or not. I can't spare the time, but, on the other hand, if it sounds interesting enough...."

Carnes laughed.

"All right, Doctor," he said, "I'll take enough time to tell you about it even if you can't go. Do you know anything about it?"

"No. I read the first story half way through and then stopped. Start at the beginning and tell me the whole thing."

"Have you ever been to Mammoth Cave?"

"No."

"It, or rather they, for while it is called Mammoth Cave it is really a series of caves, are located in Edmonson County in Central Kentucky, on a spur railroad from Glasgow Junction on the Louisville and Nashville Railroad. They are natural limestone caverns with the customary stalactite and stalagmite formation, but are unusually large and very beautiful. The caves are quite extensive and they are on different levels, so that a guide is necessary if one wants to enter them and be at all sure of finding the way out. Visitors are taken over a regular route and are seldom allowed to visit portions of the cave off these routes. Large parts of the cave have never been thoroughly explored or mapped. So much for the scene.

"About a month ago a party from Philadelphia who were motoring through Kentucky, entered the cave with a regular guide. The party consisted of a man and his wife and their two children, a boy of fourteen and a girl of twelve. They went quite a distance back into the caves and then, as the mother was feeling tired, she and her husband sat down, intending to wait until the guide showed the children some sights which lay just ahead and then return to them. The guide and the children never returned."

"What happened?"

"No one knows. All that is known is the bare fact that they have not been seen since."

"A kidnapping case?"

"Apparently not, in the light of later happenings, although that was at first thought to be the explanation. The parents waited for some time. The mother says that she heard faint screams in the distance some ten minutes after the guide and the children left, but they were very far away and she

isn't sure that she heard them at all. At any rate, they didn't impress her at the time.

"When half an hour had passed they began to feel anxious, and the father took a torch and started out to hunt for them. The usual thing happened; he got lost. When *he* failed to return, the mother, now thoroughly alarmed, made her way, by some uncanny sense of direction, to the entrance and gave the alarm. In half an hour a dozen search parties were on their way into the cave. The father was soon located, not far from the beaten trail, but despite three days of constant search, the children were not located. The only trace of them that was found was a bracelet which the mother identified. It was found in the cavern some distance from the beaten path and was broken, as though by violence. There were no other signs of a struggle.

"When the bracelet was found, the kidnapping theory gained vogue, for John Harrel, the missing guide, knew the cave well and natives of the vicinity scouted the idea that he might be lost. Inspired by the large reward offered by the father, fresh parties began to

explore the unknown portions of the cave. And then came the second tragedy. Two of the searchers failed to return. This time there seemed to be little doubt of violence, for screams and a pistol shot were faintly heard by other searchers, together with a peculiar 'screaming howl,' as it was described by those who heard it. A search was at once made toward the spot where the bracelet had been picked up, and the gun of one of the missing men was found within fifty yards of the spot where the bracelet had been discovered. One cylinder of the revolver had been discharged."

"Were there any signs on the floor?"

"The searchers said that the floor appeared to be rather more moist and slimy than usual, but that was all. They also spoke of a very faint smell of musk, but this observation was not confirmed by others who arrived a few moments later."

"What happened next?"

"The Governor was appealed to and a company of the National Guard was sent from Louisville to Mammoth

Cave. They took up camp at the mouth of the cave and prevented everyone from entering. Soldiers armed with service rifles penetrated the caverns, but found nothing. Visitors were excluded, and the guardsmen established regular patrols and sentry posts in the cave with the result that one night, when time came for a relief, the only trace that could be found of one of the guards was his rifle. It had not been fired. Double guards were then posted, and nothing happened for several days—and then another sentry disappeared. His companion came rushing out of the cave screaming. When he recovered, he admitted that both he and the missing man had gone to sleep and that he awoke to find his comrade gone. He called, and he says that the answer he received was a peculiar whistling noise which raised all the hair on the back of his neck. He flashed his electric torch all around, but could see nothing. He swears, however, that he heard a slipping, sliding noise approaching him, and he felt that some one was looking at him. He stood it as long as he could and then threw down his rifle and ran for his life."

"Had he been drinking?"

"No. It wasn't delirium either, as was shown by the fact that a patrol found his gun where he had thrown it, but no trace of the other sentry. After this second experience, the guardsmen weren't very eager to enter the cave, and the Governor asked for regulars. A company of infantry was ordered down from Fort Thomas to relieve the guardsmen, but they fared worse than their predecessors. They lost two men the first night of their guard. The regulars weren't caught napping, for the main guard heard five shots fired. They rushed a patrol to the scene and found both of the rifles which had been fired, but the men were gone.

"The officer of the day made a thorough search of the vicinity and found, some two hundred yards from the spot where the sentries had been posted, a crack in the wall through which the body of a man could be forced. This bodycrack had fresh blood on each side of it. Several of his men volunteered to enter the hole and search, but the lieutenant would not allow it. Instead, he armed himself with a couple of hand-

grenades and an electric torch and entered himself. That was last Tuesday, and he has not returned."

"Was there any disturbance heard from the crack?"

"None at all. A guard was posted with two machine-guns pointed at the crack in the wall, and a guard of eight men and a sergeant stationed there. Last night, about six o'clock, while the guard were sitting around their guns, a faint smell of musk became evident. No one paid a great deal of attention to it, but suddenly for no apparent reason at all one of the men on guard was jerked into the air feet upwards. He gave a scream of fear, and an unearthly screech answered him.

[Image description start: A black and white

illustration of the inside of a cave, with a guard being lifted up to the ceiling by the leg, flailing his arms as his hat and falls off, while another character stares in shock and horror. Image description end.]

The guard, with the exception of one man, turned tail and ran. One man stuck by his gun and poured a stream of bullets into the crack. The retreating men could hear the rattle of the gun for a few moments and then there was a choking scream, followed by silence. When the officer of the day got back with a patrol, there was a heavy smell of musk in the air, and a good deal of blood was splashed around. The machine-guns were both there, although one of them was twisted up until it looked like it had been through an explosion.

"The Officer commanding the company investigated the place, ordered all men out of the cave, and communicated with the War Department. The Secretary of War found it too tough a nut to crack and he asked for help, so Bolton is sending me down there. Do you think, in view of this yarn, that your experiments can wait?"

The creases on Dr. Bird's high forehead had grown deeper and deeper as Carnes had told his story, but now they suddenly disappeared, and he jumped to his feet with a boyish grin.

"How soon are we leaving?" he asked.

"In two hours, Doctor. A car is waiting for us downstairs and I have reservations booked for both of us on the Southern to-night. I knew that you were coming; in fact, the request for your services had been approved before I came here to see you."

Dr. Bird rapidly divested himself of his laboratory smock and took his coat and hat from a cupboard.

"I hope you realize, Carnsey, old dear," he said as he followed the operative out of the building, "that I have a real fondness for your worthless old carcass. I am leaving the results of two weeks of patient work alone and unattended in order to keep you out of trouble, and I know that it will be ruined when I get back. I wonder whether you are worth it?"

"Bosh!" retorted Carnes. "I'm mighty glad to have you along, but you needn't rub it in by pretending that it is affection for me that is dragging you reluctantly into this mess. With an adventure like this ahead of you, leg-irons and handcuffs wouldn't keep you away

from Mammoth Cave, whether I was going or not."

It was late afternoon before Dr. Bird and Carnes dismounted from the special train which had carried them from Glasgow Junction to Mammoth Cave. They introduced themselves to the major commanding the guard battalion which had been ordered down to reinforce the single company which had borne the first brunt of the affair, and then interviewed the guards who had been routed by the unseen horror which was haunting the famous cave. Nothing was learned which differed in any great degree from the tale which Carnes had related to the doctor in Washington, except that the officer of the day who had investigated the last attack failed to entirely corroborate the smell of musk which had been reported by the other observers.

"It might have been musk, but to me it smelled differently," he said. "Were you ever near a rattlesnake den in the west?"

Dr. Bird nodded.

"Then you know the peculiar reptilian odor which such a place gives off. Well, this smell was somewhat similar, although not the same by any manner of means. It was musky all right, but it was more snake than musk to me. I rather like musk, but this smell gave me the horrors."

"Did you hear any noises?"

"None at all. The men describe some rather peculiar noises and Sergeant Jervis is an old file and pretty apt to get things straight, but they may have been made by the men who were in trouble. I saw a man caught by a boa in South America once, and the noises he made might very well have been described in almost the same words as Jervis used."

"Thanks, Lieutenant," replied the Doctor. "I'll remember what you have told me. Now I think that we'll go into the cave."

"My orders are to allow no one to enter, Doctor."

"I beg your pardon. Carnes, where is that letter from

the Secretary of War?"

Carnes produced the document. The lieutenant examined it and excused himself. He returned in a few moments with the commanding officer.

"In the face of that letter, Dr. Bird," said the major, "I have no alternative to allowing you to enter the cave, but I will warn you that it is at your own peril. I'll give you an escort, if you wish."

"If Lieutenant Pearce will come with me as a guide, that will be all that I need."

The lieutenant paled slightly, but threw back his shoulders.

"Do you wish to start at once, sir?" he asked.

"In a few moments. What is the floor of the cave like where we are going?"

"Quite wet and slimy, sir."

"Very slippery?"

"Yes, sir."

"In that case before we go in we want to put on baseball shoes with cleats on them, so that we can run if we have to. Can you get us anything like that?"

"In a few moments, sir."

"Good! As soon as we can get them we'll start. In the meantime, may I look at that gun that was found?"

The Browning machine-gun was laid before the doctor. He looked it over critically and sniffed delicately at it. He took from his pocket a phial of liquid, moistened a portion of the water-jacket of the weapon, and then rubbed the moistened part briskly with his hand. He sniffed again. He looked disappointed, and again examined the gun closely.

"Carnes," he said at length, "do you see anything on this gun that looks like tooth marks?"

"Nothing, Doctor."

"Neither do I. There are some marks here which might quite conceivably be finger-prints of a forty-foot giant, and those two parallel grooves look like the result of severe squeezing, but there are no tooth marks. Strange. There is no persistent odor on the gun, which is also strange. Well, there's no use in theorizing: we are confronted by a condition and not a theory, as someone once said. Let's put on those baseball shoes and see what we can find out."

Dr. Bird led the way into the cave, Carnes and the lieutenant following closely with electric torches. In each hand Dr. Bird carried a phosphorus hand-grenade. No other weapons were visible, although the doctor knew that Carnes carried a caliber .45 automatic pistol strapped under his left armpit. As they passed into the cave the lieutenant stepped forward to lead the way.

"I'm going first," said the doctor. "Follow me and indicate the turns by pressure on my shoulder. Don't speak after we have started, and be ready for instant

flight. Let's go."

Forward into the interior of the cave they made their way. The iron cleats of the baseball shoes rang on the floor and the noise echoed back and forth between the walls, dying out in little eerie whispers of sound that made Carnes' hair rise. Ever forward they pressed, the lieutenant guiding the doctor by silent pressure on his shoulder and Carnes following closely. For half a mile they went on until a restrainable pressure brought the doctor to a halt. The lieutenant pointed silently toward a crack in the wall before them. Carnes started forward to examine it, but a warning gesture from the doctor stopped him.

Slowly, an inch at a time, the doctor crept forward, hand-grenades in readiness. Presently he reached the crack and, shifting one of the grenades into his pocket, he drew forth an electric torch and sent a beam of light through the crack into the dark interior of the earth.

For a moment he stood thus, and then suddenly snapped off his torch and straightened up in an

attitude of listening. The straining ears of Carnes and Lieutenant Pearce could hear a faint slithering noise coming toward them, not from the direction of the crack, but from the interior of the cave. Simultaneously a faint, musky, reptilian odor became apparent.

"Run!" shouted the doctor. "Run like hell! It's loose in the cave!"

The lieutenant turned and fled at top speed toward the distant entrance to the cave, Carnes at his heels. Dr. Bird paused for an instant, straining his ears, and then threw a grenade. A blinding flash came from the point where the missile struck and a white cloud rose in the air. The doctor turned and fled after his companions. Not for nothing had Dr. Bird been an athlete of note in his college days. Despite the best efforts of his companions, who were literally running for their lives, he soon caught up with them. As he did so a weird, blood-curdling screech rose from the darkness behind them. Higher and higher in pitch the note rose until it ended suddenly in a gurgling grunt, as though the breath which uttered it had been

suddenly cut off. The slithering, rustling noise became louder on their trail.

"Faster!" gasped the doctor, as he put his hand on Carnes' shoulder and pushed him forward.

The noise of pursuit gained slightly on them, and a sound as of intense breathing became audible. Dr. Bird paused and turned and faced the oncoming horror. His electric torch revealed nothing, but he listened for a moment, and then threw his second grenade. Keenly he watched its flight. It flew through the air for thirty yards and then struck an invisible obstruction and bounded toward the ground. Before it struck the downward motion ceased, and it rose in the air. As it rose it burst with a sharp report, and a wild scream of pain filled the cavern with a deafening roar. The doctor fled again after his companions.

By the time he overtook them the entrance of the cave loomed before them. With sobs of relief they burst out into the open. The guards sprang forward with raised rifles, but Dr. Bird waved them back.

"There's nothing after us, men," he panted. "We got chased a little way, but I tossed our pursuer a handful of phosphorus and it must have burned his fingers a little, judging from the racket he made. At any rate, it stopped the pursuit."

The major hurried up.

"Did you see it, Doctor?" he asked.

"No, I didn't. No one has ever seen it or anything like it. I heard it and, from its voice, I think it has a bad cold. At least, it sounded hoarse, so I gave it a little white phosphorus to make a poultice for its throat, but I didn't get a glimpse of it."

"For God's sake, Doctor, what is it?"

"I can't tell you yet, Major. So far I can tell, it is something new to science and I am not sure just what it looks like. However, I hope to be able to show it to you shortly. Is there a telegraph office here?"

"No, but we have a Signal Corps detachment with us,

and they have a portable radio set which will put us in touch with the army net."

"Good! Can you place a tent at my disposal?"

"Certainly, Doctor."

"All right, I'll go there, and I would appreciate it if you would send the radio operator to me. I want to send a message to the Bureau of Standards to forward me some apparatus which I need."

"I'll attend to it, Doctor. Have you any special advice to give me about the guarding?"

"Yes. Have you, or can you get, any live stock?"

"Live stock?"

"Yes. Cattle preferred, although hogs or sheep will do at a pinch. Sheep will do quite well."

"I'll see what I can do, Doctor."

"Get them by all means, if it is possible to do so. Don't

worry about paying for them: secret service funds are not subject to the same audit that army funds get. If you can locate them, drive a couple of cattle or half a dozen sheep well into the cave and tether them there. If you don't get them, have your sentries posted well away from the cave mouth, and if any disturbance occurs during the night, tell them to break and run. I hope it won't come out, but I can't tell."

A herd of cattle was soon located and two of the beasts driven into the cave. Two hours later a series of horrible screams and bellowings were heard in the cave. Following their orders the sentries abandoned their posts and scattered, but the noise came no nearer the mouth, and in a few minutes silence again reigned.

"I hope that will be all that will be needed for a couple of days," said the doctor to the commanding officer, "but you had better have a couple more cattle driven in in the morning. We want to keep the brute well fed. Is there a tank stationed at Fort Thomas?"

"No, there isn't."

"Then radio Washington that I want the fastest three-man tank that the army has sent here at once. Don't bother with military channels, radio direct to the Adjutant General, quoting the Secretary of the Treasury as authority. Tell him that it's a rush matter, and sign the message 'Bird' if you are afraid of getting your tail twisted."

Twice more before the apparatus which the doctor had ordered from Washington arrived cattle were driven into the depths of the cave, and twice were the screams and bellowings from the cave repeated. Each time searching parties found the cattle gone in the morning. A week after the doctor's arrival, a special train came up, carrying four mechanics from the Bureau of Standards, together with a dozen huge packing cases. Under the direction of the doctor the cases were unpacked and the apparatus put together. Before the assembly had been completed the tank which had been requested arrived from Camp Meade, and the Bureau mechanics began to install some of the assembled units in it.

The first apparatus which was installed in the tank

consisted of an electric generator of peculiar design which was geared to the tank motor. The electromotive force thus generated was led across a spark gap with points of a metallic substance. The light produced was concentrated by a series of parabolic reflectors, directed against a large quartz prism, and thence through a lens which was designed to throw a slightly divergent beam.

"This apparatus," Dr. Bird explained to the Signal Corps officer, who was an interested observer, "is one which was designed at the Bureau for the large scale production of ultra-violet light. There is nothing special about the generator except that it is highly efficient and gives an almost constant electromotive force. The current thus produced is led across these points, which are composed of magnalloy, a development of the Bureau. We found on investigation that a spark gave out a light which was peculiarly rich in ultra-violet rays when it was passed between magnesium points. However, such points could not be used for the handling of a steady current because of lack of durability and ease of fusion, so a mixture of

graphite, alundum and metallic magnesium was pressed together with a binder which will stand the heat. Thus we get the triple advantages of ultra-violet light production, durability, and high resistance.

"The system of reflectors catches all of the light thus produced except the relatively small portion which goes initially in the right direction, and directs it on this quartz prism where, due to the refractive powers of the prism, the light is broken up into its component parts. The infra-red rays and that portion of the spectrum which lies in the visible range, that is, from red to violet inclusive, are absorbed by a black body, leaving only the ultra-violet portion free to send a beam through this quartz lens."

"I thought that a lens would absorb ultra-violet light," objected the signal officer.

"A lens made of glass will, but this lens is made of rock crystal, which is readily permeable to ultra-violet. The net result of this apparatus is that we can

direct before us as we move in the tank a beam of light which is composed solely of the ultra-violet portion of the spectrum."

"In other words, an invisible light?"

"Yes. That is, invisible to the human eye. The effect of this beam of ultra-violet light in the form of severe sunburn would be readily apparent if you exposed your skin to it for any length of time, and the effects on your eyesight of continued gazing would be apt to be disastrous. It would produce a severe opthalmia and temporary impairment of the vision, somewhat the same symptoms as are observed in snow blindness."

"I see. May I ask what is the object of the whole thing?"

"Surely. Before we can successfully combat this peculiar visitant from another world, it is necessary that we gain some idea of the size and appearance of it. Nothing of the sort has before made its appearance, so far as the annals of science go, and so

I am forced to make some rather wild guesses at the nature of the animal. You are probably aware of the fact that the property of penetration possessed by all waves is a function of their frequency, or, perhaps I should say, of their wave-length?"

"Certainly."

"The longer rays of visible light will not penetrate as deeply into a given substance as the shorter ultra-violet rays. This visitor is evidently from some unexplored and, indeed, unknown cavern in the depths of the earth where visible light has never penetrated. Apparently in this cavern the color of the inhabitants is ultra-violet, and hence invisible to us."

"You are beyond my depth, Doctor."

"Pardon me. You understand, of course, what color is? When sunlight, which is a mixture of all colors from infra-red to ultra-violet inclusive, falls on an object, certain rays are reflected and certain others are absorbed. If the red rays are reflected and all others absorbed, the object appears red to our eyes. If all the

rays are reflected, the object appears white, and if all are absorbed, it appears black."

"I understand that."

"The human eye cannot detect ultra-violet. Suppose then, that we have an object, either animate or inanimate, the surface of which reflects only ultra-violet light, what will be the result? The object will be invisible."

"I should think it would be black if all the rays except the ultra-violet were absorbed."

"It would, but mark, I did not say the others were absorbed. Are you familiar with fluorescein?"

"No."

"I think you are. It is the dye used in making changeable silk. If we fill a glass container with a fluorescein solution and look at it by reflected light it appears green. If we look at it by transmitted light, that is, light which has traversed the solution, it

appears red. In other words, this is a substance which reflects green light, allows a free passage to red light, and absorbs all other light. This creature we are after, if my theory is correct, is composed of a substance which allows free passage to all of the visible light rays and at the same time reflects ultra-violet light. Do I make this clear?"

"Perfectly."

"Very well, then. My apparatus will project forward a beam of ultra-violet light which will be in much greater concentration than exists in an incandescent electric light. It is my hope that this light will be reflected by the body of the creature to a sufficient to allow me to make a photograph of it."

"But won't your lens prevent the ultra-violet light from reaching your plate?"

"An ordinary lens made of optical glass would do so, but I have a camera here equipped with a rock crystal lens, which will allow ultra-violet light to pass through it practically unhindered, and with very slight

distortion. When I add that I will have my camera charged with X-ray film, a film which is peculiarly sensitive to the shorter wave-lengths, you will see that I will have a fair chance of success."

"It sounds logical. Would you allow me to accompany you when you make your attempt?"

"I will be glad of your company, if you can drive a tank. I want to take Carnes with me, and the tank will only hold two besides the driver."

"I can drive a tractor."

"In that case you should master the tricks of tank driving in short order. Get familiar with it and we'll appoint you as driver. We'll be ready to go in to-night, but I am going to wait a day. Our friend was fed last night, and there is less chance he'll be about."

The early part of the next evening was marked by howls and screams coming from the mouth of the cave. As the night wore on the noises were quite evidently coming nearer and the sentries watched the

cave mouth nervously, ready to bolt and scatter according to their orders at the first alarm. About two A. M. the doctor and Carnes climbed into the tank beside Lieutenant Leffingwell, and the machine moved slowly into the cave. A search-light on the front of the tank lighted the way for them and, attached to a frame which held it some distance ahead of them, was a luckless sheep.

"Keep your eye on the mutton, Carnes," cautioned the doctor. "As soon as anything happens to it, shut off the search-light and let me try to get a picture. As soon as I have made my exposures I'll tell you, and you can snap it on again. Lieutenant, when the picture is made, turn your tank and make for the entrance to the cave. If we are lucky, we'll get out."

Forward the tank crawled, the sheep bleating and trying to break loose from the bonds which held it. It was impossible to hear much over the roar of the motor, but presently Dr. Bird leaned forward, his eyes shining.

"I smell musk," he announced. "Get ready for action."

Even as he spoke the sheep was suddenly lifted into the air. It gave a final bleat of terror, and then its head was torn from its body.

"Quick, Carnes!" shouted the doctor.

The search-light went out, and Carnes and the lieutenant could hear the slide of the ultra-violet light which Dr. Bird was manipulating open. For two or three minutes the doctor worked with his apparatus.

"All right!" he cried suddenly. "Lights on and get out of here!"

Carnes snapped on the search-light and Lieutenant Leffingwell swung the tank around and headed for the cave mouth. For a few feet their progress was unhindered and then the tank ceased its forward motion, although the motor still roared and the track slid on the cave floor. Carnes watched with horror as one side of the tank bent slowly in toward him. There was a rending sound, and a portion of the heavy steel fabric was torn away. Dr. Bird bent over something on the floor of the tank. Presently he straightened up and

threw a small object into the darkness. There was a flash of light, and bits of flaming phosphorus flew in every direction. The anchor which held the tank was suddenly loosed and the machine crawled forward at full speed, while a roar as of escaping air mingled with a bellowing shriek burdened the smoke-laden air.

"Faster!" cried the doctor, as he threw another grenade.

Lieutenant Leffingwell got the last bit of speed possible out of the tank and they reached the cave mouth without further molestation.

"I had an idea that our friend wouldn't care to pass through a phosphorus screen," said Dr. Bird with a chuckle as he climbed out of the tank. "He must have been rather severely burned the other day, and once burned is usually twice shy. Where is Major Brown?"

The commanding officer stepped forward.

"Drive a couple of cattle into the cave, Major," directed Dr. Bird. "I want to fill that brute up and

keep him quiet for a while. I'm going to develop my films."

Lieutenant Leffingwell and Carnes peered over the doctor's shoulders as he manipulated his films in a developing bath. Gradually vague lines and blotches made their appearance on one of the films, but the form was indistinct. Dr. Bird dropped the films in a fixing tank and straightened up.

"We have something, gentlemen," he announced, "but I can't tell yet how clear it is. It will take those films fifteen minutes to fix, and then we'll know."

In a quarter of an hour he lifted the first film from the tank and held it to the light. The film showed a blank. With an exclamation of disappointment he lifted a second and third film from the tank, with the same result. He raised the fourth one.

"Good Lord!" gasped Carnes.

In the plate could be plainly seen the hind quarters of the sheep held in the grasp of such a monster as even

the drug-laden brain of an opium smoker never pictured. Judging from the sheep, the monster stood about twenty feet tall, and its frame was surmounted by a head resembling an overgrown frog. Enormous jaws were opened to seize the sheep but, to the amazement of the three observers, the jaws were entirely toothless. Where teeth were to be expected, long parallel ridges of what looked like bare bone, appeared, without even a rudimentary segregation into teeth. The body of the monster was long and snakelike, and was borne on long, heavy legs ending in feet with three long toes, armed with vicious claws. The crowning horror of the creature was its forelegs. There were of enormous length, thin and attenuated looking, and ended in huge misshapen hands, knobby and blotched, which grasped the sheep in the same manner as human hands. The eyes were as large as dinner plates, and they were glaring at the camera with an expression of fiendish malevolence which made Carnes shudder.

"How does that huge thing ever get through that crack we examined?" demanded the lieutenant.

Dr. Bird rubbed his head thoughtfully.

"It's not an amphibian," he muttered, "as is plainly shown by the shape of the limbs and the lack of a tail, and yet it appears to have scales of the true fish type. It corresponds to no recovered fossil, and I am inclined to believe it is unique. The nervous organisation must be very low, judging from the lack of forehead and the general conformation. It has enormous strength, and yet the arms look feeble."

"It can't get through that crack," insisted the lieutenant.

"Apparently not," replied the doctor. "Wait a moment, though. Look at this!"

He pointed to the great disproportion between the length and diameter of the forelegs, and then to the hind legs.

"Either this is grave distortion or there is something mighty queer about that conformation. No animal could be constructed like that."

He turned the film so that an oblique light fell on it. As he did so he gave a cry of astonishment.

"Look here!" he said sharply. "It does get through that crack! Look at those arms and hands! There is the answer. This creature is tall and broad, but from front to rear it can measure only a few inches. The same must be true of the froglike head. That animal has been developed to live and move in a low roofed cavern, and to pass through openings only a few inches wide. Its bulk is all in two dimensions!"

"I believe you're right," said Carnes as he studied the film.

"There is no doubt of it," answered the doctor. "Look at those paws, too, Carnes. That substance isn't bone, it's gum. The thing is so young and helpless that it hasn't cut its teeth yet. It must be a baby, and that is the reason why it made its way into the cave when no other of its kind ever has."

"How large are full grown ones if this is a baby?" asked the lieutenant.

"The Lord alone knows," replied Dr. Bird. "I hope that I never have to face one and find out. Well, now that we know what we are fighting, we ought to be able to settle its hash."

"High explosive?" suggested the lieutenant.

"I don't think so. With such a low nervous organization, we would have to tear it practically to pieces to kill it, and I am anxious to keep it from mutilation for scientific study. I have an idea, but I'll have to study a while before I am sure of the details. Send me the radio operator."

The next day the Bureau mechanics began to dismount the apparatus from the tank and to assemble another elaborate contrivance. Before they had made an end of the work additional equipment arrived from Washington, which was incorporated in the new set-up. At length Dr. Bird pronounced himself ready for the attempt.

Under his direction, three cattle were driven into the cave and there tethered. They were there the next morning unharmed, but the second night the now familiar bellowing and howling came from the depths of the cave and in the morning two of the cattle were gone.

"That will keep him quiet for a day or two," said the doctor, "and now to work!"

The tank made its way into the cave, dragging after it two huge cables which led to an engine-driven generator outside the cave. These cables were attached to the terminals of a large motor which was set up in the cave near the place where the cattle were customarily tethered. This motor was the actuating force which turned two generators, one large and one small. The smaller one was mounted on a platform on wheels, which also contained the spark gaps, the reflectors and other apparatus which produced the beam of ultra-violet light which had been used to photograph the monster.

From the larger generator led two copper bars. One

of these was connected to a huge copper plate which was laid flat on the floor of the cave. The other led to a platform which was erected on huge porcelain insulators some fifteen feet above the floor. Huge condensers were set up on this platform, and Dr. Bird announced himself in readiness.

A steer was dragged into the cave and up a temporary runway which led to the platform containing the condensers, and there tied with the copper bus bar from the larger generator fastened to three flexible copper straps which led around the animal's body. When this had been completed, everyone except the doctor, Carnes, and Lieutenant Leffingwell left the cave. These three crouched behind the search-light which sent a mild beam of ultra-violet onto the platform where the steer was held. The engine outside the cave was started, and the three men waited with tense nerves.

For several hours nothing happened. The steer tried from time to time to move and, finding it impossible, set up plaintive bellows for liberty.

"I wish something would happen," muttered the lieutenant. "This is getting on my nerves."

"Something is about to happen," replied Dr. Bird grimly. "Listen to that steer."

The bellowing of the steer had suddenly increased in volume and, added to the note of discontent, was a note of fright which had previously been absent. Dr. Bird bent over his ultra-violet search-light and made some adjustments. He handed a helmetlike arrangement to each of his companions and slipped one on over his head.

"I can't see a thing, Doctor," said Carnes in a muffled voice.

"The objects at which you are looking absorb rather than reflect ultra-violet light," said the doctor. "This is a sort of a fluoroscope arrangement, and it isn't perfect at all. However, when the monster comes along, I am pretty sure that you will be able to see it. You may see a little more as your eyes get accustomed to it."

"I can see very dimly," announced the lieutenant in a moment.

Dimly the walls of the cave and the platform before them began to take vague shape. The three stared intently down the beam of ultra-violet light which the doctor directed down the passageway leading deeper into the cave.

"Good Lord!" ejaculated Carnes suddenly.

Slowly into the field of vision came the hideous figure they had seen on the film. As it moved forward a rustling, slithering sound could be heard, even over the bellowing of the steer and the hum of the apparatus. The odor of musk became evident.

Along the floor toward them the thing slid. Presently it reared up on its hind legs and its enormous bulk became evident. It turned somewhat sideways and the correctness of Dr. Bird's hypothesis as to its peculiar shape was proved. All of the bulk of the creature was in two dimensions. Forward it moved, and the horrible human hands stretched forward, while the mouth

split in a wide, toothless grin. Nearer the doomed steer the creature approached, and then the reaching hands closed on the animal.

There was a blinding flash, and the monster was hurled backward as though struck by a thunderbolt, while a horrible smell of musk and burned flesh filled the air.

"After it! Quick!" cried the doctor as he sprang forward.

Before he could reach the prostrate creature it moved and then, slowly at first, but with rapidly gaining speed, it slithered over the floor in retreat. Dr. Bird's hand swung through an arc, and there was a deafening crash as a hand-grenade exploded on the back of the fleeing monster.

An unearthly scream came from the creature, and its motion changed from a steady forward glide to a series of convulsive jerks. Leffingwell and Carnes threw grenades, but they went wide of their mark, and the monster began to again increase its speed.

Another volley of grenades was thrown and one hit scored, which slowed the monster somewhat but did not arrest the steady forward movement.

"Any more bombs?" demanded the doctor.

"Damn!" he cried as he received negative answers.

"The current wasn't strong enough. It's going to get away."

Carnes jerked his automatic from under his armpit and poured a stream of bullets into the fleeing monster. Slower and slower the motion of the creature became, and its movements again became jerky and convulsive.

"Keep it in sight!" cried the doctor. "We may get it yet!"

Cautiously the three men followed the retreating horror, Leffingwell pushing before him the platform holding the ultra-violet ray apparatus. The chase led them over familiar ground.

"There is the crack!" cried the lieutenant.

"Too late!" replied the doctor.

He rushed forward and seized the lower limb of the monster and tried with all his strength to arrest its flight, but despite all that he could do it slid sideways through the crack in the wall and disappeared. A final backward kick of its leg threw the doctor twenty feet against the far wall of the cave.

"Are you hurt, Doctor?" cried Carnes.

"No, I'm all right. Put on your masks and start the gas! Quick! That may stop it before it gets in far!"

The three adjusted gas masks and thrust the mouths of two gas cylinders which were on the light truck into the crack, and opened the valves. The hissing of the gas was accompanied by a thrashing, writhing sound from the bowels of the earth for a few minutes, but the sound retreated and finally died away into an utter silence.

"And that's that!" cried the doctor half an hour later as they took off their gas masks outside the cave. "It got away from us. Carnes, how soon can we get a train back to Washington?"

"What kind of a report are you going to make to the Bureau, Doctor?" asked Carnes as they sat in the smoker of a southern train, headed for the capital.

"I'm not going to put in any report, Carnes," replied the doctor. "I haven't got the creature or any part of it to show, and no one would believe me. I am going to maintain a discreet silence about the whole matter."

"But you have your photograph to show, Doctor, and you have my evidence and Lieutenant Leffingwell's."

"The photograph might have been faked and I might have doped both of you. In any case, your words are no better than mine. No, indeed, Carnes, when I failed to make the current strong enough to kill it outright I made the first of the moves which bind me to silence, although I thought that two hundred thousand volts would be enough.

"The second failure I made was when I missed him with my second grenade, although I doubt if all six would have stopped him. My third failure was when we failed to get a sufficient concentration of cyanide gas into that hole in a hurry. The thing is so badly crippled that it will die, but it may take hours, or even days, for it to do so. It has already made its way so far into the earth that we couldn't reach it by blasting without danger of bringing the whole place down on our heads. Even if we could blast our way into the place it came from I wouldn't dare open a path which would allow Lord only knows what terrible monsters to invade the earth. When the soldiers have finished stopping that crack with ten feet of solid masonry, I think the barrier will hold, even against that critter's papa and mamma and all its relatives. Then Mammoth Cave will be safe for visitors again. That latter fact is the only report which I will make."

"It is a dandy story to go to waste," said Carnes soberly.

"Tell it then, if you wish, and get laughed at for your pains. No, Carnes, you must learn one thing. A man

like Bolton, for instance, will implicitly believe that a four leaf clover in his watch-charm will bring him good luck, and that carrying a buckeye keeps rheumatism away from him; but tell him a bit of sober fact like this, attested by three reliable witnesses and a good photograph, and you'll just get laughed at for your pains. I'm going to keep my mouth shut."

"So be it, then!" replied Carnes with a sigh.

#03 Phantoms Of Reality, by Ray Cummings:

Red Sensua's knife came up dripping—and the two adventurers knew that chaos and bloody revolution had been unleashed in that shadowy kingdom of the fourth dimension.

Chapter 1: Wall Street—or the Open Road?

When I was some fifteen years old, I once made the remark, "Why, that's impossible."

The man to whom I spoke was a scientist. He replied gently, "My boy, when you are grown older and wiser you will realize that nothing is impossible."

Somehow, that statement stayed with me. In our

swift-moving wonderful world I have seen it proven many times. They once thought it impossible to tell what lay across the broad, unknown Atlantic Ocean. They thought the vault of the heavens revolved around the earth. It was impossible for it to do anything else, because they could see it revolve. It was impossible, too, for anything to be alive and yet be so small that one might not see it. But the microscope proved the contrary. Or again, to talk beyond the normal range of the human voice was impossible, until the telephone came to show how simply and easily it might be done.

I never forgot that physician's remark. And it was repeated to me some ten years later by my friend, Captain Derek Mason, on that memorable June night of 1929.

My name is Charles Wilson. I was twenty-five that June of 1929. Although I had lived all of my adult life in New York City, I had no relatives there and few friends.

I had known Captain Mason for several years. Like

myself, he seemed one who walked alone in life. He was an English gentleman, perhaps thirty years old. He had been stationed in the Bermudas, I understood, though he seldom spoke of it.

I always felt that I had never seen so attractive a figure of a man as this Derek Mason. An English aristocrat, he was, straight and tall and dark, and rather rakish, with a military swagger. He affected a small, black mustache. A handsome, debonair fellow, with an easy grace of manner: a modern d'Artagnan. In an earlier, less civilized age, he would have been expert with sword and stick, I could not doubt. A man who could capture the hearts of women with a look. He had always been to me a romantic figure, and a mystery that seemed to shroud him made him no less so.

A friendship had sprung up between Derek Mason and me, perhaps because we were such opposite types! I am an American, of medium height, and medium build. Ruddy, with sandy hair. Derek Mason was as meticulous of his clothes, his swagger uniforms, as the most perfect Beau Brummel. Not so

myself. I am careless of dress and speech.

I had not seen Derek Mason for at least a month when, one June afternoon, a note came from him. I went to his apartment at eight o'clock the same evening. Even about his home there seemed a mystery. He lived alone with one man servant. He had taken quarters in a high-class bachelor apartment building near lower Fifth Avenue, at the edge of Greenwich Village.

All of which no doubt was rational enough, but in this building he had chosen the lower apartment at the ground-floor level. It adjoined the cellar. It was built for the janitor, but Derek had taken it and fixed it up in luxurious fashion. Near it, in a corner of the cellar, he had boarded off a square space into a room. I understood vaguely that it was a chemical laboratory. He had never discussed it, nor had I ever been shown inside it. Unusual, mysterious enough, and that a captain of the British military should be an experimental scientist was even more unusual. Yet I had always believed that for a year or two Derek had been engaged in some sort of chemical or physical

experiment. With all his military swagger he had the precise, careful mode of thought characteristic of the man of scientific mind.

I recall that when I got his note with its few sentences bidding me come to see him, I had a premonition that it marked the beginning of something strange. As though the portals of a mystery were opening to me!

Nothing is impossible! Nevertheless I record these events into which I was plunged that June evening with a very natural reluctance. I expect no credibility. If this were the year 2000, my narrative doubtless would be tame enough. Yet in 1929 it can only be called a fantasy. Let it go at that. The fantasy of to-day is the sober truth of to-morrow. And by the day after, it is a mere platitude. Our world moves swiftly.

Derek received me in his living-room. He admitted me himself. He told me that his man servant was out. It was a small room, with leather-covered easy chairs, rugs on its hardwood floor, and sober brown portieres at its door and windows. A brown parchment shade shrouded the electrolier on the table. It was the only

light in the room. It cast its mellow sheen upon Derek's lean graceful figure as he flung himself down and produced cigarettes.

He said, "Charlie, I want a little talk with you. I've something to tell you—something to offer you."

He held his lighter out to me, with its tiny blue alcohol flame under my cigarette. And I saw that his hand was trembling.

"But I don't understand what you mean," I protested.

He retorted, "I'm suggesting that you might be tired of being a clerk in a brokerage office. Tired of this humdrum world that we call civilization. Tired of Wall Street."

"I am, Derek. Heavens, that's true enough."

His eyes held me. He was smiling half whimsically: his voice was only half serious. Yet I could see, in the smoldering depths of those luminous dark eyes, a deadly seriousness that belied his smiling lips and his

gay tone.

He interrupted me with, "And I offer you a chance for deeds of high adventuring. The romance of danger, of pitting your wits against villainy to make right triumph over wrong, and to win for yourself power and riches—and perhaps a fair lady...."

"Derek, you talk like a swashbuckler of the middle ages."

I thought he would grin, but he turned suddenly solemn.

"I'm offering to make you henchman to a king, Charlie."

"King of what? Where?"

He spread his lean brown hands with a gesture. He shrugged. "What matter? If you seek adventure, you can find it—somewhere. If you feel the lure of romance—it will come to you."

I said, "Henchman to a king?"

But still he would not smile. "Yes. If I were king. I'm serious. Absolutely. In all this world there is no one who cares a damn about me. Not in this world, but...."

He checked himself. He went on, "You are the same. You have no relatives?"

"No. None that ever think of me."

"Nor a sweetheart. Or have you?"

"No," I smiled. "Not yet. Maybe never."

"But you are too interested in Wall Street to leave it for the open road?" He was sarcastic now. "Or do you fear deeds of daring? Do you want to right a great wrong? Rescue an oppressed people, overturn the tyranny of an evil monarch, and put your friend and the girl he loves upon the throne? Or do you want to go down to work as usual in the subway to-morrow morning? Are you afraid that in this process of becoming henchman to a king you may perchance get

killed?"

I matched his caustic tone. "Let's hear it, Derek."

Chapter 2: The Challenge of the Unknown

Incredible! Impossible! I did not say it, though my thoughts were written on my face, no doubt.

Derek said quietly, "Difficult to believe, Charlie? Yes! But it happens to be true. The girl I love is not of this world, but she lives nevertheless. I have seen her, talked with her. A slim little thing—beautiful...."

He sat staring. "This is nothing supernatural, Charlie. Only the ignorant savages of our past called the unknown—the unusual—supernatural. We know better now."

I said, "This girl—"

He gestured. "As I told you, I have for years been working on the theory that there is another world, existing here in this same space with us. The Fourth Dimension! Call it that if you like. I have found it,

proved its existence! And this girl—her name is Hope—lives in it. Let me tell you about her and her people. Shall I?"

My heart was pounding so that it almost smothered me. "Yes, Derek."

"She lives here, in this Space we call New York City. She and her people use this same Space at the same time that we use it. A different world from ours, existing here now with us! Unseen by us. And we are unseen by them!

"A different form of matter, Charlie. As tangible to the people of the other realm as we are to our own world. Humans like ourselves."

He paused, but I could find no words to fill the gap. And presently he went on:

"Hope's world, co-existing here with us, is dependent upon us. They speak what we call English. They shadow us."

I murmured, "Phantoms of reality."

"Yes. A world very like ours. But primitive, where ours is civilized."

He paused again. His eyes were staring past me as though he could see through the walls of the cellar room into great reaches of the unknown. What a strange mixture was this Derek Mason! What a strange compound of the cold reality of the scientist and the fancy of the romantic dreamer! Yet I wonder if that is not what science is. There is no romantic lover gawping at the moon who could have more romance in his soul, or see in the moonlit eyes of his loved one more romance than the scientist finds in the wonders of his laboratory.

Derek went on slowly:

"A primitive world, primitive nation, primitive passions! As I see it now, Charlie—as I know it to be—it seems as though perhaps Hope's world is merely a replica of ours, stripped to the primitive. As though it might be the naked soul of our modern New York,

ourselves as we really are, not as we pretend to be."

He roused himself from his reverie.

"Hope's nation is ruled by a king. An emperor, if you like. A monarch, beset with the evils of luxury and ease, and wine and women. He is surrounded by his nobles, the idle aristocracy, by virtue of their birth proclaiming themselves of too fine a clay to work. The crimson nobles, they are called. Because they affect crimson cloaks, and their beautiful women, voluptuous, sex-mad, are wont to bedeck themselves in veils and robes of crimson.

"And there are workers, toilers they call them. Oppressed, down-trodden toilers, with hate for the nobles and the king smoldering within them. In France there was such a condition, and the bloody revolution came of it. It exists here now. Hope was born in the ranks of these toilers, but has risen by her grace and beauty to a position in the court of this graceless monarch."

He leaped from his chair and began pacing the room.

I sat silent, staring at him. So strange a thing! Impossible? I could not say that. I could only say, incredible to me. And as I framed the thought I knew its incredibility was the very measure of my limited intelligence, my lack of knowledge. The vast unknown of nature, so vast that everything which was real to me, understandable to me, was a mere drop in the ocean of the existing unknown.

"Don't you understand me now?" Derek added vehemently. "I'm not talking fantasy. Cold reality! I've found a way to transport myself—and you—into this different state of matter, into this other world! I've already made a test. I went there and stayed just for a few moments, a night or so ago."

It made my heart leap wildly. He went on:—

"There is chaos there. Smoldering revolution which at any time—to-night perhaps—may burst into conflagration and destroy this wanton ruling class." He laughed harshly. "In Hope's world the workers are a primitive, ignorant people. Superstitious. Like the peons of Mexico, they're all primed and ready to

shout for any leader who sets himself up. My chance
—our chance—"

He suddenly stopped his pacing and stood before me.
"Don't you feel the lure of it? The open road? 'The
road is straight before me and the Red Gods call for
me!' I'm going, Charlie. Going to-night—and I want
you to go with me! Will you?"

Would I go? The thing leaped like a menacing shadow
risen solidly to confront me. Would I go?

Suddenly there was before me the face of a girl.
White. Apprehensive. It seemed almost pleading. A
face beautiful, with a mouth of parted red lips. A face
framed in long, pale-golden hair with big staring blue
eyes. Wistful eyes, wan with starlight—eyes that
seemed to plead.

I thought, "Why, this is madness!" I was not seeing
this face with my eyes. There was nothing, no one
here in the room with me but Derek. I knew it. The
shadows about us were empty. I was conjuring the
face only from Derek's words, making real that which

existed only in my imagination.

Yet I knew that in another realm, with my thoughts now bridging the gap, the girl was real. Would I go into the unknown?

The quest of the unknown. The gauntlet of the unknown flung down now before me, as it was flung down before the ancient explorers who picked up its challenge and mounted the swaying decks of their little galleons and said, "We'll go and see what lies off there in the unknown."

That same lure was on me now. I heard my voice saying, "Why yes, I guess I'll go, Derek."

Chapter 3: Into the Unknown

We stood in the boarded room which was Derek's laboratory. Our preparations had been simple: Derek had made them all in advance. There was little left to do. The laboratory was a small room of board walls, board ceiling and floor. Windowless, with a single door opening into the cellar of the apartment house.

Derek had locked the door after us as we entered. He said, "I have sent my man servant away for a week. The people in the house here think I have gone away on a vacation. No one will miss us, Charlie—not for a time, anyway."

No one would miss me, save my employers, and to them I would no doubt be small loss.

We had put out the light in Derek's apartment and locked it carefully after us. This journey! I own that I was trembling, and frightened. Yet a strange eagerness was on me.

The cellar room was comfortably furnished. Rugs were on its floor. Whatever apparatus of a research laboratory had been here was removed now. But the evidence of it remained—Derek's long search for this secret which now he was about to use. A row of board shelves at one side of the room showed where bottles and chemical apparatus had stood. A box of electrical tools and odds and ends of wire still lay discarded in a corner of the room. There was a tank of running water, and gas connections, where no doubt bunsen

burners had been.

Derek produced his apparatus. I sat on a small low couch against the wall and watched him as he stripped himself of his clothes. Around his waist he adjusted a wide, flat, wire-woven belt. A small box was fastened to it in the middle of the back—a wide, flat thing of metal, a quarter of an inch thick, and curved to fit his body. It was a storage battery of the vibratory current he was using. From the battery, tiny threads of wire ran up his back to a wire necklace flat against his throat. Other wires extended down his arms to the wrists. Still others down his legs to the ankles. A flat electrode was connected to the top of his head like a helmet. I was reminded as he stood there, of medical charts of the human body with the arterial system outlined. But when he dressed again and put on his jaunty captain's uniform, only the electrode clamped to his head and the thin wires dangling from it in the back were visible to disclose that there was anything unusual about him.

He said smilingly, "Don't stare at me like that."

I took a grip on myself. This thing was frightening, now that I actually was embarked on it. Derek had explained to me briefly the workings of his apparatus. A vibratory electronic current, for which as yet he had no name, was stored in the small battery. He had said:

"There's nothing incomprehensible about this, Charlie. It's merely a changing of the vibration rate of the basic substance out of which our bodies are made. Vibration is the governing factor of all states of matter. In its essence what we call substance is wholly intangible. That is already proven. A vortex! A whirlpool of nothingness! It creates a pseudo-substance which is the only material in the universe. And from this, by vibration, is built the complicated structure of things as we see and feel them to be, all dependent upon vibration. Everything is altered, directly as the vibratory rate is changed. From the most tenuous gas, to fluids to solids—throughout all the different states of matter the only fundamental difference is the rate of vibration."

I understood the basic principle of this that he was explaining—that now when this electronic current

which he had captured and controlled was applied to our physical body, the vibration rate of every smallest and most minute particle of our physical being was altered. There is so little in the vast scale of natural phenomena of which our human senses are cognisant! Our eyes see the colors of the spectrum, from red to violet. But a vast invisible world of color lies below the red of the rainbow! Physicists call it the infra-red. And beyond the violet, another realm—the ultra-violet. With sound it is the same. Our audible range of sound is very small. There are sounds with too slow a vibratory rate for us to hear, and others too rapid. The differing vibratory rate from most tenuous gas to most substantial solid is all that we can perceive in this physical world of ours. Yet of the whole, it is so very little! This other realm to which we were now going lay in the higher, more rapid vibratory scale. To us, by comparison, a more tenuous world, a shadow realm.

I listened to Derek's words, but my mind was on the practicality of what lay ahead. An explorer, standing upon his ship, may watch his men bending the sails,

raising the anchor, but his mind flings out to the journey's end....

We were soon ready. Derek wore his jaunty uniform, I wore my ordinary business suit. A magnetic field would be about us, so that in the transition anything in fairly close contact with our bodies was affected by the current.

Derek said, "I will go first, Charlie."

"But, Derek—" A fear, greater than the trembling I had felt before, leaped at me. Left here alone, with no one on whom to depend!

He spoke with careful casualness, but his eyes were burning me. "Just sit there, and watch. When I am gone, turn on the current as I showed you and come after me. I'll wait for you."

"Where?" I stammered.

He smiled faintly. "Here. Right here. I'm not going away! Not going to move. I'll be here on the couch

waiting for you."

Terrifying words! He had lowered the couch, bending out its short legs until the frame of it rested on the board floor. He drew a chair up before it and seated me. He sat down on the couch.

He said, "Oh, one other thing. Just before you start, put out the light. We can't tell how long it will be before we return."

Terrifying words!

His right hand was on his left wrist where the tiny switch was placed. He smiled again. "Good luck to us, Charlie!"

Good luck to us! The open road, the unknown!

I sat there staring. He was partly in shadow. The room was very silent. Derek lay propped up on one elbow. His hand threw the tiny switch.

There was a breathless moment. Derek's face was set

and white, but no whiter than my own, I was sure. His eyes were fixed on me. I saw him suddenly quiver and twitch a little.

I murmured, "Derek—"

At once he spoke, to reassure me. "I'm all right, Charlie. That was just the first feel of it."

There was a faint quivering throb in the room, like a tiny distant dynamo throbbing. The current was surging over Derek; his legs twitched.

A moment. The faint throbbing intensified. No louder, but rapid, infinitely more rapid. A tiny throb, an aerial whine, faint as the whirring wings of a humming bird. It went up the scale, ascending in pitch, until presently it was screaming with an aerial microscopic voice.

But there seemed no change in Derek. His uniform was glowing a trifle, that was all. His face was composed now; he smiled, but did not speak. His eyes roved away from me, as though now he were seeing

things that I could not see.

Another moment. No change.

Why, what was this? I blinked, gasped. There was a change! My gaze was fastened upon Derek's white face. White? It was more than white now! A silver sheen seemed to be coming to his skin!

I think no more than a minute had passed. His face was glowing, shimmering. A transparent look was coming to it, a thinness, a sudden unsubstantiality! He dropped his elbow and lay on the couch, stretched at full length at my feet. His eyes were staring.

And suddenly I realized that the face that held those staring eyes was erased! A shimmering apparition of Derek was stretched here before me. I could see through it now! Beneath the shimmering, blurred outlines of his body I could see the solid folds of the couch cover. A ghost of Derek here. An apparition—fading—dissipating!

A gossamer outline of him, imponderable, intangible.

I leaped to my feet, staring down over him.

"Derek!"

The shape of him did not move. Every instant it was more vaporous, more unreal.

I thought, "He's gone!"

No! He was still there. A white mist of his form on the couch. Melting, dissipating in the light like a fog before sunshine. A wisp of it left, like a breath, and then there was nothing.

I sat on the couch. I had put out the light. Around me the room was black. My fingers found the small switch at my wrist. I pressed it across its tiny arc.

The first shock was slight, but infinitely strange. A shuddering, twitching sensation ran all over me. It made my head reel, swept a wave of nausea over me, a giddiness, a feeling that I was falling through darkness. I lay on the couch, bracing myself. The current was whining up its tiny scale. I could feel it

now. A tiny throbbing, communicating itself to my physical being.

And then in a moment I realized that my body was throbbing. The vibration of the current was communicating itself to the most minute cells of my body. An indescribable tiny quivering within me. Strange, frightening, sickening at first. But the sickness passed, and in a moment I found it almost pleasant.

I could see nothing. The room was wholly dark. I lay on my side on the couch, my eyes staring into the blackness around me. I could hear the humming of the current, and then it seemed to fade. Abruptly I felt a sense of lightness. My body, lying on the couch, pressed less heavily.

I gripped my arm. I was solid, substantial as before. I touched the couch. It was the couch which was changing, not I! The couch cover queerly seemed to melt under my hand!

The sense of my own lightness grew upon me. A

lightness, a freedom, pressed me, as though chains and shackles which all my life had encompassed me were falling away. A wild, queer freedom.

I wondered where Derek was. Had I arrived in the other realm? Was he here? I had no idea how much time had passed: a minute or two, perhaps.

Or was I still in Derek's laboratory? The darkness was as solid, impenetrable as ever. No, not quite dark! I saw something now. A glowing, misty outline around me. Then I saw that it was not the new, unknown realm, but still Derek's room. A shadowy, spectral room, and the light, which dimly illumined it, was from outside.

I lay puzzling, my own situation forgotten for the moment. The light came from overhead, in another room of the apartment house. I stared. Around me now was a dim vista of distance, and vague, blurred, misty outlines of the apartment building above me. The shadowy world I had left now lay bare. There was a moment when I thought I could see far away across a spectral city street. The shadows of the great city

were around me. They glowed, and then were gone.

A hand gripped my arm in a solid grip. Derek's voice sounded.

"Are you all right?"

"Yes," I murmured. The couch had faded. I was conscious that I had floated or drifted down a few inches, to a new level. The level of the cellar floor beneath the couch. Cellar floor! It was not that now. Yet there was something solid here, a solid ground, and I was lying upon it, with Derek sitting beside me.

I murmured again, "Yes, I'm all right."

My groping hand felt the ground. It was soil, with a growth of vegetation like a grass sward on it. Were we outdoors? It suddenly seemed so. I could feel soft, warm air on my face and had a sense of open distance around me. A light was growing, a vague, diffused light, as though day were swiftly coming upon us.

I felt Derek fumbling at my wrist. "That's all, Charlie."

There was a slight shock. Derek was pulling me up beside him. I found myself on my feet, with light around me. I stood wavering, gripping Derek. It was as though I had closed my eyes, and now they were suddenly open. I was aware of daylight, color, and movement. A world of normality here, normal to me now because I was part of it. The realm of the unknown!

Chapter 4: "*Hope, I Came....*"

I think I was first conscious of a queer calmness which had settled upon me, as though now I had withdrawn contact with the turmoil of our world! Something was gone, and in its place came a calmness. But that was a mere transition. It had passed in a moment. I stood trembling with eagerness, as I know Derek was trembling.

A radiant effulgence of light was around us, clarifying, growing. There was ground beneath our feet, and sky overhead. A rational landscape, strangely familiar. A physical world like my own, but, it seemed, with a new glory upon it. Nature, calmly

serene.

I had thought we were standing in daylight. I saw now it was bright starlight. An evening, such as the evening we had just left in our own world. The starlight showed everything clearly. I could see a fair distance.

We stood at the top of a slight rise. I saw gentle, slightly undulating country. A brook nearby wound through a grove of trees and lost itself. Suddenly, with a shock, I realized how familiar this was! We stood facing what in New York City we call West. The contour of this land was familiar enough for me to identify it. A mile or so ahead lay a river; it shimmered in its valley, with cliffs on its further side. Near at hand the open country was dotted with trees and checkered with round patches of cultivated fields. And there were occasional habitations, low, oval houses of green thatch.

The faint flush of a recent sunset lay upon the landscape, mingled with the starlight. A road—a white ribbon in the starlight—wound over the countryside

toward the river. Animals, strange of aspect, were slowly dragging carts. There were distant figures working in the fields.

A city lay ahead of us, set along this nearer bank of the river. A city! It seemed a primitive village. All was primitive, as though here might be some lost Indian tribe of our early ages. The people were picturesque, the field workers garbed in vivid colors. The flat little carts, slow moving, with broad-horned oxen.

This quiet village, drowsing beside the calm-flowing river, seemed all very normal. I could fancy that it was just after sundown of a quiet workday. There was a faint flush of pink upon everything: the glory of the sun just set. And as though to further my fancy, in the village by the river, like an angelus, a faint-toned bell was chiming.

We stood for a moment gazing silently. I felt wholly normal. A warm, pleasant wind fanned my hot face. The sense of lightness was gone. This was normality to me.

Derek murmured, "Hope was to meet me here."

And then we both saw her. She was coming toward us along the road. A slight, girlish figure, clothed in queerly vivid garments: a short jacket of blue cloth with wide-flowing sleeves, knee-length pantaloons of red, with tassels dangling from them, and a wide red sash about her waist. Pale golden hair was piled in a coil upon her head....

She was coming toward us along the edge of the road, from the direction of the city. She was only a few hundred feet from us when we first saw her, coming swiftly, furtively it seemed. A low pike fence bordered the road. She seemed to be shielding herself in the shadows beside it.

We stood waiting in the starlight. The nearest figures in the field and on the road were too far away to notice us. The girl advanced. Her white arm went up in a gesture, and Derek answered. She left the road, crossing the field toward us. As she came closer, I saw how very beautiful she was. A girl of eighteen, perhaps, a fantastic little figure with her vivid

garments. The starlight illumined her white face, anxious, apprehensive, but eager.

"Derek!"

He said, "Hope, I came...."

I stood silently watching. Derek's arms went out, and the girl, with a little cry, came running forward and threw herself into them.

Chapter 5: Intrigue

"Am I in time, Hope?"

"Yes, but the festival is to-night. In an hour or two now. Oh Derek, if the king holds this festival, the toilers will revolt. They won't stand it—"

"To-night! It mustn't be held to-night! It doesn't give me time, time to plan."

I stood listening to their vehement, half-whispered words. For a moment or two, absorbed, they ignored me.

"The king will make his choice to-night, Derek. He has announced it. Blanca or Sensua for his queen. And if he chooses the Crimson Sensua—" She stammered, then she went on:

"If he does—there will be bloodshed. The toilers are waiting, just to learn his choice."

Derek exclaimed, "But to-night is too soon! I've got to plan. Hope, where does Rohbar stand in this?"

Strange intrigue! I pieced it together now, from their words, and from what presently they briefly told me. A festival was about to be held, an orgy of feasting and merrymaking, of music and dancing. And during it, this young King Leonto was to choose his queen. There were two possibilities. The Crimson Sensua, a profligate, debauched woman who, as queen, would further oppress the workers. And Blanca, a white beauty, risen from the toilers to be a favorite at the Court. Hope was her handmaiden.

If Blanca were chosen, the toilers would be appeased. She was one of them. She would lead this king from

his profligate ways, would win from him justice for the workers.

But Derek and Hope both knew that the pure and gentle Blanca would never be the king's choice. And to-night the toilers would definitely know it, and the smoldering revolt would burst into flame.

And there was this Rohbar. Derek said, "He is the king's henchman, Charlie."

I stood here in the starlight, listening to them. This strange primitive realm. There were no modern weapons here. We had brought none. The current used in our transition would have exploded the cartridges of a revolver. I had a dirk which Hope now gave me, and that was all.

Primitive intrigue. I envisaged this chaotic nation, with its toilers ignorant as the oppressed Mexican peons at their worst. Striving to better themselves, yet, not knowing how. Ready to shout for any leader who might with vainglorious words set himself up as a patriot.

This Rohbar, perhaps, was planning to do just that.

And so was Derek! He said, "Hope, if you could persuade the king to postpone the festival—if Blanca would help persuade him—just until to-morrow night...."

"I can try, Derek. But the festival is planned for an hour or two from now."

"Where is the king?"

"In his palace, near the festival gardens."

She gestured to the south. My mind went back to New York City. This hillock, where we were standing in the starlight beside a tree, was in my world about Fifth Avenue and Sixteenth Street. The king's palace—the festival gardens—stood down at the Battery, where the rivers met in the broad water of the harbor.

Derek was saying, "We haven't much time: can you get us to the palace?"

"Yes. I have a cart down there on the road."

"And the cloaks for Charlie and me?"

"Yes."

"Good!" said Derek. "We'll go with you. It's a long chance; he probably won't postpone it. If he does not, we'll be among the audience. And when he chooses the Red Sensua—"

She shuddered, "Oh, Derek—" And I thought I heard her whisper, "Oh, Alexandre—" and I saw his finger go to his lips.

His arm went around her. She huddled, small as a child against his tall, muscular body.

He said gently, "Don't be afraid, little Hope."

His face was grim, his eyes were gleaming. I saw him suddenly as an instinctive military adventurer. An anachronism in our modern New York City. Born in a wrong age. But here in this primitive realm he was at

home.

I plucked at him. "How can you—how can we dare plunge into this thing? Hidden with cloaks, yes. But you talk of leading these toilers."

He cast Hope away and confronted me. "I can do it! You'll see, Charlie." He was very strangely smiling. "You'll see. But I don't want to come into the open right away. Not to-night. But if we can only postpone this accursed festival."

We had been talking perhaps five minutes. We were ready now to start away. Derek said:

"Whatever comes, Charlie, I want you to take care of Hope. Guard her for me, will you?"

I said, "Yes, I will try to."

Hope smiled as she held out her hand to me. "I will not be afraid, with Derek's friend."

Her English was of different intonation from our own,

but it was her native language, I could not doubt.

I took her cold, slightly trembling hand. "Thank you, Hope."

Her eyes were misty with starlight. Tender eyes, but the tenderness was not for me.

"Yes," I repeated. "You can depend upon me, Derek."

We left the hillock. A food-laden cart came along the road. The driver, a boy vivid in jacket and wide trousers of red and blue, bravely worn but tattered, ran alongside guiding the oxen. When they had passed we followed, and presently we came to the cloaks Hope had hidden. Derek and I donned them. They were long crimson cloaks with hoods.

Hope said, "Many are gathering for the festival shrouded like that. You will not be noticed now."

Further along the road we reached a little eminence. I saw the river ahead of us, and a river behind us. And a few miles to the south, an open spread of water

where the rivers joined. Familiar contours! The Hudson River! The East River. And down at the end of the island, New York Harbor.

Hope gestured that way. "The king's palace is there."

We were soon passing occasional houses, primitive thatched dwellings. I saw inside one. Workers were seated over their frugal evening meal. Always the same vivid garments, jaunty but tattered. We passed one old fellow in a field, working late in the starlight. A man bent with age, but still a tiller of the soil. Hope waved to him and he responded, but the look he gave us as we hurried by shrouded in our crimson cloaks was sullenly hostile.

We came to an open cart. It stood by the roadside. An ox with shaggy coat and spreading horns was fastened to the fence. It was a small cart with small rollers like wheels. Seats were in it and a vivid canopy over it. We climbed in and rumbled away.

And this starlit road in our own world was Broadway! We were presently passing close to the river's edge.

This quiet, peaceful, starlit river! Why, in our world it was massed with docks! Great ocean liners, huge funneled, with storied decks lay here! Under this river, tunnels with endless passing vehicles! Tubes, with speeding trains crowded with people!

The reality here was so different! Behind us what seemed an upper city was strung along the river. Ahead of us also there were streets and houses, the city of the workers. A bell was tolling. Along all the roads now we could see the moving yellow spots of lights on the holiday carts headed for the festival. And there were spots of yellow torchlight from boats on the river.

We soon were entering the city streets. Narrow dirt streets they were, with primitive shacks to the sides. Women came to the doorways to stare at our little cart rumbling hastily past. I was conscious of my crimson cloak, and conscious of the sullen glances of hate which were flung at it from every side, here in this squalid, forlorn section where the workers lived.

Along every street now the carts were passing,

converging to the south. They were filled, most of them, with young men and girls, all in gaudy costumes. Some of them, like ourselves, were shrouded in crimson cloaks. The carts occasionally were piled with flowers. As one larger than us, and moving faster rumbled by, a girl in it stood up and pelted me with blossoms. She wore a crimson robe, but it had fallen from her shoulders. I caught a glimpse of her face, framed in flowing dark hair, and of eyes with laughter in them, mocking me, alluring.

We came at last to the end of the island. There seemed to be a thousand or more people arriving, or here already. The tip of the island had an esplanade with a broad canopy behind it. Burning torches of wood gave flames of yellow, red and blue fire. A throng of gay young people promenaded the walk, watching the arriving boats.

And here, behind the walk at the water's edge, was a garden of trees and lawn, shrubs and beds of tall vivid flowers. Nooks were here to shelter lovers, pools of water glinted red and green with the reflected torchlight. In one of the pools I saw a group of girls

bathing, sportive as dolphins.

To one side at a little distance up the river, banked against the water, was a broad, low building: the palace of the king. About it were broad gardens, with shrubs and flowers. The whole was surrounded by a high metal fence, spiked on top.

The main gate was near at hand; we left our cart. Close to the gate was a guard standing alert, a jaunty fellow in leather pantaloons and leather jacket, with a spiked helmet, and in his hand a huge, sharp-pointed lance. The gardens of the palace, what we could see of them, seemed empty—none but the favored few might enter here. But as I climbed from the cart, I got the impression that just inside the fence a figure was lurking. It started away as we approached the gate. The guard had not seen it—the drab figure of a man in what seemed to be dripping garments, as though perhaps he had swum in from the water.

And Derek saw him. He muttered, "They are everywhere."

Hope led us to the gate. The guard recognized her. At her imperious gesture he stood aside. We passed within. I saw the palace now as a long winged structure of timber and stone, with a high tower at the end of one wing. The building fronted the river, but here on the garden side there was a broad doorway up an incline, twenty feet up and over a small bridge, spanning what seemed a dry moat. Beyond it, a small platform, then an oval archway, the main entrance to the building.

Derek and I, shrouded in our crimson cloaks with hoods covering us to the eyes, followed Hope into the palace.

Chapter 6: The King's Henchmen

The long room was bathed in colored lights. There was an ornate tiled floor. Barbaric draperies of heavy fabric shrouded the archways and windows. It was a totally barbaric apartment. It might have been the audience chamber of some fabled Eastern Prince of our early ages. Yet not quite that either. There was a primitive modernity here. I could not define it, could

not tell why I felt this strangeness. Perhaps it was the aspect of the people. The room was crowded with men and gay laughing girls in fancy dress costumes. Half of them at least were shrouded in crimson cloaks, but most of the hoods were back. They moved about, laughing and talking, evidently waiting for the time to come for them to go to the festival. We pushed our way through them.

Derek murmured, "Keep your hood up, Charlie."

A girl plucked at me. "Handsome man, let me see." She thrust her painted lips up to mine as though daring me to kiss them. Hope shoved her away. Her parted cloak showed her white, beautiful body with the dark tresses of her hair shrouding it. Exotically lovely she was, with primitive, unrestrained passions—typical of the land in which she lived.

"This way," whispered Hope. "Keep close together. Do not speak!"

We moved forward and stood quietly against the wall of the room, where great curtains hid us partly from

view. Under a canopy, at a table on a raised platform near one end of the apartment, sat the youthful monarch. I saw him as a man of perhaps thirty. He was in holiday garb, robed in silken hose of red and white, a strangely fashioned doublet, and a close-fitting shirt. Bare-headed, with thick black hair, long to the base of his neck.

He sat at the table with a calm dignity. But he relaxed here in the presence of his favored courtiers. He was evidently in a high good humor this night, giving directions for the staging of the spectacle, despatching messengers. I stood gazing at him. A very kingly fellow this. There was about him, that strange mingled look of barbarism and modernity.

Hope approached him and knelt. Derek and I could hear their voices, although the babble of the crowd went on.

"My little Hope, what is it? Stand up, child."

She said, "Your Highness, a message from Blanca."

He laughed. "Say no more! I know it already! She does not want this festival. The workers,"—what a world of sardonic contempt he put into that one word!—"the workers will be offended because we take pleasure to-night. Bah!" But he was still laughing. "Say no more, little Hope. Tell Blanca to dance and sing her best this night. I am making my choice. Did you know that?"

Hope was silent. He repeated, "Did you know that?"

"Yes, Your Highness," she murmured.

"I choose our queen to-night, child. Blanca or Sensua." He sighed. "Both are very beautiful. Do you know which one I am going to choose?"

"No," she said.

"Nor do I, little Hope. Nor do I."

He dismissed her. "Go now. Don't bother me."

She parted her lips as though to make another

protest, but his eyes suddenly flashed.

"I would not have you annoy me again. Do you understand?"

She turned away, back toward where Derek and I were lurking. The chattering crowd in the room had paid no attention to Hope, but before she could reach us a man detached himself from a nearby group and accosted her. A commanding figure, he was, I think, quite the largest man in the room. An inch or two taller than Derek, at the least. He wore his red cloak with the hood thrown back upon his wide heavy shoulders. A bullet-head with close-clipped black hair. A man of about the king's age, he had a face of heavy features, and flashing dark eyes. A scoundrel adventurer, this king's henchman.

Hope said, "What is it, Rohbar?"

"You will join our party, little Hope?" He laid a heavy hand on her white arm. His face was turned toward me. I could not miss the gleaming look in his eyes as he regarded her.

"No," she said.

It seemed that he twitched at her, but she broke away from him.

Anger crossed his face, but the desirous look in his eyes remained.

"You are very bold, Hope, to spurn me like this." He had lowered his voice as though fearful that the king might hear him.

"Let me alone!" she said.

She darted away from him, but before she joined us she stood waiting until he turned away.

"No use," Hope whispered. "There is nothing we can do here. You heard what the king said—and the festival is already begun."

Derek stood a moment, lost in thought. He was gazing across the room to where Rohbar was standing with a group of girls. He said at last:

"Come on, Charlie. We'll watch this festival. This damn fool king will choose the Red Sensua." He shrugged. "There will be chaos...."

We shoved our way from the room, went out of the main doorway and hurried through the gardens of the palace. The red-cloaked figures were leaving the building now for the festival grounds. We waited for a group of them to pass so that we might walk alone. As we neared the gate, passing through the shadows of high flowered shrubs, a vague feeling that we were being followed shot through me. In a moment there was so much to see that I forgot it, but I held my hand on my dirk and moved closer to Hope.

We reached the entrance to the canopy. A group of girls, red-cloaked, were just coming out. They rushed past us. They ran, discarding their cloaks. Their white bodies gleamed under the colored lights as they rushed to the pool and dove.

We were just in time. Hope whispered, "The king will be here any moment."

Beneath the canopy was a broad arena of seats. A platform, like a stage, was at one end. It was brilliantly illuminated with colored torches held aloft by girls in flowing robes, each standing like a statue with her light held high. The place was crowded. In the gloom of the darkened auditorium we found seats off to one side, near the open edge of the canopy. We sat, with Hope between us.

Derek whispered, "Shakespeare might have staged a play in a fashion like this."

A primitive theatrical performance. There was no curtain for interlude between what might have been the acts of a vaudeville. The torch girls, like pages, ranged themselves in a line across the front of the stage. They were standing there as we took our seats. The vivid glare of their torches concealed the stage behind them.

There was a few moments wait, then, amid hushed silence, the king with his retinue came in. He sat in a canopied box off to one side. When he was seated, he raised his arm and the buzz of conversation in the

audience began again.

Presently the page girls moved aside from the stage. The buzz of the audience was stilted. The performance, destined to end so soon in tragedy, now began.

Chapter 7: The Crimson Murderess

Hope murmured. "The three-part music comes first. There will first be the spiritual."

An orchestra was seated on the stage in a semi-circle. It was composed of men and women musicians, and there seemed to be over a hundred of them. They sat in three groups; the center group was about to play. In a solemn hush the leaderless choirs, with all its players garbed in white, began its first faint note. I craned to get a clear view of the stage. This white choir seemed almost all wood-wind. There were tiny pipes in little series such as Pan might have used. Flutes, and flageolets; and round-bellied little instruments of clay, like ocarinas. And pitch-pipes, long and slender as a marsh reed.

In a moment I was lost in the music. It began softly, with single muted notes from a single instrument, echoed by the others, running about the choir like a will-o'-the-wisp. It was faint, as though very far away, made more sweet by distance. And then it swelled, came nearer.

I had never heard such music as this. Primitive! It was not that. Nor barbaric! Nothing like the music of our ancient world. Nor was it what I might conceive to be the music of our future. A thing apart, unworldly, ethereal. It swept me, carried me off; it was an exaltation of the spirit lifting me. It was triumphant now. It surged, but there was in its rhythm, the beat of its every instrument, nothing but the soul of purity. And then it shimmered into distance again, faint and exquisite music of a dream. Crooning, pleading, the speech of whispering angels.

It ceased. There was a storm of applause.

I breathed again. Why, this was what music might be in our world but was not. I thought of our blaring jazz.

Hope said, "Now they play the physical music. Then Sensua will dance with Blanca. We will see then which one the king chooses."

On the stage all the torches were extinguished save those which were red. The arena was darker than before. The stage was bathed with a deep crimson. Music of the physical senses! It was, indeed, no more like the other choir than is the body to the spirit.

There were stringed instruments playing now; deep-toned, singing zithers, and instruments of rounded, swelling bodies, like great viols with sensuous, throbbing voices. Music with a swift rhythm, marked by the thump of hollow gourds. It rose with its voluptuous swell into a paeon of abandonment, and upon the tide of it, the crimson Sensua flung herself upon the stage. She stood motionless for a moment that all might regard her. The crimson torchlight bathed her, stained crimson the white flush of her limbs, her heavy shoulders, her full, rounded throat.

A woman in her late twenties. Voluptuous of figure, with crimson veils half-hiding, half-revealing it. A face

of coarse, sensuous beauty. A face wholly evil, and it seemed to me wholly debauched. Dark eyes with beaded lashes. Heavy lips painted scarlet. A pagan woman of the streets. One might have encountered such a woman swaggering in some ancient street of some ancient city, flaunting the finery given her by a rich and profligate eastern prince.

She stood a moment with smoldering, passion-filled eyes, gazing from beneath her lowered lids. Her glance went to the king's canopy, and flashed a look of confidence, of triumph. The king answered it with a smile. He leaned forward over his railing, watching her intently.

With the surge of the music she moved into her dance. Slowly she began, quite slowly. A posturing and swaying of hips like a nautch girl. She made the rounds of the musicians, leering at them. She stood in the whirl of the music, almost ignoring it, stood at the front of the stage with a gaze of slumberous, insolent passion flung at the king. A knife was in her hand now. She held it aloft. The red torchlight caught its naked blade. With shuddering fancy I seemed to see it

dripping crimson. She frowned, and struck it at a phantom lover. She backed away. She stooped and knelt. She knelt and seemed with her empty arms to be caressing a murdered lover's head. She kissed him, rained upon his dead lips her macabre kisses.

And then she was up on her bare feet, again circling the stage. Her anklets clanked as she moved with the tread of a tigress. The musicians shrank from her waving blade.

A girl in white veils was suddenly disclosed standing at the back of the stage.

Derek whispered, "Is that Blanca?"

"Yes," whispered Hope.

Blanca stood watching her rival. The crimson Sensua passed her, took her suddenly by the wrist, drew her forward. For an instant I thought it might have been rehearsed. I saw Blanca as a slim, gentle girl in white, with a white head-dress. A dancer who could symbolize purity, now in the grip of red passion.

An instant, and then horror struck us. And I could feel it surge over the audience. A gasp of horror. The frightened girl in white tried to escape. The musicians wavered and broke. I stared, stricken, with freezing blood. Upon the stage the knife went swiftly up; it came down; then up again. The red Sensua stood gloating. The knife she waved aloft was truly dripping crimson now.

With a choked, gasping scream the white girl of the toilers crumpled and fell.... She lay motionless, at the feet of the crimson murderess.

Chapter 8: "Why, This Is Treason!"

There was a gasp. The audience sat frozen. On the stage, with no one lifting a hand to stop her, the crimson murderess made a leap and vanished. A moment, and then the spell broke. A girl in the audience screamed. Some one moved to stand up and overturned a seat with a crash.

The amphitheater under the canopy broke into a pandemonium. Screams and shouts, crashing of seats,

screaming, frightened people struggling to get out of the darkness. The torches on the stage were dropped and extinguished. The darkness leaped upon us.

Derek and I were gripping Hope. We were struck by a bench flung backward from in front. People were rushing at us. We were swept along in the panic of the crowd.

I heard Derek shout, "We must keep together!"

We fought, but we were swept backward. We found ourselves outside the canopy. Torchlight was here. It glimmered on the pool of water. People were everywhere rushing past us, some one way, some another. Aimless, with the shock of terror upon them. Under the canopy they were still screaming.

I was momentarily separated from Derek and Hope. I very nearly stumbled into the pool. A girl was here, crouched on the stone bank. Her wet crimson veils clung to her white body. Her long, wet hair lay on her. I stumbled against her. She raised her face. Eyes, wide with terror. Mute, painted red lips....

I heard Derek calling again, "Charlie!" I shoved my way back to him. The crowd was thinning out around us. Girls were climbing from the pool, rushing off in terror, to mingle with the milling throng. Among the crowd now, down by the edge of the bay, I saw the sinister figures of men come running. The toilers, miraculously appearing everywhere! I saw, across the pool, a terrified girl crouching. A huge man in a black cloak came leaping. The colored lights in the trees glittered on his upraised knife blade as it descended. The girl fell with a shuddering scream. The murderer turned and whirled away into the crowd.

"Charlie!"

I was back with Derek and Hope. Hope stood trembling, with her hand pressed against her mouth. Derek gripped me.

"That cloak, get it off!" He ripped his crimson cloak from him and tossed it away. He jerked mine off. "Too dangerous! That's the crimson badge of death tonight."

We stood revealed in the clothes of our own world. My business suit, in which that day I had worked in Wall Street. Derek in his swagger uniform. He stood drawn to his full height, a powerful figure. The wires of our mechanism showed at his wrists. They dangled at the back of his neck, mounting to that strangely fashioned electrode clamped to his head. Strange, awe-inspiring figure of a man!

We were momentarily alone under the colored lights of the trees. Hope murmured, "But they will see us—see you...."

Derek's face was grim, but at her words he laughed harshly. "See us! What matter?" He swung on me. "It forces our hand; we've got to come out in the open now! This murder—this king! My God, what a fool to let himself get into such a condition as this! His people—this chaos—what a fool!"

He had drawn his dirk. I realized that I was holding mine. Near us the body of a crimson noble was lying under a tree. A sword was there on the ground. Derek sprang for it, waved it aloft.

I think that no more than a minute or two had passed since the murder. Down by the water the boats were hastily loading and leaving the dock. One of them overturned. There were screams everywhere. Red forms lay inert upon the ground where they had been trampled, or stabbed. But the prowling figures of the toilers now seemed to have vanished.

Derek gestured. "Look at the palace! The garden!"

Beyond the canopy I could see the dim gardens surrounding the palace. I glimpsed the high fence, and the gateway in front. A mob of toilers was there. The guard at the gate had fled. The mob was surging through. Men and women in the vivid garments of the fields, armed with sticks and clubs and stones and the implements of agriculture. They milled at the gate; rushed through; scattered over the garden. Their shouts floated back to us in a blended murmur.

We were standing only a dozen feet from the edge of the pavilion. No one seemed yet to have noticed us. A few straggling lights had come on under the canopy. I could see the dead lying there in the wreckage of

overturned seats.

Derek said, "We can't help it—it's done. Look at them! They're attacking the palace!"

This mob springing miraculously into existence! I realized that the toilers had planned that if Sensua were chosen they would attack the festival. The murder of Blanca had come as big a surprise to them as to us....

"Come on! Can you get into the palace, Hope? The king must have gotten back there. Get your wits, girl!" Derek stood gripping her, shaking her.

"Yea, there's an underground passage. He probably went that way."

From the palace gardens the shouts of the mob sounded louder now. And from within the building there was an alarm bell tumultuously clanging.

Hope gasped, "This way."

She led us back into the pavilion. We clambered over its broken seats, past its grewsome huddled figures. Some were still moving.... We went to a small door under the platform. A dim room was here, deserted now. Against the wall was a large wardrobe closet; stage costumes were hanging in it. The closet was fully twenty feet deep. We pushed our way through the hanging garments. Hope fumbled at the blank board wall in the rear. Her groping fingers found a secret panel. A door swung aside and a rush of dank cool air came at us. The dark outlines of a tunnel stretched ahead.

"In, Charlie!"

I crouched and stepped through the door. Hope closed it behind us. The tunnel passage was black, but soon we began to see its vague outlines. Derek, sword in hand, led us. I clutched my dirk. We went perhaps five hundred feet. Down at first, then up again. I figured we were under the palace gardens now, as the tunnel was winding to the left. There were occasional small lights.

Derek whispered to Hope, "The toilers don't know of this?"

"No."

"Where does it bring us out?" I whispered.

"Into the lower floor of the castle. The king must have gone this way. There might be a guard, Derek. What will you do?"

He laughed. "I can handle this mob. Disperse it! You'll see! And handle the king." He laughed again grimly. "There is no Blanca to choose now."

The tunnel went round a sharp angle and began steeply ascending. Derek stopped.

"How much further, Hope?"

"Not far," she whispered.

We crept forward. The tunnel was more like a small corridor now. Beyond Derek's crouching figure, in the

dimness I could see a doorway. Derek turned and gestured to us to keep back. A palace guard was standing there. His pike went up.

"Who are you?"

"A friend."

But the man lunged with his pike. Derek leaped aside. His sword flashed; the flat of it struck the fellow in the face. Derek, with incredible swiftness, was upon him. They went down together and before the man could shout, Derek had struck him on the head with the sword hilt. The guard lay motionless. Derek climbed up as we ran forward to join him.

I noticed now, for the first time, that in his left hand Derek held a small metal cylinder. A weapon, strange to me, which he had brought with him. He had not mentioned it. He had produced it, when menaced by this guard. Then he evidently decided not to use it.

He shoved it back in his pocket. He whirled on us, panting. "Hurry! Close that door!"

We closed the door of the tunnel.

"Charlie, help me move him!"

We dragged the prostrate figure of the unconscious guard aside into a shadow of the wall. We were in a lower room of the palace. It seemed momentarily unoccupied. Overhead we could hear the footsteps of running people. A confusion in the palace, and outside in the garden the shouts of the menacing throng of toilers. And above it all, the wild clanging of the alarm bell from the palace tower.

Derek said swiftly, "Get us to the king!"

Hope led us through the castle corridors, and up a flight of steps to the main floor. The rooms here were thronged with terrified people—crimson nobles in their bedraggled finery of the festival. In all the chaos no one seemed to notice us.

We mounted another staircase. We found a vacant room; through its windows we looked a moment, gazing into the garden. It was jammed with a

menacing mob, which milled about, leaderless, waving crude weapons, shouting imprecations at the palace. At the foot of the main steps the throng stood packed, but none dared to mount. A group of the palace guards stood on the platform over the moat.

Derek turned away impatiently. "Let's get to the king."

We mounted to the upper story. The castle occupants stared at Derek and me as we passed them. A group of girls at the head of the staircase fled before us.

"The king," Derek demanded, "Which is his apartment? Hurry, Hope, we've no time now!"

We found the frightened king seated on a couch with his counsellors around him. It was a small room in this top story of the castle, with long windows to the floor. I saw that they gave onto a balcony which overlooked the gardens. There were perhaps twenty or thirty people huddled in the room. A confusion existed here as everywhere else—no one knowing what to do in this crisis. And that cursed alarm bell

wildly adding to the turmoil. We paused at the doorway.

"Now," whispered Derek. He drew himself to his full height. His eyes were flashing. It was a Derek I had not seen before; he wore an air of mastery. As though he, and not the frightened, trembling monarch on the couch, were master here. And as I stared at him that instant in this primitive chaotic environment, the power of him swept me. A conqueror. The strange electrode clamped to his head gave him an aspect miraculous, awe inspiring.

He strode forward across the apartment. The king was just giving some futile, vague command to be transmitted to his guards down below. A hush fell over the room at our appearance. The king half stood up, then sank back.

"Why—why—who—"

I saw Rohbar here. His long crimson cloak hung from his shoulders, with its hood thrown back. Beneath it, as it parted in front, his leather uniform was visible. A

sword was strapped to his waist. He was striding back and forth with folded arms, frowning, but his gaze was very keen. Rohbar was not frightened. He seemed rather to be gauging the situation, pondering how he might turn it to his own ends. He stopped short and swung about to face us. His jaw dropped with surprise, amazement, at our strangeness.

Derek confronted him. His bulk, and huge weight towered even over Derek. The king gasped and sat helplessly staring.

Rohbar spoke first. "Who are you?"

"This mob must be dispersed. Don't stand looking at me like that, man!"

Derek spoke in friendly fashion, but vehemently. "This is no time for explanations."

They were menacing each other. Rohbar's heavy hand fell to his sword, but Derek boldly pushed him away. He faced the king.

"Your Majesty...."

The king stared blankly at him. The title was no doubt strange to this realm, but no stranger than Derek's aspect.

"Your Majesty...."

But the noise from the garden, the confusion which now broke out in the room, and that damnable clattering bell, drowned his words.

The king found his voice. "Be quiet, all of you!" He was on his feet. He demanded of Derek again, "Who are you?"

Derek said swiftly, "I'll show you. I can disperse this mob! Charlie, come."

It seemed as though the gaze of everyone in the room went to me. I drew myself up and flashed defiance back at them. And I followed Derek to one of the balcony windows. He went through it, with me after him. I stood at the threshold, watchful of the room

behind us. Rohbar was standing aside, and I saw now the woman Sensua with him. They were whispering, staring at me and Derek.

I had been wondering why, when Sensua must have known that the king would choose her—why she had dared to murder her rival. I thought now—as I saw her with Rohbar—that I could guess the reason. She loved Rohbar, not the king. Rohbar was plotting to put himself on the throne, using Sensua as a lover to that end. He had doubtless persuaded her to this murder, knowing it would arouse the toilers, precipitate this chaos which was what he wanted. Scheming scoundrel! I could not forget the look of desire on his face as he had accosted Hope....

And now Derek appeared, to add an unknown element to Rohbar's plans. There was no way he could guess who or what we were. I saw that he was puzzled, was whispering to Sensua about us, doubtless wondering how to handle us.

I saw too, that there were half a dozen crimson cloaked men here who were not frightened. They had

gathered in a group. They stood with hands upon their swords, eyeing me, and watching Rohbar—as though at a sign from him they would rush me.

On the balcony Derek stood with the light from the room upon him. The crowd saw him. The main gateway of the palace was just under his balcony. The crowd had now started up the steps to where the guards were standing at the top. At the sight of Derek the mob let out a roar, and those on the steps retreated down again.

Derek stood at the balcony rail, silent, with upraised arms, gazing down upon the menacing throng. There was a moment of startled silence as he appeared. Then the shout broke out louder than before. The crowd was milling and pushing, but still leaderless. An aimless activity. Someone threw a stone. It came hurtling up. It missed Derek and struck the castle wall, falling almost at my feet.

Derek did not move. He stood calmly gazing down; stood like an orator waiting for the confusion to die before he would speak.

From the platform, just beneath Derek, the guards were staring wonderingly up, awed, startled. To the right a wing of the building turned an angle. The castle tower was there: it rose perhaps a hundred feet higher than our balcony. On the railed platform-balcony girding its top I saw the figures of other guards standing, gazing down at Derek. The clanging bell up there was suddenly stilled.

I became aware of the king close behind me. His voice rang out: "What are you doing? How dare you?"

Derek whirled, "You fool! To what a pass you have come! Your people in arms against you...."

His violent words brought the king's anger. "How dare you! This is treason!"

I stood alert, with my hand upon my dirk.

There would be conflict here, I felt that we could not hold it off more than a moment longer. My mind leaped to that metal cylinder Derek had concealed. A weapon? Then why did he not have it out now? His

eyes were flashing. The aspect of power, of confidence, upon him was unmistakable. It heartened me. I took a step toward him.

He smiled faintly. "Wait, Charlie."

The king gasped again. "How dare you? Why, this is treason! Rohbar, seize him!"

Hope was beside me, her eyes watching the room. Rohbar came striding forward. Derek rasped, "You perhaps have some sense! Lead His Majesty away. Take care of him until this is over."

They stood with crossing glances. And upon Rohbar's face a look, queerly sinister, had come. A smile, sardonic.

He said abruptly to the king, "I think we should let him have his way. What harm?"

He gestured and Sensua came forward. The crimson murderess! Her voluptuous figure was shrouded in a crimson cloak. Her heavy painted lips smiled at the

King. Her rounded white arms went over his shoulders.

"Leonto, do as Rohbar says. Let this stranger try. It can do no harm."

The king yielded to her; I watched as she and Rohbar urged him through an archway that gave into the adjoining apartment.

No wonder Rohbar was sardonically smiling! Derek had played into his hand. We did not know it then, but we were soon to find it out.

Chapter 9: "Alexandre—"

Derek turned back to the balcony. It had been a brief interlude. The mob in the garden, the soldiers at the top of the stairway, and the other guards high on the bridge of the tower were all standing gazing. Shouts again arose as Derek appeared. Again he raised his arms. This time his voice rang out.

"Silence all of you! I am a friend! Silence!"

At first they did not heed him; then someone shouted:

"Quiet! Listen to him! Let him talk!"

The crowd was bellowing, and then they ceased. The bell was still. In the hush came Derek's voice:

"I am a friend. I come from foreign lands, from distant lands of strange people and strange magic."

For answer the crowd shouted and milled in confusion. A stone came up and then another. Derek stood immovable, like a statue gazing down at them.

"I command you to disperse. You will not? Then look at me! Look at me, all of you. My will is law beyond this king—beyond these palace soldiers—beyond any power you have ever known."

Then I knew a part of Derek's purpose! He had pressed the mechanism at his wrist. He stood imperious with upraised arms. The garden was in a tumult, but in a moment it died. A wave of horror swept the crowd. A freezing, incredulous horror. They

stood staring, incredulous, silent, swept with a widening wave of horror.

The figure of Derek on the balcony was fading, turning luminous. A wraith, a ghost of his menacing shape standing there. It faded until it was almost gone, and then, as he reversed the mechanism, it materialized again. A moment passed, then he stood again solid before them.

His voice rang out, "Will you obey me now? I am a friend of the toilers!"

They were prostrate before him. There is no fear more terrible than the fear of the supernatural. In all of history there has been in our world no worship more abject than the worship and fear of a primitive people for its supernatural God. On the platform beneath the balcony, the palace soldiers stared up, horrified. Then they too were prostrate before Derek's threatening gestures and commanding voice.

I stood watching, listening. And suddenly, from the prostrate crowd, a man leaped up. In the silence his

amazed voice carried over the garden.

"Alexandre! It is our Prince Alexandre! Our lost prince!"

He stood staring at Derek, his arms gesturing to his comrade around him. He shouted it again:

"Our rightful king, come back to us! Don't you recognize him? *I* saw him go! He went like that—fading into a ghost. Ten years ago, when Leonto killed his father and would have killed him had he not escaped!"

The crowd was standing up now. They recognized Derek! There was no doubt of it. The garden was ringing with the tumultuous shouts,

"Alexandre! Our lost prince has come back to us!"

My head was whirling with it. Derek, prince of this realm? I could see that it was true. Escaped from here as a young lad, when his throne was usurped. Returning now, a man, to claim his own.

And suddenly he turned and flashed me his smile.

The din from the garden drowned his words. The crowd was shouting: "Alexandre! Our lost prince!"

The king's guards on the lower platform stood sullen, confused. I heard footsteps behind me. I whirled around.

From the room, the group of Rohbar's crimson nobles were rushing toward me! Their swords were out. One of them shouted, "Kill them now! We must kill them and have done!"

There were five or six men in the group. They were no more than ten feet away from me. They came leaping.

I stood in the window opening, with only my dirk to oppose them. I shouted, "Derek! Derek!"

I think I took a step backward. I was out on the balcony. It flashed over me—Derek and I were caught out here!

The first of the red cloaked figures came hurtling through the doorway. I leaped to avoid his sword. I saw the others crowding behind him.

Then I felt Derek shove me violently aside. I half fell, but recovered myself at the balcony rail. Five of the crimson nobles were on the balcony. Derek confronted them. His aspect made them pause. They stood, with outstretched swords. The garden was silent; the crowd stared up. And in the silence Derek roared,

"Get back! All of you, go back inside! Back, or I'll kill you!"

In Derek's right hand he held the cylinder outstretched, leveled at the menacing nobles.

"Back, I say!"

But instead they rushed him. There was a flash. From the cylinder it seemed that a ray spat out, a flash of silver light. It caught the three men who were in advance of the others. Their swords dropped with a

clatter to the balcony floor. They stood, transfixed.

An instant. Derek's silver ray played upon them. Their red cloaks were painted with its silver sheen.

They were shimmering! I gasped, staring. The other nobles, beyond the ray, had fallen back. And they too stood staring in horror.

Another instant The three figures wavered. I saw the face of one of them, with the shock of incredulous horror still upon it. A face turning luminous! A face, erased, with only the staring eyes to mark where it had been!

There was a moment when the three stricken men stood like shimmering ghosts, with Derek's deadly ray upon them. Then they were gone! It seemed, just as they vanished, that they were falling through the balcony floor....

Derek snapped off his ray. He rasped, "Back into that room, I tell you!"

The remaining nobles fled before him. He turned again to the balcony rail.

"My people—yes, I am Alexandre—I had not thought you would recognize me so soon. But you are right—the time has come for me to claim my inheritance. And I will rule you justly."

His cylinder was still in his hand; he swept a watchful glance behind him. I thought of Rohbar. He was in the next room, with the king. Had they seen this attack upon Derek? They must have heard the crowd shouting, "Alexandre!" It seemed strange they did not appear.

I recall now, as I look back to this moment on the balcony, that I suddenly thought of Hope. She had been beside me just before the nobles attacked. I did not see her now. I was startled, but thought of her was driven from my mind. From within the palace a scream sounded. A girl screaming.

But it was not Hope's voice. A girl, screaming, and then shouting:

"The king is dead!"

Derek came rushing at me. "Charlie, that—"

We heard it again. "The king is dead!"

We hurried into the adjoining room. There was no one to stop us—no one up here now who dared oppose Derek. The terrified nobles in the room fell cringing before him.

"Alexandre—spare us! We are loyal to you!"

He strode past them. In the adjacent apartment we found the king lying upon the floor. A wound in his throat welled crimson. He had evidently been lying here alone, and had just now been found by a girl who had entered. He was not quite dead. Derek bent over him. He opened his eyes.

He gasped faintly: "Rohbar—killed me. Rohbar and that—accursed crimson Sensua...."

His voice trailed away. The light went out of his

staring eyes. Derek laid him gently back on the floor.

And as though already the news of his death had miraculously spread, the bell in the castle tower began tolling. Not clanging now. Tolling, with slow, solemn accent. The crowd evidently recognized it. We could hear the shouts: "Death! Death has come!"

Derek's eyes were blazing as he stood up. "The end, Charlie! I would not have planned this, and yet...."

He did not finish. He whirled, rushed back to the other room and to the balcony. The scene was again in confusion the crowd milling, voices shouting:

"The king is dead!"

At the edge of the garden a woman's shrill, hysterical laughter rose over the din.

Derek called, "Yes, the king is dead!" He paused. Then he added, "If you want me—if I have your loyalty—I will claim my throne."

A tumult interrupted him. "Alexandre! King Alexandre!"

He spread his arms, but he could not silence them.

"The king is dead. Long live King Alexandre!"

A wave of it swept over the garden, engulfing the castle. At the main entrance Leonto's soldiers stood sullen, listening to it.

Derek stood triumphant. His hands were outstretched, palms down. But up on the circular bridge at the top of the tower there was a sudden commotion. The soldiers up there had vanished, moved back within the tower to make room for other figures. I stared amazed, transfixed. A huge man in leather garments was there, with a sword stuck in his wide belt. A man with a bullet head, a heavy face, gazing down....

Rohbar!

And held in front of him the slender figure of a girl.

Hope! He clutched her, his thick arm encircling her breast. With sinking heart I realized what had happened. Hope had moved away from me. Every one in the room had been intent upon Derek. Rohbar had come quietly in, after murdering the king, had seized Hope, stifled her outcry, and had taken her up into the tower.

And I had promised Derek that I would shield this girl from harm! The horror of it—the self-condemnation of it—swept me, froze me to numbness. I could not think; I could only stand and stare. Rohbar held Hope like a shield before him. The low railing hardly reached her knees. A sheer drop to the garden beneath. He held her tightly, and in his free hand I saw his dirk come up menacingly against her white throat. His voice called:

"Silent, down there! Alexandre, you traitor! Silence!"

Derek stared up. The triumph faded from him. He stared, stricken. The crowd stared. The soldiers on the lower platform ceased their shouting and gazed up at these new actors, come so unexpectedly upon

the stage. Again Rohbar called, to the guards this time:

"I represent your King Leonto. This Alexandre is a traitor to us all. And he cannot harm me! I defy him. Look at him! I defy him to use his evil weapon upon me!"

Derek was silent. A single adverse move and Rohbar's knife would stab into Hope's throat. Derek's ray was powerless. A flash from it would have killed Hope, not Rohbar.

The king's soldiers saw Derek's indecision. One of them shouted, "He cannot harm us! Look, he is frightened!"

The crowd recognized Hope. They began calling her name. And calling, "Master Rohbar, do not harm our Hope!"

"I will not harm her! Not if you do what I tell you! Leave the garden—go quietly! I will deal with this traitor!"

He added to the guards, "Go up and seize him! He cannot hurt you! Traitor! Seize him! If he does not yield—if any of this crowd attacks you—then I will kill Hope."

Derek stood clinging to the balcony rail. With Rohbar's watchful gaze upon him he did not dare turn or move. I was standing back from the balcony, behind Derek and partly in the room. No one thought of me. No one from outside could see me. And I, who had played no part in this, save that one I had neglected, suddenly saw my role. My cue was sounding. My role to play, here upon this tumultuous stage.

I turned back into the dim room. A few frightened men and girls were here. They were all crowding forward, gazing through the windows at the scene outside. No one noticed me, but I saw, with sudden realization, my role to play.

I darted across the room, out into the dim, deserted corridor of the castle.

Chapter 10: My Role to Play

I slipped like a shadow through the almost empty corridors. Down on the lower floor I found that many of the soldiers were on the inside, standing about the corridors in groups, waiting for word from their comrades on the platform to indicate what action they should take. My time was short; I knew that within a few minutes they would be rushing up to overpower Derek.

I stood unseen against the wall near the main entrance. I could not get outside. There were too many soldiers there.

I tried to keep my sense of direction. The wing upon which the tower stood was about two hundred feet from me here. If I could not get outside I would have to try the inside, along this corridor. I prayed that I might not make an error. I tried to gauge exactly where the tower would be.

The hallway was almost dark and in this wing there chanced to be no one at the moment. I came to the

angle and turned it to the left. I was unarmed save my dirk. I drew it. But I encountered no one. I passed the doors of many empty rooms. The windows were all barred on this lower floor. I could hear the shouts of the crowd outside.

I came at last to the end of the wing. A staircase here led upward. I guessed that I was directly under the tower now, and that this staircase undoubtedly led upward into it. I mounted a few steps to verify what I was sure would be the condition. It was as I thought. Rohbar had won over the soldiers who were here. He had sent them down from the tower bridge. They were guarding this staircase.

I crept up another few steps, very cautiously. I could hear their voices on the stairs. A light was up there. I could see the legs of some of them as they crowded the stairs. I softly retreated.

There was no way of getting up into the tower here. Alone and armed only with my dirk, I could not mount these stairs and assail a dozen armed men standing above me; especially when, if I raised an alarm,

Rohbar overhead might be startled into killing Hope.

I stood another moment, thinking, planning my actions. I was trembling. Everything depended upon me now. I must get up into the tower. And, above everything, haste was necessary.

I retreated back to the lower floor. I was still some twenty feet above the ground, I judged. That was too far. A dozen paces along the hall I saw a stairway leading downward into the ground level cellar of the castle. I marked in my mind exactly in which direction I turned, and how far. I went down the stairs.

There was an empty lower room. It was pitch black. I lay down on its earthen floor. Above me, a few paces off to one side I could visualize the tower. A hundred and fifty feet above me, at least, up to that bridge balcony, where Rohbar stood with Hope. I kept my mind on it and prayed that I might not be making an error, a miscalculation.

I prayed, too, that luck would be with me. A desperate chance, yet I thought I knew what was here, or about

here, in New York City. I lay on my side, alone in the blackness, and pressed the switch at my wrist....

The familiar sensation of the transition began. The darkness grew luminous. Around me shadows were taking form. My body was humming, thrilling with the vibrations within it. I could feel the ground under me seeming to melt. My head was reeling. Nausea swept me, but with it all I tried to keep my wits. I must watch this new Space into which I was going. Space? I prayed that here on this spot in New York City there would be empty space! If not, at the first warning, I was prepared to stop my mechanism.

The shadows grew around me. There was a moment or two when I felt as though I were floating. Weightless. The sense of my body hovering in a void, intangible, imponderable, with only my struggling mentality holding it together....

And then I felt myself materializing. Around me walls were taking form. I floated down a foot or two and came to rest upon a new floor. My hand brushed it. My physical senses were returning. I could feel a floor

of concrete. A vague, shimmering light was near me. It seemed to outline the rectangle of a window. All around was darkness. Empty darkness. Soundless, with only the throbbing hum of the mechanism....

I was indoors, in a room. I felt suddenly almost normal, except for the whirring vibration. I flung the switch again. There was a shock. A whirling of my senses. Then I sat up; my head steadied. The nausea passed.

I was back in my own world, in New York City. This was night: I tried to calculate the time. Derek and I had departed about midnight. This would be, then some time before dawn. I was in a cellar room, lying on its cement floor. There was a window, with a faint light outside it. A window up near the ceiling. A straggling illumination showed me a bin, a few barrels, a door leading into another room which looked as though it might be a machine shop.

I sat up, calculating. I was a thousand feet perhaps from the Battery wall, two hundred feet from the Hudson River. This was an office building, and I was

in one of its cellar rooms, at the ground level.

Near dawn? I tried to calculate what might be overhead. A deserted office building. Too early yet for the scrub-women. The elevator would not be running. I laughed to myself. Of what use to me an elevator, if it had been running? How could I, a midnight prowler, appear from the cellar of this building, and demand to be taken upstairs! There would be no elevator, but there would be watchmen. I would avoid them.

I found a door. My heart leaped with a sudden fear that it would be locked, but it was not. I went through it into a passage and found the staircase. I made two turns. I tried again to keep my mind on this Space here. I stood, carefully thinking. I had it clear. I had made no move without careful thought. The tower with Rohbar was still to my left, and about directly above me.

I went up the short stone staircase, opened another door carefully. I was in the dim lower hall of the office building. I found myself beside the deserted elevator shaft. A light was burning on the night attendant's

table in an alcove, on the other side of the shaft. He sat there with his back to me. I closed the door soundlessly.

The stairway upward beside the elevator was here. I watched my chance. I darted around the angle and went up. I met no one. The concrete staircase had a light at each floor. Four floors up. No, not enough! I opened the fourth floor door. The marble hall of the office building was empty and silent. Rows of locked office doors with their gold-leaf names and numbers. A single dim light to illumine the silent emptiness....

I retreated into the staircase shaft and mounted higher. My dirk was in my hand. Charlie Wilson, the Wall Street brokerage clerk, prowling here! And upon what a strange adventure!

I came to what I thought was the proper floor. In the hall I selected a room. The door was securely locked. I had no way of breaking the lock, but the panel was of opaque glass. I would have to chance the noise. I rushed the length of the hall, to where a red fire-ax hung in a bracket. I came back with it. I smashed the

glass panel of the door.

Would a watchman hear me? I did not wait to find out. With the ax I scraped away the splinters of glass. I climbed through the opening. My hand was cut, but I did not heed it.

I was in a dim, silent office, with rugs on the floor, desks standing about, filing cases, a water-cooler, and a safe in the corner. I rushed to one of the windows. It looked over Battery Park and the upper bay. The stars were shining, but to the east over Brooklyn I could see them paling with the coming dawn. I gazed down to try and calculate my height. Yes, this would be about right. And my position. I could see the outline of the shore, the trees of Battery Park, the busy harbor, even at this hour before dawn, thronged with the moving lights of its boats.

I saw all this with my eyes, but with my mind I saw the wrecked, deserted pavilion, and the gardens of Leonto's castle. The threatening mob would be below me. The palace entrance would be here to my left, down in the street where those taxis were parked.

There was a commotion down there by the office building entrance. I know now what caused it, but at the time I did not notice. The wing of the castle was under me. This would be the tower. Its upper room, or the balcony, just about where I was standing. I prayed that it might be so. I seemed with my mind to see it all.

I lay down on the floor by the window. Out in the office building hallway I heard heavy footsteps come running. One of the night watchmen had evidently heard the glass crashed.

I laughed. I pressed the switch at my wrist....

Chapter 11: The Fight on the Tower Balcony

The sensations swept me again. The room faded. Whether the watchmen came in to see a ghost of me lying there on the floor I did not know, nor did I care. I whirled into the shadows. And came in a moment out of the black silence. The office room was gone. I seemed to have fallen or floated down—how far I do not know. A triumph swept me. I was lying on another

floor. I could see a doorway materializing. I was not upon the balcony as I had calculated, but within the tower room. New walls sprang around me.

[ID: A black and white illustration showing the protagonist starting to sit up from the floor, wearing a black business suit, looking ahead of him, with the background a combination of the castle tower, with the balcony visible through a doorway, and the office building, fading together, with a still partially transparent guard standing directly in front of the narrator, looking straight ahead, unable to see him yet. On the balcony, Rohbar stands, clutching Hope, a

knife raised in threat. Image description end.]

I did not heed it, this time, the sensation, of the transition. I was too alert to what new situation might come upon me. The tower room. I could see it. I could see its oval windows close at hand. The doorway to its balcony. Sounds flooded me, mingled with the humming within me. Familiar sounds. The crowd shouting. And a single voice—the voice of Rohbar. Vague and blurred, but as I materialized it became clearer.

I was suddenly aware that there was a man beside me. One of the palace soldiers. He saw me materialize. He leaped backward in horror. I flung my switch. I was on my feet, swaying, and then I leaped upon him. My dirk plunged downward into his chest.

The thing made me shudder. I reeled with the sickness of it, but as he fell I clung to the dirk and ripped it out of him. It was dripping with his blood.

I stood trembling. The small tower room had no other occupants. I turned toward the door. I could see a

patch of stars, paling with the coming dawn. I crouched in the small doorway which gave onto the balcony, staring, swiftly calculating. The scene had scarcely changed. But, some of the soldiers had left the entrance platform, gone, no doubt, into the castle on their way upstairs to seize Derek.

On this upper balcony, no more than ten feet before me, Rohbar still stood gripping Hope. She was in front of him. His back was to me. A sudden jump, and I could plunge my dagger into his back.

Rohbar was shouting, "King Leonto is dead. If you should want me to succeed him, I will take this girl Hope for my queen. You all love her...."

I was tense to spring. Then out in the balcony, to one side, I saw Sensua crouching. Her crimson robe fell away to bare her white limbs. Her hand fumbled in her robe. She had been Rohbar's dupe, and now she knew it. Her knife was in her hand. Frenzied with jealousy and rage she sprang upon Rohbar's back, trying to stab at Hope.

Perhaps he sensed her coming, heard her; or perhaps she was unskilful. Her knife only grazed Hope's shoulder. He released Hope. He roared. He turned and gripped his murderous assailant. A second or two while I stood watching. He caught Sensua's wrist, twisted the knife from it and plunged the knife into her breast. She sank with a scream at his feet, and as he straightened he saw me.

But I had leaped. I was upon him. His own knife had remained in Sensua's breast. As I raised mine in my leap, he caught at my wrist; twisted it, but I flung the knife away before he could get it. The knife fell over the balcony rail. The weight of my hurtling body flung him backward, but the rail caught him. His arms went around me. Powerful arms, crushing me. I gripped at his throat.

There was an instant when I thought that we would both topple over the railing. I felt Hope beside us. I heard her scream. We did not go over the rail, for Rohbar lurched and flung us back. We dropped to the balcony floor, rolling, locked together. He was far stronger and heavier than I. He came uppermost. He

lunged and broke my hold upon his throat, but I was agile: I squirmed from under him. I almost regained my feet. He got up on one knee. He was trying to draw his sword. Then again I bore into him, kicking and tearing. He roared like a bull. And ignoring my plucking fingers, my flailing fists, he lunged to his feet with me gripping again at his throat.

His huge height swung me off the ground. I was aware that he had drawn his sword, but I was too close for him to use it. He swayed drunkenly with my weight; he was confused. I felt the rail behind us. We lunged again into it. Again I heard Hope scream in terror, and saw her leap at us. Rohbar stooped, trying to clutch the low rail. His bending down brought my feet to the balcony floor. With a last despairing effort I shoved him backward. And as he toppled at the rail, I fought to break his hold upon me. I felt us going and then I felt Hope reach me. Her arms flung about my waist. Her hold tore me loose. Rohbar's huge body fell away....

For an instant Rohbar seemed balanced upon the rail; then he went over. He gave a last long, agonized

scream as he fell. I did not look down. I crouched by the rail. The crowd in the garden; Derek standing on the other balcony; the soldiers who now had appeared behind him—all were silent, and in the silence I heard the horrible thud of Rohbar's body as it struck....

I clung to Hope for an instant, and she shuddered against me. The scene broke again into chaos. I cast Hope away and leaped up. I stood at the balcony rail. My arms went up and gestured to Derek. Amazement was on his face, but he answered my gesture. Behind him the soldiers who had come to seize him were standing in a group, stricken at this new tragedy.

Derek swung on them. He was not powerless now!
"Away with you!"

His cylinder menaced them, and they fell back in terror before him.

He darted past them and disappeared into the castle.

I felt Hope plucking at me. "I want to talk to the people."

She stood beside me, leaning over the rail. Gentle little figure. Familiar figure to them all. Their beloved Hope. Her voice rang out clearly through the hush.

"My people, we all want our beloved Alexandre—he has come back to us. He is our rightful king."

"King Alexandre! Long live King Alexandre!"

Derek in a moment appeared behind us. "My God, Charlie, I can't understand—"

I told him how I had done it. He gripped me. "I'll never be able to repay you for this!"

I pushed him forward and he joined Hope at the rail. Held her, and her arms went around his neck as she returned his kisses. The crowd gaped, then cheered.

I shouted, "Hope will be your queen—The reign of the crimson nobles is at an end!"

The wild cheering of the people, in which now the castle guards were joining, surged up to mingle with

my words.

Chapter 12: One Tumultuous Night

I come now with very little more to record.

I returned to my own world. And Derek stayed in his. Each to his own; one may rail at this allotted portion—but he does not lightly give it up.

The scientists who have examined the mechanism with which I returned very naturally are skeptical of me. Derek feared a further communication between his world, and mine. He smiled his quiet smile.

"Your modern world is very aggressive, Charlie. I would not want to chance having my mechanism duplicated—a conquering army coming in here."

And so he adjusted the apparatus to carry me back and then go dead. I have wires and electrodes to show in support of my narrative. But since they will not operate I cannot blame my hearers for smiling in derision.

Yet there is some contributing evidence. Derek Mason has vanished. A watchman in an office building near Battery Park reports that at dawn of that June morning he heard splintering glass. He found the office door with its broken panel, and the ax lying on the hall floor. He even thinks he saw a ghost stretched out by the window. But he is laughed at for saying it.

And there is still another circumstance. If you will trouble to examine the newspaper files of that time, you will find an occurrence headed "Inexplicable Tragedy at Battery Park." You will read that near dawn that morning, the bodies of three men in crimson cloaks came hurtling down through the air and fell in the street near where several taxis were parked. Strange, unidentified men. Of extraordinary aspect. The flesh burned, perhaps. All three were dead; the bodies were mangled by falling some considerable height.

An inexplicable tragedy. Why should anyone believe that they were the three crimson nobles whom Derek attacked with his strange ray?

I am only Charles Wilson, clerk in a Wall Street brokerage office. If you met me, you would find me a very average, prosaic sort of fellow. You would never think that deeds of daring were in my line at all. Yet I have lived this one strange tumultuous night, and I shall always cherish the memory.

#04 The Stolen Mind, by M. L. Staley (full name unknown):

What would you do, if, like Quest, you were tricked, and your very mind and will stolen from your body?

Aproximate word count: 9,700

Bigotry:

- - -

"What caused you to answer our advertisement?"

Owen Quest felt the steel of the quick gray eyes that jabbed like gimlets across the office table.

"Why does any man apply for a job?" he bristled.

Keane Clason gave an impatient smile.

"Come!" he said. "I'm not trying to snare you. But there were unusual features to my ad, and they were put there to attract an unusual type of man. To judge

your qualifications, I must know just why this proposition appeals to you."

"I can tell you that," nodded Quest, "but there's nothing unusual about it. In the first place, I knew that the Clason Research Corporation is the leading concern of its kind in the country. In the second place, this seemed to offer a way to obtain a substantial sum of money quickly."

"Good," said Clason. "And you feel that you have all the necessary qualifications?"

"Decidedly. I am 24 years old, athletic, and of an earnest and determined nature. Moreover, I have no family ties, and I'm willing to run any reasonable risk in order to improve the condition of my fellow men."

Clason smiled his approval.

"You say you need money. How much immediately?"

Quest was unprepared for the question.

"A thousand dollars," he ventured.

Without hesitation Clason counted out ten one-hundred-dollar notes from his wallet and laid them on the table.

"There's your advance fee. You're ready to go to work immediately, I hope?"

"Certainly," stammered Quest.

Stunned by the swiftness of the transaction, he sat staring at the money that lay untouched before him.

To accept it would be like signing an unread contract. But he had asked for it; to refuse it was impossible. Even to delay about picking it up might arouse Clason's suspicion. Already the latter had turned away and was opening the door of a steel cabinet. Quest had one second in which to reach a decision.... He crammed the currency into his pocket.

With delicate care Clason set two objects on the table. One looked to Quest like a miniature broadcasting

tower or a mooring mast for lighter than air craft. The other was a circular vat of some black material, probably carbon. Within it a series of concentric tissues were suspended from metal rings, and in a trough outside ranged four stoppered flasks containing liquids of as many different colors.

"Look at these models carefully," said Clason. "They represent two of the most remarkable discoveries of all time. The one on your left is the most *destructive* weapon known to man. The other I consider the most *constructive* discovery in the history of science. It may even lead to an understanding of the nature of life, and of the future of the spirit after death.

"Both of these were developed by my brother Philip and me together—but we have disagreed about the use to which they shall be put.

"Philip"—the inventor dropped his voice to a whisper—"wants to sell the secret of the Death Projector—the tower, there—as an instrument of war. If I should permit him to do that, it might lead to the destruction of whole nations!"

"How?" demanded Quest "I've heard of a device called the Death Ray. Is this it?"

"No, no," said Clason contemptuously. "Even in a perfected state the Ray would be a child's toy compared to the Projector. This is based on our discovery that invisible light rays of a certain wavelength, if highly concentrated, destroy life—and our additional discovery that if these are synchronized with short radio waves the effect is absolutely devastating.

"We obtain the desired concentration of invisible light by using a tellurium current-filter under the influence of alternate flashes of red and blue light. The projector can literally blanket vast areas with death, up to a top range of at least five hundred miles.

"Just picture to yourself what this means! In a space of ten minutes two men can lay down a circle of destruction a thousand miles in diameter; or they can cut a swath five hundred miles long in any desired direction."

"Have you ever proved it?" demanded Quest skeptically.

"Yes, young man, we have," snapped Clason. "Right here in the laboratory—but on a minute scale, of course. However, there's no time to demonstrate now. The point is that my brother is determined to sell if he can obtain his price for the invention. He argues that instead of bringing disaster upon the world, this machine will forever discourage war by making it too terrible for any civilized nation to consider. In spite of my opposition he has opened negotiations with an ambitious Balkan power. He may actually close the sale at any moment!

"However," Clason drew a deep breath "you see this other device? Simple as it appears, it is the key to the whole situation. We can use it—you and I—to overcome Philip's will and prevent this unthinkable transaction. The two of us can do it. Alone I would be virtually helpless."

"Why not have the Projector confiscated or destroyed by our own Government?" suggested Quest. "That

seems to me the only safe and sure way out of the difficulty."

"You simply do not understand," frowned Clason impatiently. "Philip is selling the plans and descriptions of the machine, not the machine itself. Even if this model and the larger test machine that we have built were destroyed—even if I were willing to have Philip sent to Leavenworth for life—he could still sell the Projector.

"But this other invention, our Osmotic Liberator, makes it possible for me to gain control of Philip and actually *change his mind*, through the medium of an agent. I have hired you to act as my Agent, Quest, because I can see that you are a young man of unusual character and vitality. And by way of reward I can promise you both money and a brilliant future."

The inventor poised in a tense attitude on the edge of his chair as though his body were charged with electricity. His eyes seemed to dart out emanations that set Quest's blood to tingling. Then for a moment the latter lost consciousness of his physical self. It

was as though he had opened a door and found himself suddenly on the brink of a new and totally strange world. He dispelled this fancy by a quick effort of the will, for he knew that he had a delicate problem on his hands and that it must be solved within a very few minutes. However he proceeded, he must act without disloyalty to his Government, and at the same time without injustice to Keane Clason.

"Tell me," he said in a husky voice, "how do you intend to use me? I do not believe in Spiritualism. I would be a poor medium."

Clason gave a short laugh.

"You are not to be a medium in that sense at all. Spiritualism as practiced is just a blind sort of groping and hoping. Osmotic Liberation, on the other hand, is an exact and opposite physico-chemical science. Here—I will show you."

Into the outer cell of the Liberator he emptied the purple vial, and so on to the innermost, which he filled with a golden-green liquid like old Chartreuse.

"The separating membranes, you understand, are permeable by these complicated solutions. Each liquid has a different osmotic pressure and therefore should, under normal conditions, interchange with the others through the membranes until all pressures are equalized. I prevent such interchange, however, by maintaining an anti-electrolysis which retards ionization and thus builds up what might be called osmotic potential.

"Now if an Agent—yourself for instance—submerges himself in the central cell, at the same time maintaining a physical contact with his Control at the surface of the liquid, and if then the osmotic potential is suddenly released by throwing the electrolytic switch, the host of ions thus turned loose in the outer compartments make one grand rush for the center solution, which contains the cathode.

"Under these conditions your body becomes a sort of sixth cell, and your skin another membrane in the series. Properly speaking, however, you are not a part of the electrolytic circuit but are merely present in the action. Your body acts as a catalyser, hastening

the chemical action without itself being affected in any way. Physically you undergo no change whatever; but in some strange way which is, like life, beyond analysis, your mind flows out into the solution, while your unaltered body remains at the bottom of the tank in a state of suspended animation.

"If no Control is present, all that is needed to return your mind into your body is a throw of the electrolytic switch back to negative, whereupon you emerge from the tank exactly as you entered it. But with your Control present and in contact with your submerged body, your mind, instead of remaining suspended in the solution, flows instantly into his body and resides there subject to his will.

"This can not be done, however, unless the wills of Control and Agent have first been brought into accord. To accomplish that, we clasp hands"—Quest grasped Clason's extended hand—"and look steadily into each other's eyes.

"Now, it is well known that the vibrations of an individual's will are as distinctive as the sworls of his

finger-prints. What is not so well known is that the frequency of vibration in one person can be brought into accord with that in another.

"You consciously retract your will by concentrating your mind upon the thing which you know I wish to accomplish. Gradually while we continue in this position your vibrations speed up or slow down until they acquire exactly the same frequency as my own. We are then in accord, and when your mind is liberated in the tank it is in a state which admits absorption into my body. And it is subject to my will because you have purposely attuned it to my peculiar frequency. Immediately after the transfer there will be a brief conflict, due to the instinctive desire of your will to obtain the ascendancy. But of course mine will gain the upper hand at once, since both wills will be in my frequency."

Quest felt, rather than saw, a wall of alarm closing in on him. He tried to avert his eyes, to withdraw his hand from Clason's grasp. With a nostalgic pang in the pit of his stomach he suddenly realized that he could not do so. He had gone too far—farther than

any man in his position had a right to go. Having deliberately weakened his will, it seemed now to have deserted him entirely. A prickling sensation coursed up his spine, his extended arm went numb, his hand trembled violently.

"Splendid!" said Clason, suddenly releasing both eye and hand. "Just as I foresaw, you will be able to attune yourself to my vibration-frequency with hardly an effort. Now please remain seated; I'll be back in a moment."

For a second after the door closed, Quest remained slumped in his chair. Then he was on his feet, shaking himself like a wet dog to free himself from the spell under which he had fallen. Something about Clason attracted and at the same time repelled him, fraying his nerves like an irritant drug and confusing his mind at the moment when he needed the full alertness of every faculty.

Invisible light—disembodied minds—will vibrations! Nothing there to get hold of. Were these things real or imaginary? Was Keane Clason a great inventor, or a

madman? Would Philip prove to be a real or an imaginary scoundrel? Should he summon help, or go on alone?

Professional pride said: wait, don't be an alarmist! With his knuckles Quest tapped the table, half expecting it to melt under his fingers. The feeling and sound of the contact gave him a peculiar start. On the farther end of the table stood a letter-box—an invitation. From his pocket Quest snatched a slip of paper, and wrote:

6 stroke 4—9:45A—Hired. If no report in 48 hours, clamp down hard.

To address a stamped envelope and slip it in with the outgoing mail was the work of seconds. But he was none too quick. He had just dropped back into a lounging attitude when the door burst open and Clason flew into the room?

"We must act instantly," hissed the inventor. "Philip plans to close the transaction within a day."

In spite of himself, Quest jumped upright in his chair. Clason tapped him on the shoulder reassuringly.

"It's all right," he smiled, "I'm ready for him. We'll make our move this afternoon and beat him by eighteen hours.

"Let's see." He paused. "Oh! yes. I was about to explain to you that as soon as the will of the Agent enters the body of his Control, the latter can again transfer it into the body of still another person.

"Now you understand why I advertised for a man of exceptional character? As my Agent, I want you to enter the body of Philip, and your will must be strong enough to conquer his in the battle for mastery which will begin the instant you intrude into his body. You will still be under my control, but your will must be strong enough on its own merits to overcome his. I can direct you, but your strength must be your own. That's clear, isn't it?"

"I think so," said Quest slowly. "But what becomes of me after you have frustrated Philip's plot?"

"That's the easy part of the process," smiled Clason; "but naturally you feel some anxiety about it. I simply withdraw your will from Philip, return it to your own body, and pay you a reward of ten thousand dollars."

"You're sure you can?"

"Perfectly. I have merely to touch Philip's hand to recapture your will. Then I immerse myself in the tank with the switch at plus. The osmotic action will extract both wills momentarily from my body. But the presence of two bodies and two wills in the solution together forces a balance, and each will seeks out and enters its own body. Then you and I climb out of the tank exactly as we are this minute."

"If it weren't for my belief that anything is possible," Quest shook his head, "I'd say that your claims for this invention were ridiculous."

"And you couldn't be blamed," admitted Clason readily. "This toy of a model is hardly convincing. But come along with me and I'll show you how the Liberator looks in actual operation."

The office rug concealed a trap door which gave upon a spiral stair. Below, Clason unlocked another door and led the way through a narrow and tremendously long passage lighted at intervals by small electric bulbs. Presently another door yielded to the inventor's deft touch and closed behind them with a portentous chug. Here the darkness was so utter and intense that Quest imagined he could feel the weight of it on his shoulders. From the slope of the passageway and the muffled beat of machinery that had come to his ears on the way along, he guessed that he was below ground in some chamber at the rear of the factory.

He gave a low exclamation as Clason switched on the toplight. No wonder the darkness had seemed of almost supernatural quality! Even the hard white glare of the daylight arc was grisly. Its rays rebounded from the liquids of the great circular tank in a blinding dazzle of color, while the dull black walls and ceiling were so perfectly absorptive that beyond arm's length they became to all effects invisible. Even the ledge on which he stood—the shoulder of the vat

—gave Quest the feeling that to move would be to step off into a bottomless pit.

But Clason took his attention at once, pointing here and there in his quick, nervous way to indicate how faithfully the Liberator had been reproduced from the model. In all respects the arrangements were the same, with the addition that here a long plank like a spring-board extended out from a wall-mount as far as the central compartment of the tank, and that from its end a narrow ladder hung down to the surface of the Chartreuse liquid. A double-throw switch fixed to the wall above the base of the plank was evidently the source of electrolytic control.

"When you throw the switch to plus," said Clason, pointing to the chalk-marked sign above, "you produce the violent electrolytic action needed to bring about a liberation. All the rest of the time it should be closed at minus, in order to maintain the anti-action which I explained to you.

"Now let's rehearse, so that when the time for the real performance arrives we can be sure of running it

off without a hitch."

"All right, sir," nodded Quest, so dazed by the glittering light that he was hardly conscious of what he said.

"First," said Clason, running lightly up the steps to the plank, "you walk out to the end, like this, and start down the ladder. Then you lower yourself into the tank. The liquid is at body temperature; it's neither strongly acid nor caustic; it will cause you no injury or discomfort whatever.

"Meanwhile I keep in contact with your hand until the instant that you become submerged. Now your mind is in me, see?—ready for transfer into Philip, where it will act as my Agent. That's how simple it is! Come on up and we'll go through the motions."

Quest experienced a shiver as he mounted the bridge. Annoyed with himself, he shrugged the feeling off. There was no risk here. Moreover, it was a part of his daily work to take chances; he had done so a hundred times without hesitation. Now he moved all the more

quickly, as if to belie the squeamishness that possessed him in spite of himself.

Swinging past Clason on the plank, he lowered himself without a pause to the bottom rung of the ladder, while the inventor, hanging head down, maintained contact with him.

"No need to stay here," he said in sudden irritation. "I understand perfectly what I am to do."

"I'm testing my own acrobatic ability," grunted Clason amiably. "Just a minute now."

He wriggled as if trying to adjust himself to a better balance, but in reality to mask the motion of his free hand with which he reached up and pressed a button in the side of the plank. Instantly the structure, pivoting downward on its wall-socket, plunged Quest to his waist in the osmotic solution.

[Image description start: A black and white illustration, showing Owen inside the vat of liquid up to his waist, clinging to the ladder with one hand, with Clarson holding his other hand from above.

Image description end.]

"For God's sake get out of the way!" he shouted, trying to wrench his hand out of Clason's sinewy grip.

"Let go, I tell you!"

But Clason clung like a leech, his teeth gritted under the strain. Again the plank lurched downward, and with a violent splash Quest vanished below the surface.

Quick as a cat, Clason scrambled up the ladder and back to the base of the plank, where he erased and interchanged the chalk-marked signs with which he had misled Quest. Then with a sinister twist of a smile he threw the switch to minus, and turned to watch as the plank slowly righted itself and the vacant ladder came clear of the liquid.

For some time he stood staring at the gleaming colored rings of his dissociation-vat like some witch over her cauldron, his lips working, his hands clasping and unclasping like the tentacles of some sub-sea monster. Then, as if the spell had suddenly broken, he turned on his heel and switched off the light. As he hastened down the passageway toward his office, the airlock sucked the door against its jamb with an ominous whistle.

In a twinkling, as Quest's shackled spirit writhed in its new housing, he knew that he was in bondage to a scoundrel. Formless and voiceless, he still fought madly for the freedom which the instinct of ten thousand generations made necessary to him.

At the same time he was furious at himself for having been tricked like an innocent schoolboy. The plank socket, the button which had tripped the supporting spring, the fake rehearsal, the tuning of his will to that of Clason—step by step the whole cunning scheme unfolded itself to him now.

But what could be the purpose behind this villainy? Only one answer seemed possible. Keane must be the one bent on selling the Death Projector, Philip the one who wished to frustrate the fiendish transaction! And Quest of the Secret Service—he was to be the tool to force the sale.

With the soundless scream of rage Quest's will hurled itself against Keane's. The two met like infuriated bulls, and for an instant too brief to be pictured as a lapse of time they poised immovable. But two wills

can not exist on equal terms in a single body, and in this case the vibration of both was that of Clason. Quest had challenged the Master Will. He could do no more. It hurled him back, crushed him like foam, compressed him to the proportions of an atom in the background of his consciousness. So brief and unequal was the conflict that in the next breath Clason had all but forgotten the presence of the stolen will within him. When he was ready to use his Agent, that would be time enough to summon him!

Despite this suppression, Quest began to see dimly through strange eyes, and to hear vaguely with ears that were not his own. Feelers, tentacles, some intangible kind of conduits carried thought impulses to him from the Master Will. He received these impressions vividly, but those which he gave off in return were so weak, due to the subjection of his will, that Clason was entirely unconscious of any response. Quest was not enough of a scientist to be astonished at the ability of a disembodied mind to experience sense impressions in the body of another. He was only glad that the darkness and silence were growing less.

Very, very slowly he was awakening to a new kind of consciousness—the consciousness of another person's Self. He hated and loathed that Self, yet it was better than the awful blankness that had gone before.

Suddenly, as light grew brighter and sound more clear and definite, a new element entered—the element of hope. At first it was feeble: its only suggestion was that sometime, somehow, he might escape this prison. But it was like water to a parched plant. It caused his will to expand, to extend its feelers, to press up a little more bravely against the crushing pile of the Master Will.

Now another surprise sprang upon him. He was moving! That is, Clason's body was moving in some kind of a conveyance, which was threading its way through crowded streets. Stores, buildings, buses, people—Quest remembered them all distantly as things he had known thousands of years ago. The driver turned his head, and his profile seemed vaguely familiar.

Now a rush of foreign thoughts drowned out his own.

They were a sort of overflow from the mind of Clason. They thronged along the conduits that bound the two wills together, but only Quest was conscious of the movement.

Keane's mind was on his brother Philip: that much was particularly clear. And there was something about a telephone call. Yes, Keane had telephoned to the police, disguising his voice, refusing to divulge his name. He had said that a man by the name of Philip Clason was in trouble and had told them where to find him. Then the police had telephoned the factory, and Keane had pretended astonishment and alarm at the news. That's why he was here now—he was on the way to confer with the police. And he was chuckling—chuckling because he had fooled Quest and the police, and because now the hundred million dollars was almost in his grasp.

Cutting in close, the car turned a corner and drew up before one of a row of loft buildings in a section of the city which Quest failed to recognize. As Clason stepped to the sidewalk, Quest was more painfully aware than ever of his powerlessness to influence by

so much as the twitch of a muscle the behavior of this hostile body in which he had permitted himself to be trapped. In his weakness he felt himself shrinking, contracting almost to nothingness under the careless pressure of the Master Will.

Clason glanced casually at his watch, and three men converged toward him from as many directions. There was nothing to distinguish them from anyone else in the street, but along the conduits it came to Quest that they were detectives and that they were there by appointment with Keane Clason.

"What floor?" asked the latter, with an excitement which Quest felt instantly was pure pretense. "Are you sure they haven't spirited him away?"

"Don't worry," replied the leader of the detectives. "The alley and roof are covered. We'll take care of the rest ourselves."

On tiptoe they climbed three long flights of stairs in the half-light. Clason held back as if in fear. He was a good actor, and Quest felt the shrinking and

hesitation of his body as he crouched and slunk along in the wake of the detectives, pretending terror at what was about to happen, though he knew—and Quest knew he knew—that there would be no resistance up there—that Philip would be found alone exactly as he had been left by Keane's hired thugs.

On the top landing Burke, the leader, paused to count the doors from front to rear.

"This is it," he whispered to the bull-necked fellow just behind him.

The other nodded, and crouched back against the opposite wall while his companions placed themselves in position to cross-fire into the room the moment the door gave way.

Quest longed for the power to kick his hypocrite of a master as he still held back, cowering on the stairs, playing his fake to the limit. Then the door flew in with a splintering shriek under the charge of the human battering ram, and across it hurtled the other two detectives in a cloud of ancient dust.

"Here he is!" someone shouted.

"Phil! Phil!" Keane Clason's voice fairly quavered with sham emotion as he ran into the room and threw himself at a man tightly bound to an upholstered chair, which in turn was wedged in among other articles of stored furniture.

But Philip was too securely gagged to reply, and as Burke slashed the ropes from across his chest he dropped forward in a state of collapse. Stretched on a couch, he soon gave signs of response as a brisk massage began to restore the circulation to his cramped limbs. Suddenly he sat up and thrust his rescuers aside.

"What time is it?" he demanded with an air of alarm.

"One o'clock," replied Keane before anyone else could answer, patting his brother affectionately on the shoulder while within him Quest writhed with indignation. "By Jove! Phil, it's wonderful that we got to you in time. Really, how—you're not injured?"

"No," grunted Philip, "just lamed up. I'll be as fit as ever by to-morrow."

"If you feel equal to it," suggested Burke, "I wish you'd tell me briefly how you arrived here. Do you know the motive behind this affair? Did you recognize any of the body-snatchers?"

Philip frowned and shook his head.

"Yesterday noon," he said slowly, "I took the eight-passenger Airline Express to Cleveland on business. There were three other passengers in the cabin—two men and a woman. Right away I got out a correspondence file and was running over some letters. The next thing I knew I was approaching the ground in the strangest state of mind I ever experienced. My head was splitting, and everything looked unreal to me. Seemed as if I was coming down on some new planet."

"You mean the ship was gliding down to land?"

"No, no. I was dangling from a parachute.... By the

way, where am I now?"

"In a Munson Avenue loft."

"In Chicago?"

Burke nodded.

"I guessed as much," frowned Philip. "You see, I came down in a field, and then before I could free myself from my trappings I was pounced on—trussed up and blindfolded—by a gang of men. I knew they had taken me a long distance by automobile, but I saw nothing more until they tore the blindfold from my eyes when they left me here."

"And they were all strangers to you?"

"Yes—those that I saw."

"Isn't this enough for just now, Burke?" interrupted Keane, and Quest received an impression of uneasiness that was not apparent in the inventor's tone. "After a good rest he's sure to recall things that

escape him now."

"Just one minute," nodded the detective, turning back to Philip. "Can you think of no plausible reason for this attack? Is there no one who might possibly benefit by putting you temporarily out of the way?"

Philip gave a frightened start. Then he was on his feet, clutching at his brother's arm.

"Keane!" he pleaded, "Keane! What's happened? I know, I know! It's the Projector."

"Water!" roared Keane, and Quest felt the panic that coursed through him as he tried to drown out his brother. "Somebody bring water! He needs it!"

At the same time he snatched up Philip's hand in a grip of steel. Instantly the latter's wild eyes became calm, the flush passed from his relaxing face, and he slumped down weakly on the couch.

In that fleeting moment Quest surged into the body of Philip and confronted his will with a fierce and

triumphant ardor. For now his will would have command of a body with which to fight his fiend of a Control.

With a sensation of contempt he met Philip's resistance and buffeted him ruthlessly backward, crushed down and compressed his feebly struggling will. And as Philip yielded, Quest felt his own will expanding to normal, taking possession of the borrowed body with hungry greed, and flashing from its faded eyes the spark of youth.

Burke stared in amazement at the kaleidoscopic rapidity of the changes in the rescued man's expression. Strange lights and shadows continued to flit across Philip's face as Quest's invasion of him proceeded, but with a diminishing frequency which soon assured Keane that his Agent was tightening his command.

The younger of Burke's aides stood fascinated, his mouth agape. The other spoke guardedly to his superior:

"Dope, eh!"

"Nah!" replied Burke, shrugging himself out of his trance. "Shock."

The actual duration of the conflict in Philip was something less than three seconds. It would have been more brief if Quest had exerted himself to the utmost. But his sensations as he first surged into this new habitat under Keane's propulsion were so weird and unearthly that for the moment he was lost in the wonder of the experience. For that short time, therefore, Philip was able to fight back against the onrush of the invading will.

In the next second Quest became conscious of the resistance. Urged on by his Control, he must push Philip back and quell him; but his sympathy for his opponent and his hatred of Keane roused him to sudden revolt. He wanted to disobey the Master Will, retreat, leave Philip in command of himself. But he could only go on, unwillingly thrusting back Philip's will despite the indescribable torment and confusion in his own. Then, with the feeling that he was ten

times worse than the most inhuman ghoul, he took full possession of his borrowed body.

"I'll take him home now," said Keane composedly to Burke. "As you see, he needs a little extra sleep. Meanwhile, if you have any occasion to call me, I will be at the factory."

To the youthful mind of the Agent, used to the lightness of an athletic physique, the body in which it moved down the stairs to the limousine seemed strangely heavy and awkward.

"I'm badly done up, Keane," he said with Philip's lips as the car got under way.

"Bah!" snorted Keane, "you've had a scare, that's all. Go to bed when you get home and sleep till nine this evening. At ten a man named Dr. Nukharin will call for you. He will drive you to a garage, leave the car, and transfer to another one a few blocks away.

"Out near Marbleton you will find an airplane staked in an open field. Nukharin is a capable pilot. He will

fly back southeast along the lakeshore to the meeting place. You should arrive about twelve-thirty. The test is set for one o'clock."

Quest listened in a state of abject rage. Lacking the power to resist his Control, he could only boil away in Philip's body like a wild creature hemmed in by bars of steel.

"Bring with you," continued Keane venomously, "the set of papers that you took from the safe in my office. Hold the other set in readiness to deliver to Nukharin to-morrow, after he has studied the results of the test and has notified Paris to release a hundred million dollars in cash for delivery at your Loop office at 3 p. m."

The murderous greed of the man maddened Quest. He tried to revolt, his will squirming like a physical thing, threshing the ether like a wounded shark in the sea. For a moment he felt that he was about to burst the bonds that his demon of a Control had woven around him. So violently did he resist that the immured and sporelike will of Philip forged up fitfully

out of the blackness and joined his in the hopeless struggle. But along the attenuated conduits that still chained Quest to the Master Will Keane caught the impulse of the mutiny, and his eyes darted flame as he countered with a will-shock that paralyzed his unruly Agent.

"Listen! you whimpering dog," he snarled. "Think as I tell you—and nothing more! You are going to apologize to Dr. Nukharin for your previous unwillingness to sell the Projector. You are going to tell him that I am at fault—that I held out—but that you found a way to force my compliance. You understand?"

Quest could find no words. With Philip's head he nodded meekly. Just then the car stopped and the chauffeur threw open the door.

Dr. Nukharin flew high despite the masses of cumulus cloud which frequently reduced visibility to zero. He had merely to follow the rim of the lake to his destination, and an occasional glimpse of the water was sufficient to hold him on his course.

In the back seat hunched Philip, his body crumbling under the weight of Quest's despair. For hours the latter had gone on vaguely, hoping somehow to thwart this horrible transaction that was rushing the world to its doom, thinking he might grow strong enough to wrench himself free and so liberate Philip from the dominance of his conscienceless brother. Even though such a move should leave his own will forever separate from his body, he was ready and anxious to make the sacrifice.

Suddenly the crash of the motor ceased and Nukharin banked the ship up in a spiral glide. Quest had never been in the air before, and the long whirl down into the darkness on this devil's errand was to him as eery as a ride to perdition in a white-hot projectile.

His mind seemed to trail out in a great nebular helix behind the descending ship. He felt that he had suddenly crossed some cosmic meridian into a new plane of existence, where he was changed to a gas, yet continued capable of thought. But even here his obsession remained the same. Keane Clason—trickster, traitor, arch-criminal—must be destroyed!

"I'll get him!" vowed Quest in words that were no less real for being soundless. "I'll trail him to the end of space and bring him to account!"

Then wheels touched earth and the cold, bare facts of his destiny rushed in on him with redoubled force. He felt the nearness of his Control seconds before he perceived him through the eyes of Philip. With a sensation like a stab he realized that now he must speak, play his part, be any bloodless hypocrite that Keane Clason chose to make him. The silent order surged down the conduits promptly enough; he responded as an automaton obeys the pressure of a button.

"Well, Doctor," chuckled Philip with a cunning leer, "here's the magic tower, just as I promised you. We'll run it up in a jiffy. This test is going to be so vivid and conclusive that not even a hard-headed skeptic like you can raise a question."

"You misunderstand me," returned Nukharin in an injured tone. "So far as I am concerned this procedure is only a formality, but it is none the less

necessary. Suppose that I should spend a hundred million of my government's money and the purchase prove worthless? You may guess that my folly would cost me dear."

Keane Clason was waiting on the platform of a giant truck, the motor of which was idling. All the apparatus was in readiness except that the three demountable sections of the tower had yet to be run up into position.

"One of the beauties of the D. P.," said Philip gleefully to the Doctor, while Keane smiled slyly to himself, "is that this pint-size dynamo provides all the current needed for the test. We pick the power for our radio right out of the air by means of a wave trap and mensurator invented by this bright little brother of mine," and he clapped Keane patronizingly on the back.

"Yes, ah—Dr. Nukharin," ventured Keane timidly, and at that moment Quest experienced the raging red hatred that causes men to murder. "Philip has promised me that you will employ this device only as

a threat to hold the ambitions of the larger powers in check."

"Of course, of course!" replied the Doctor heartily.

"But now let's have the test. Even at night I'm not too fond of these open-air performances."

The height of the tower as they ran the upper sections into place was forty feet. When all connections had been inspected, first by Keane, then by Philip, the former led Nukharin aloft.

As the climax of his plot approached, Keane's excitement bordered on a cataleptic state, hints of which came confusedly through the conduits to Quest. With a peculiar satisfaction he felt that Keane was suffering. The inventor's jaws became rigid, as though his blood had changed to liquid air and frozen him, and he had difficulty in controlling the movements of his arms.

Now he was afraid! Genuinely afraid, this time. Quest caught the impulse too clearly to doubt its meaning. This was no sham! Keane was doubting his own

machine, fearing that in the crisis some element in the finely calculated mechanism might fail to operate, thus cheating him of the blood-money on which his heart was set. Then he was speaking, and even Nukharin noticed the tremor in his voice:

"These nine tubes, which look like a row of gun barrels, are molded from silicon paste. Each shoots a beam of invisible light and a radio dart of precisely the same wave length. The destructive effect depends chiefly upon this exactness of synchronization."

"A question occurs to me," said the Doctor: "will others be able to manipulate the machine as successfully as you can?"

"It's fool-proof," chattered Keane, almost losing control of his voice, "absolutely fool-proof. Surely you have scientists in your country who can follow written directions! Nothing more is necessary."

"Very well," shrugged Nukharin. "I only want to be sure that no unforeseen difficulties may arise in an emergency."

"See this range-setter?" continued Keane. "The thread on the vertical shaft enables us not only to limit the range by angling the beams into the ground, but it can also be disengaged and the Projector revolved in a flat circle for maximum ranges."

"And is there no danger of the machine going wrong—of destroying itself and us?" suggested Nukharin.

"None whatever, Doctor. There is no explosive force and no great electrical voltage involved. As long as we stand back of the muzzles we have nothing to fear.

"Now look. I have set the micrometer at three hundred yards, which will just about cover the stretch between ourselves and the lake. I will cut a swath for you—and every bush, every blade of grass, every insect in this swath will be withered to ash in the twinkling of an eye. The destruction will be absolute."

"Please proceed," said Nukharin grimly.

Keane pulled a lever in its slot, then pressed it down into its lock as his projection battery swung lakeward

at the desired angle. Then with one hand poised on another lever, he pressed an electric button.

At the controls below, a bulb flashed on and off. The signal was superfluous, for already Quest had received his silent command from the Master Will. An icy dread fastened on him. He must obey the unspoken command; he had no will of his own with which to resist. The test would be a success; the Projector would be sold; the world would be turned into a shambles. And he, Owen Quest, would be the destroyer, the murderer, the weak fool who made this horror possible.

All this flashed through the Agent's mind in the fraction of a second that it took him to extend Philip's hand, close the switch of the dynamo, and snap on the alternating lights in the housing over the tellurium filter.

For an interminable five seconds he waited, in a ferment of revolt which the paralysis of his will made it impossible to put into action. Then again the command pulsed within him, the signal bulb flashed,

and he reversed his motions of the moment before.

Cold sweat cascaded down Philip's face as Quest felt the ladder vibrating under descending feet. He longed for the power to hurl Keane Clason to the ground and turn the Projector upon him. But with an awful irony the Master Will forced him to his feet, and to speak in a tone that withered the manhood within him.

"Come," said Philip in a triumphant tone to Nukharin, "and I will show you that Clason inventions perform as well as they sound."

Flashlight in hand, he started toward the lake with Nukharin and his brother close behind him. Twenty paces, and the long meadow grass suddenly vanished from beneath their feet.

"See that!" whispered Philip excitedly, waving the light from side to side to show the forty-foot swath that stretched away before them. "Not a trace of life left, not a blade of grass—nothing but dust!"

The only response was a gurgling sound that issued

from Nukharin's throat.

"Look!" Quest formed the word with Philip's lips under the urge of the Master Will. "Here was a tall bush. What do you see now? Just a teaspoonful of ash. When you examine the remains by daylight, you will find that even the root has disintegrated to a depth of two feet."

"Enough of this," croaked Nukharin in horror. "The deal is closed."

His face was convulsed with fear. Without another word he whirled about and fled toward his airplane. Philip gave a start as if to follow.

"Halt! you slob," growled Keane, whose composure had returned with the successful outcome of the test. "I have use for your company, even though you are as great a coward as our Slavic friend."

Coward! The epithet stung Quest like a flaming goad. One of the fine, intangible lines that bound him under the will of Keane Clason severed, and his own will

exploded into action like a thunderbolt. With startling agility he whirled Philip about, the flashlight clubbed in his hand. But Keane was quicker still. A clip on the wrist sent the weapon flying. Then Philip reeled backward from a kick in the stomach, and his clutching hands beat the air as he sank unconscious in the dust.

With a violent tug, Quest lifted Philip's body to a sitting posture. The phone was ringing, and by the pull on the will-fibers he knew that Keane was at the other end of the wire. Philip's body was failing under the strain of the part it was forced to play, and the blow of the night before had further weakened it. Now he sat rocking his head painfully between his hands. But Quest lifted him to his feet by sheer will, and he staggered across the room.

"Hello!", he said in a hoarse voice.

"Get the hell out here to the factory!" rasped Keane, and the crash of the receiver emphasized the command.

It was one o'clock as Philip whirled his sedan into Olmstead Avenue. At three, reflected Quest as the car scorched over the pavements, he must be at the downtown office to deliver the papers and receive the money.

Then he was face to face with Keane, reeling dizzily at the hatred that blazed from the latter's accusing eyes.

"Double-crossed me, eh!" The voice was a low snarl, and as he spoke Keane thumped the extra outspread on his desk. "But you're not going to get away with it—neither of you!"

Dismay, hope, dread, wonder robbed Quest of the power to speak. But he whirled around behind the desk with such unexpected violence that Keane staggered back in alarm. Then he was devouring the screaming headlines of the newspaper. Three seconds, like a slow exposure, and every word of the Record's great scoop was etched upon his mind as if with caustic:

DOOM LAUNCH ADRIFT ON LAKE

Physician Baffled by Condition of Five Bodies Found in Craft

Blighted Area on Shore Said to Have Bearing on Tragedy

THAW HARBOR, IND., June 6.—Five Chicago sportsmen, most of them prominent in business and society, perished in the early hours this morning while returning in the launch of A. Gaston Andrews from a weekend camping party near Hook Spit on the Michigan shore.

The boat was towed into this port at daybreak by the Interlake Tug Mordecai after being found adrift less than a mile off shore. According to Captain Goff of the Mordecai the death craft carried no lights and he barely avoided running her down. The weather along the Indiana shore was perfect throughout the night and there is nothing to indicate that the launch was in trouble at any time. The bodies are unmarked, and this little community is agog with rumors ranging all the way from murder and suicide to the supernatural.

Dr. J. M. Addis of Thaw Harbor, the first physician to examine the bodies, says that they appear to have suffered some violent electro-chemical action the nature of which cannot be determined at the moment. This statement is considered significant in view of the reported discovery ashore of a large blighted area almost directly opposite the point where the launch was found. Joseph Sleichert, a farmer who lives in that vicinity, reports that this patch of ground extending back from the lakeshore was completely stripped of vegetation overnight. He ascribes the damage to some unknown insect pest. Others say that the condition of the ground indicates that it has been burned at incinerator temperatures. Nothing is left of the soil but a blue powder.

Philip faced his brother with eyes that were dull with agony.

"You have made me a murderer!" Quest forced out the words in painful gasps.

But Keane snapped back at him like a rabid dog.

"You did it—you did it yourself! You tampered with the Projector. You tried to spoil the test. You changed the range. You tried to kill me, and instead you killed these others. And you're going to pay—both of you. You hear me?—you're going to pay!"

His voice mounted the scale to a scream. It was a wail of unreasoning terror, of the dread of exposure, of the fear that he would fail to collect the fortune now so nearly in his grasp. The accident that had jarred his well-laid plans had unnerved him.

Frantically Quest strove to answer him, to explain his utter subjection, as Agent, to say that if he had possessed the will to oppose or trick him he would have turned him over to the police, or might even have killed him, at the very outset. But in his frenzy, Keane had so tightened his control that Quest was speechless. Now he tried to substitute gesture for words, but Philip was rooted to the spot like a statue; even his hands were immovable.

He might have remained in this state indefinitely had not Keane's fears withdrawn his mind from his

immediate surroundings. Momentarily he forgot Quest, Philip—everything but himself and his predicament. And in the instant that his vigilance relaxed, Quest's enslaved will experienced a sudden lease of strength and hope. Independently of his Control, he found that he could move Philip's hand, could take a faltering step.

But now, what to do? How might he fan this feeble spark of volition to sufficient strength for decisive resistance? The idea came to him: if only he could place distance between himself and Keane, perhaps with one titanic effort he might launch himself against the Master Will, take him by surprise, crush him down, and reverse him to the status of Agent instead of Control.

With infinite effort Quest forced Philip's body step by step across the room. He must reach that window, get a signal of distress to someone in the street.

But Keane began to sense a mutiny. He followed. He crossed the floor with slinking, tigerish steps and snaking body. His wet lips writhed back over his

teeth, and his contorted features wove the leer of the abyss. Now as his Control drew physically near, Quest felt his mite of strength ebbing fast. Slowly Keane reached up with his clawed fingers and grasped his Agent by the arm.

"Remember!" he hissed, "if these deaths are traced to us, you break down—you confess—you take the blame—you paint me lily white—you describe the cowardly means by which you moulded me to your will—you plead only for a quick trial and the full penalty of the law. You understand?"

Quest made no reply, but he understood all too well the hideous intention of his betrayer. What a fool he had been to imagine that Keane Clason would ever restore him to his body! Philip to the chair, Quest a homeless spirit wandering in space, and for the body at the bottom of the tank, the brief regrets of the Department!

A sudden rushing sound filled the air with a sense of action and alarm.

Two—three—four speeding automobiles swung in recklessly to the curb and shrieked to a standstill under smoking brakes. Men leaped out and deployed on the run to surround the factory. Keane darted to the door and twisted the key.

"Come on!" he spat at Philip as he snatched back the rug and threw open the trap door.

The command galvanized Quest to action. In two bounds he had Philip on the stairs. A heavy impact rattled the office door just as he dropped the trap into place over his head. Then, infected with Keane's panic, he was running down the passageway like mad.

Inside the tank chamber the brilliantly colored rings of liquid flashed back the rays of the arclight. Half crazed with anxiety, Keane danced on the black ledge like a monkey on a griddle. His face was ashen, drool ran from his twisted mouth, his eyes were two black pools of terror.

Again Quest experienced the peculiar sensation which came with the slackening of control. New hope

sprang up in his agonized being as heavy blows boomed against the air-locked door. Great waves of fear poured along the conduits, betraying to the Agent the state of mind of his Control. Now what would Keane do? What could he do? Why, of all places, had he fled down into this blind burrow?

Thud, thud! Then came a series of sharp reports. Outside, they were trying to shoot away the deep-sunk disk hinges.

Still the door stood fast, but the fury of the assault on it whipped the faltering Keane to action. In a bound he was on the platform. With a lightning hand he threw the switch to plus, starting electrolytic action in the tank. Then he pressed a button concealed under the edge of the switch-mount and a panel slid silently aside in the wall, revealing a narrow outlet.

To Quest everything went a flaming red. He might have known that this fox would have something in reserve—a way of escape when danger threatened!

But his Control gave him no time for independent

thought. He forced Quest to turn Philip's eyes up to his own. Without disconnecting that grip of his glittering eyes, Keane leaped back to the ledge. Quest felt the silent order:

"Get up on that plank! Dive into the tank! Get back into your own body, let Philip have his! Then come up—the two of you—and face the music. For I'll be gone, and your story will sound like the ravings of a maniac."

Quest took an obedient step toward the platform. But at the same instant a tremendous crash shivered the door. It seemed to unnerve Keane Clason. With a gasp he sank down upon the steps, his body doubled in pain, his hand clutching at his heart. Another crash followed, and he shuddered and cried out.

Instantly Quest felt an expansion of the will. Keane's sudden physical weakness had loosened his control. Philip's lips worked painfully as Quest forced him to pause, to disobey the command of the Master Will. In a spasm of will he fought to wrench himself free from the countless clinging tentacles of his Control. In

great surges, Quest's reviving volition pounded against the walls of his borrowed body. Now he sought to force this sluggish body back to the wall, so that he might release the airlock and spring the door. But Philip seemed to ossify, every cord and muscle of his body frozen to stone by the conflict that raged within him.

Braced against the wall, Keane was rising slowly to his feet. His seizure was easing, and so he was able to exert a better pressure upon his rebellious Agent.

"Come!" he gasped, realizing that he lacked the strength to escape alone and must therefore change his plan. "Lift me—quick! Carry me out! Slide the panel back into place. We will escape together!"

The spoken command turned the balance against Quest. His will yielded to the master. At the same instant Philip's body relaxed like an object relieved of a great excess of electrical potential. Suddenly strong and supple, he lifted the trembling Keane and tossed him across his shoulder.

For a moment there had been a lull in the assault on the door. Now the battering resumed with a fury that jarred the whole chamber and sent ripples dancing across the varicolored liquids in the osmotic tank.

"Quick!" gasped Keane. "Move! I say. Carry me out."

But he was in a fainting condition. Crash after crash rocked the chamber, and with every blow Quest's will felt a stimulation that enabled him to stand off the commands of his Control. Then a wave of nausea swept over him and left him reeling. It seemed that Philip's blood had turned to boiling oil. A dazzling mist swallowed him up, and with a weird sense of inflation he felt full strength returning to his will.

A booming blow that bulged the door inward acted upon him like a stage player's cue. He leaped to the platform. The gurgling sound of remonstrance rattled from Keane's throat. But Quest paid no heed. Philip was walking the plank—away from the open panel—out over the tank.

Rapidly he dropped down the ladder to the bottom

rung, snatched Keane's wrist in a gorillalike grip, and hurled him down into the vat.

Then Philip was clinging desperately to the ladder, his strength gone, his body shivering as if with ague.

"Go on up!" came a strange, impatient voice from below him. "For heaven's sake let me out of here!"

A downward glance, and with a shout of alarm Philip was scrambling up the ladder, for there was a head down there, and a pair of naked shoulders, and the face of a man he had never seen before. Hand over hand Quest followed. Philip had collapsed and lay prone on the plank. Quest lifted him to his feet and shook him anxiously.

"Philip!" he urged. "Philip! Can you walk?"

The tattoo on the battered door helped to revive the older man.

"Quick!" whispered Quest, kneading Philip's arms.

"There's barely an hour left. Get to your office. Burn

the papers. Refuse the money. Do you hear me?"

Philip nodded dazedly.

"Hurry!" puffed Quest, thrusting him through the opening that Keane had reserved for his own escape, and sliding the panel back into place.

Quest was himself now—young, strong, free. Instantly he threw the electrolytic switch to minus. For Keane had failed to emerge from the tank, and since he was submerged alone, he could not escape until electrolysis was halted.

Just as Quest leaped from the platform to release the airlock, the door burst in and three men with drawn guns rushed into the chamber.

The leader stopped with a startled oath and stood blinking his unbelieving eyes. Quest was poised like a statue, his naked body gleaming an unearthly white against the lusterless black of the wall.

"Quest," came from the three in chorus. Then a rush

of questions: "What's the matter? What's happened to you? Where are the Clasons?"

Quest turned toward the platform, expecting to see Keane.

"Something's wrong!" he shouted. "Quick! Somebody get Philip. He's gone to his Loop office. Keane Clason's at the bottom of this tank. I'm not sure how this thing works, but Philip can get him out! I'm sure of it!"

Despite the confident predictions of both Quest and Philip Clason, osmotic association failed to restore Keane to life, and at last the coroner ordered the removal of the body. The autopsy revealed heart disease as the cause of his death.

For reasons best understood at Washington, the cause of the five launch deaths was withheld from the public. Quest's punishment for his part in the crime consisted of a promotion and a warm personal letter from the President of the United States.

#05 Compensation, by Charles Victor Tench:

Professor Wroxton Had Disappeared—But in the
Bottom of the Mysterious Crystal Cage Lay the
Diamond from His Ring!

Aproximate word count: 4,500

Bigotry:

Warnings:

- - -

"Why, John!" Involuntarily I halted at the entrance to my snug bachelor quarters as the flood of light my turning of the switch produced revealed a huddled figure slumped in an easy chair.

"Aye, sir, 'tis me." The man got to his feet, gnarled hands rubbing at his eyes. "An' 'tis all day that I've been waiting for you, sir. The caretaker said you'd be back soon so let me in. I must have fell asleep, an' no wonder, what with the strain an' no sleep or rest all last night."

"Strain? No rest?" I stared my bewilderment, trying at the same time to conceal the vague apprehensions occasioned by the fact that the trusted servitor of my friend, Professor Wroxton, should wait all day for me.

Hastily shedding my outer things, I bade him again be seated, sat down facing him, and asked him to explain.

"'Tis the professor, sir." The old chap peered at me with anxious, wrinkled eyes. "'Tis common enough for him to send me here on messages, sir, but to-day I've come on my own, because, sir," answering the question in my eyes, "I haven't seen sight of him since last night."

"Why—" I began.

"That's just it, sir." John took the words out of my mouth. "For twenty years my wife an' me have looked after the professor at The Grange. In all that time he's never been away at night. Whenever he had to come to town he'd tell us. Most times I'd drive him myself in the old car. But that was very seldom, sir, for

Professor Wroxton had few interests outside."

"But, John," I protested "is there no other reason for your agitation? He might have had an urgent call, or gone out for a walk or drive by himself."

"No, sir. If you'll pardon me, sir, you're wrong. The professor was fixed in his habits. He would not go away without tellin' me. Think back, sir, you know the professor as well as me. Better, because you are his friend and I am only a servant. Although, sir," this proudly, "he always treated me as a friend."

"Go on," I urged, seeing he was not finished.

"Well, sir, a few minutes back you asked me if there was no other reason for my being upset like. There is, sir. You know, sir, that for more'n twenty years the professor has led a retired sort of life; the life of a—a —"

"Recluse," I suggested.

"That's it, sir. He only left The Grange when he had

to. He was all wrapped up in some weird-like thing he was inventing. In all those years, sir, you were the only visitor who ever went into his laboratory, or stayed at The Grange for a night or more. That is, sir, until three days ago."

"Go on," I again urged, some of his perturbation communicating itself to me.

"The Grange, sir, lying as it does, fifteen miles from town an' back in its own grounds away from the road, isn't noted by many. When strangers do get into the grounds I usually gets 'em out again in short order. Three days ago, sir, a stranger drove up to the door in a fine car. He told me he was wantin' to purchase a country home. I told him The Grange was not for sale an' turned 'im away. He was turning his car to leave when my master came out. To my surprise, sir, he invited the stranger in. An' I'm sure, sir, because he looked so taken aback like, that the stranger had never seen the professor before."

"And after that?" I asked, now feeling decidedly uneasy.

"The stranger, sir—a Mr. Lathom he called himself—stayed on. He was in the study with the master last night. This morning there was no trace of either of them."

"But—good God, John!" I jerked to my feet, a fresh dread clutching at my heart. "What are you trying to get at? The professor and Mr. Lathom might possibly have driven away somewhere last night."

"Both cars, sir," the servant answered, "are in the garage. I bolt all the doors in the house myself every night. They were still fastened this morning. My wife an' me searched the house from cellar to garret an' hunted all over the grounds. We couldn't find a trace of the master or his guest."

"You mean to suggest then," I shot at him, "that two full grown men have completely vanished? It's absurd, John, absurd!"

I paced the floor thinking desperately for a few minutes, conscious of the ancient's anxious eyes. I half smiled. The thing was too ridiculous for anything.

Old John had grown morbid from living away from the outer world. Also, I had to admit that the atmosphere of The Grange, impregnated as it was with the lethal scientific dabblings of my friend, was exactly suited to the conjuring up of unhealthy forebodings in uneducated minds. I'd drive out to the home of my friend at once. No doubt I'd find him fit and well. He had refused to install a phone, so drive it had to be.

"John." I stopped my pacing and patted him on the shoulder. "I'm coming out to The Grange at once." His face showed his thankfulness. "I am sure," I went on as I struggled into my coat, "that we shall find the professor and his guest awaiting us. Anyway, it's time you got back to your wife and had some food."

"I hope to Heaven, sir, that you're right." With that we left the building and entered my car.

Although I had tried to dispel my fears, although I had tried to banter John out of his dread, I drove that evening as I had never driven before or since. Barely fifteen minutes later I halted my roadster at the short flight of steps leading to the main door of The Grange.

Even as we stepped from the machine the door flung open and an agitated woman hurried towards us. She was Mary, John's wife.

"Sir!" She gripped my arm and stared anxiously into my face. "'Tis glad I am that you've come. The Grange is a house of death."

In spite of myself a chill shook my whole body. Gently handing her to John, I strode up the steps.

At the open doorway I halted, the aged couple crowding on my heels, the woman still babbling about death. I couldn't blame her. All day she had been alone in that gloomy, rambling old building, wondering, no doubt, why John and I had not returned sooner.

And gloomy the house was. Always, even when staying there at the professor's request, I had found it to be somber and depressing, as if there lurked within its walls the shadowy wings of the years-old tragedy that had caused my friend to retire to such a God-forsaken place, and there become absorbed in his

scientific experiments.

Even now, as I gazed into the dimly-lighted hallway, the air seemed charged with that same malignant something I cannot describe.

Pulling myself together I strode quickly along the corridor, and flung open the study door. The lights being full on, one glance sufficed to show me that my friend was not there. Swinging on my heel, the horror I saw in the eyes of the servants, honest, healthy folks not easily frightened, conveyed itself to me. Somehow, the sight of that room, lights on, chairs drawn up to the burnt-out fire, brought home to me the fact that something serious was amiss. I chided myself for thinking John had been unduly agitated.

For a moment I stood, trying to conceal the chill coursing through my veins, puzzling what to do next. I decided to search the house thoroughly. If I found no sign of the professor or his guest, I would call in the police.

Fearfully yet willingly the aged couple led me from

room to room, from attic to basement, until but one place remained—the laboratory. I hesitated for several seconds at the closed door of my friend's workroom. Not that I had never entered the—to a layman's eyes—weirdly-appointed place. I had been in many times with the professor. But this time I dreaded what I might find.

Pulling myself together, I gently tried the door. To my horror it yielded to my touch. Alive, the professor always kept it locked. A new dread assailed me, as, flinging the door wide open, I blinked in the sudden glare of powerful globes. Someone had left the lights full on!

Horried I stood and stared, knowing by their heavy breathing that the aged couple were also staring with fright-widened eyes. Afraid of what? I did not know. I only knew that the atmosphere had become even more sinister. I knew that something dreadful had taken place in that room.

Trembling with consternation I forced myself to take a few steps forward, then I again stared about me. At

one end of the large room something shone brightly in the glow of the lights. Slowly I walked across to examine it: it appeared to be a glass case, almost like a show-case, about eight feet square and seven feet in height. With the mechanical actions of the mentally distraught I walked all around it. Not the slightest sign of an entrance could I see. The fact intrigued me. I tapped lightly on the highly polished surface with my fingers. It rang to my touch like cut glass.

Through the transparent surface I could see John and his wife. They were watching me furtively, wondering, no doubt, why I lingered. As I looked at them John suddenly lumbered up to the case on the opposite side. Dropping to his knees, he stared. Turning an imploring gaze to me, he pointed. His lips moved soundlessly. I followed the pointing finger with my eyes; gasped at what I saw.

Near the center of the cage, on the floor constructed of the same crystalline substance, something glittered, its brilliance almost dazzling as the light rays struck it. My face pressed close to the cold outer surface of the structure, my shocked intelligence

gradually realized what that small sparkling object was. It was a magnificent diamond—and the professor had always worn a diamond ring!

In a sudden frenzy of horror I pawed my way around the cage to where John still knelt. As I reached him he jerked his head in a numb way as he croaked, "It's a diamond, sir! The professor's!"

"But how?" I implored. "How can it be? There's no way into this thing. Perhaps he was working here, and the stone came loose from its setting. He couldn't have dropped it after the cage was completed."

"It's his diamond, sir," intoned the old man, dully. "I know it is."

Then a sudden unreasoning terror filled me. I shrank away from that shining box. It seemed to be mocking me, gloatingly, malevolently.

"Quickly!" I threw at the aged couple. "Let us get out of here! Now! At once!" They needed no second urging. I knew that they felt as I felt: the laboratory

was a sepulcher!

Five minutes later I was guiding my car over the narrow road to town. I did not pause until I drew up at police headquarters. I suppose my appearance was distraught, for I was ushered into the presence of the chief without delay. In a few moments I had poured out my story. He listened with a polite calmness I found almost maddening. Leaning back in his chair, he reviewed, audibly, the facts.

"Some twenty-odd years ago your friend, Professor Wroxton, married. He was so absorbed in the pursuit of some weird invention that he neglected his bride. She ran away with another man. This man deserted her, and disappeared. The professor found her many months later, in desperate health. Shortly afterwards she died. Your friend tried to trail the man, but failed. Shocked and saddened beyond measure, he retired to a place known as The Grange."

He suddenly straightened up in his seat, and pointed at me a thick forefinger.

"How long have you known Professor Wroxton?"

"About ten years," I answered.

"What was he trying to invent?"

"I don't know," I replied.

"And yet you had his confidence in other matters?"

"But what has all this to do with finding out what has become of my friend?" I blurted out. "Perhaps every moment counts."

"A lot." The chief eyed me in a way I did not like.

"Solely because your friend has not been seen by his servants for nearly twenty-four hours, merely because you saw what you believe to be his diamond in some kind of a glass compartment in his laboratory, you come here as distraught as a man who has something terrible on his mind. Why?"

"I can't say." I shifted uneasily under that direct stare.

"Somehow I *feel* that something dreadful has

happened to my friend."

"We do not go by *feelings*." The chief got to his feet. "But you have told me enough to warrant action. I want you to guide me and a couple of men to this house. Please wait here until I return." He left the room.

Sitting there awaiting his return, I tried to ponder the matter reasonably. After all, perhaps the chief was right. Merely because the professor had been absent for a few hours and I had seen what I thought to be his diamond in the laboratory, I had worked myself into a perfect fever of anxiety. I almost smiled to myself. In that businesslike office the whole affair did seem absurd. After all the professor did not have to answer to his servants for his actions.

Heavy footsteps, announcing the chief's return, caused me to rise to my feet. A few minutes later, in company with the three officers, I was driving again towards The Grange.

We made the return journey in almost complete

silence. Occasionally the chief would shoot a question at me; but, the night air cooling my fevered brain, my replies were guarded. He realized that fact, for I felt his eyes upon me all the way. What was going on behind that broad forehead, I wondered.

Then we reached The Grange. As we mounted the steps, John, his wife herding behind him, flung wide the door. He answered the question in my eyes with a negative shake of his head, and the words, "Nothing fresh, sir."

The chief eyed him keenly, then curtly bade him lead the way to the laboratory. John hung back, his face blanched. "I can't, sir," he faltered. The chief turned to me, and, although I wanted to follow John's example, although the atmosphere of the house had again filled me with an unshakable dread, I led the way, standing back at the door to allow the officers to enter first.

With calculating gaze the chief slowly took in every detail of the stone apartment. He turned to me.

"What is there here to be afraid of?" I pointed hesitatingly towards the crystalline cage. The chief and his men strode across to it.

"You don't know how to open this?" the chief shot at me after a brief examination.

"No," I replied. "It was not here on my last visit."

"When was that?"

"Some two or three months ago", I answered. "My work occasions much traveling on my part."

The chief and his men turned again to the cage, talking in undertones. He turned again to me.

"You notice that this thing is built in sections. One of them must be movable. Perhaps—" He paused as his eyes fell upon some wires and tubes that trailed across the floor from underneath the cage to a switchboard fastened to the wall.

"Perhaps," he repeated, "it is worked from that

board." He crossed over, stared thoughtfully at the shining levers for some seconds, and moved one slightly. The result was astounding. All four of us stared with unbelieving eyes as slowly, without the faintest sound, a section of one wall slid inwards, as if guided by invisible tracks on floor and ceiling.

"Guess that's enough for now." With the words the chief backed away, almost timidly, I thought, from the switchboard, and walked to the cage. For a moment he hesitated, but he entered, and emerged with the sparkling object in his hand.

"It's the professor's," I choked, crowding close to him.

"How'd you know?" he shot back. "All unset stones look pretty much alike."

"I just know," was all I could falter.

[ID: A black and white illustration showing the narrator standing with one of the police in front of the crystal box as the narrator gestures towards it. Image description end.]

"You 'just know'." The chief sat down on a stool and regarded me searchingly. "Mr. Thornton, when I started out with you, I thought I was on a wild goose chase or the trail of a confession. You looked exactly like a man who had either committed a serious crime,

or was getting over a bad drunk. I feel sure now"—he again regarded the diamond—"that your story was not the product of an alcohol-crazed brain. Come on!" He lurched to his feet, and grasped me by the shoulder. "Come through!"

Without answering, I wrenched myself free. Over my shoulder I saw one of the policemen at the door. In the hand of the other a revolver suddenly appeared. Good God! I glared in bewilderment from one to another. Was I going mad? Surely this was some awful nightmare! What had I said to make them suspect me of having committed a revolting crime?

"Sit down!" The command came from the chief. Mechanically I found a stool, and obeyed him. "Hold your stations, boys, and listen carefully," he ordered his men. Then he turned to me.

"Professor Wroxton was a wealthy man without kith or kin?"

"Yes."

"Do you know the nature of his will?"

"Yes." Chilled to the heart, I felt the circumstantial net tightening.

"What is its nature?"

"This house and an annuity to John and his wife," I explained. "The residue of his wealth to me."

"Humph!" The chief stared at me piercingly. "And how has business been with you lately?"

Damn the man! What right had he to put me through the third degree? I felt my state of dazed horror slowly giving way to anger. I glanced around. The pistol still menaced; the man at the door had not moved. It was useless to try and evade the questions.

"For the past year," I replied, "business has been very poor. In fact, the professor advanced me some money."

"Humph!" Again that irritating, non-committal grunt.

The chief turned in his seat and stared thoughtfully at the crystalline cage.

"And you don't know what the professor was trying to invent?"

"Only its nature," I began.

"Ah! That's better. Why didn't you tell me that before?" The chief leaned forward.

"Well," I explained, "the whole thing seems so absurd. When the professor told me how his married life had been broken up, he told me that at that time he reached the utmost depths of human suffering. Absolute zero, he called it."

"Ah!"

"The experiments he indulged in," I continued, trying to hide the shiver pimpling my flesh, "were to produce an actual state of absolute zero. It is years since he told me this. I had almost forgotten it."

"And exactly what is an absolute zero?" The chief's eyes never left mine.

"Well," I protested, "please understand that I also am a layman in these matters. According to my friend, an absolute zero has been the dream of scientists for ages. Once upon a time it was attained, but the secret became lost."

"And exactly what is an absolute zero?"

Curse the man! I could have struck him down for the chilling level of his tone. I forced myself to go on, realizing that I was damning myself at every step.

"An absolute zero is a cold so intense it will destroy flesh, bone and tissue. Remove them," my voice rose in spite of myself, "leaving absolutely no trace."

No trace! Something attracted my eyes. The chief had opened his hand. The diamond there flashed and sparkled as if mocking me. I pulled myself together, and went on.

"It all comes back to me now. One day I came out here and found the professor terribly distraught. He told me that, with the aid of electric currents he had been able to invent the absolute zero, but he could not invent a *container*."

"Why?" Those eyes continued to bore into mine.

"Because—remember it is years since he told me this—there was difficulty in controlling the power. Besides destroying living things, it would destroy bricks and mortar, stone and iron. Only one substance it could not wipe out—crystalline of diamond hardness.

"I know, now!" I jumped to my feet and grabbed the chief's arm. "I know now what he meant. Fool, fool! Why did I not think of it before? This—" I swung towards the cage—"is compensation." Almost panting in my eagerness I went on:

"My friend told me that the law of compensation would atone to him for the tragedy of his youth. Absolute zero in suffering would be atoned for by a

real state of absolute zero. Chief!" I whirled on him. "Don't you understand? This is the perfected dream of my friend. It is the absolute zero."

"Humph! Plausible but not convincing." I slumped back at the officer's words. "That does not explain the professor's disappearance. Even if it did, what about Mr. Lathom? And don't forget this contrivance is worked from outside. We found the diamond inside. Of course, he might have placed it there himself to test the machine," he concluded.

"Of course, that's it," I commenced. But I regretted the words when I saw suspicion flicker again in the chief's eyes. Lamely I finished, "And he has probably rushed off, in an ecstasy of triumph, to acquaint professional colleagues."

"Without unlocking any doors or taking a car, eh?"

"Mr. Thornton." The chief stood up and regarded me sternly. "As a sensible man, don't you think yourself that your story is a bit thin? The professor has disappeared. Here is a strange-looking case which

you say is an absolute zero container. Whether you know, or are just jumping at conclusions, remains to be proved. But even if it is, do you think that, after perfecting such a tremendous invention, the professor would commit suicide?"

"On the contrary," I gasped, "my friend was a man of gentle, kindly disposition, but strong purpose. I should think his first action on attaining his life's ambition would be to notify me, his closest friend."

"And he didn't." Every word condemned me, and roused me to retaliate.

"Chief, I know enough of the law to know that, before you can try a man for murder, you must prove that murder has been committed." I grinned savagely. "You must have the corpus delicti. Go ahead! Find my friend or his remains, or else withdraw your charges." I grinned again, with shocked mirthlessness.

Then I buried my head in my hands. I had called in the police to help find the professor, and they had only blundered around and asked a lot of stupid

questions. The chief had practically accused me of murder—something I knew he could not prove, yet feared he might. Because I had told the chief of the locked doors and unused cars, he had confined his investigations to the house itself.

He interrupted my thoughts.

"Mr. Thornton, I am going back to town. You will remain here with my men. I advise you to get some sleep, as I shall not be able to carry out certain investigations until the morning. One of my men will spend his time searching the house and patrolling the grounds, the other one will stay here with you."

He turned away, whispered some instructions to his men, and, followed by one of them, silently left the laboratory. I started to protest, tried to follow him; the man at the door stopped me. Silently, almost grimly, he indicated a narrow cot at one end of the room. For a moment I hesitated, feeling the man's eyes upon me.

Sleep on my dead—I felt sure he was dead—friend's

cot! Sleep in that fearful place! My whole being crawled with horror. I turned again to the man. His features were unyielding. Perhaps this was more third degree. Limp with weakness and weariness, I dragged my lagging feet towards the cot.

As long as I live I shall never forget my awakening. A uniformed figure, the chief, shaking me by the shoulder. Two other uniformed men silently watching. I sat up and gazed about me, dazedly. Bright sunlight streamed through the windows. A stray gleam struck the cage. I shrank back, trembling. And yet I had slept soundly.

"Mr. Thornton," the chief said, "I have serious news for you. I have positive proof your friend is dead."

"Dear God!" The exclamation was wrung from me as recollection returned with a rush. "Where? You can't have!"

"Here." He thrust a bundle of letters into my hands. "You acted so strangely last night you caused me to suspect you of a serious crime. Also, you overlooked

several important points. You got back from a trip only last night."

Last night! Surely it was years.

"You had left instructions to have your mail forwarded," the level voice went on. "These letters were evidently one day behind you. I picked them up at your rooms this morning. I took the liberty of opening them. Read this one." He selected it.

With trembling fingers I extracted from the envelope a single written page. I recognized the handwriting as the professor's. I read with feverish intensity, each single word burning itself into my consciousness:

Dear Thornton:

I am writing this in anticipation. I will see that it is mailed when my plans are completed. Too late, dear friend, for you to attempt, with the best intentions in the world, to frustrate them.

You will, perhaps, recall that many years ago,

when I gave you my full confidence, I told you that I felt sure that the law of compensation would atone in some measure for my loss. Thornton, old friend, I believe that, in more ways than one, my hour has arrived. Two days ago I completed the absolute zero. But even better!

A man called here to-day. Although he did not recognize me, I saw through the veneer of added years with ease. Fate, call it what you will, my visitor is the man who wrecked my happiness.

Under pretext I shall detain him. I shall induce him to enter the crystalline cage. I have already arranged a dual control which the power will destroy when I apply it from *the inside of the cage*.

Please destroy the cage. It will have brought compensation to me before you read this.

Good-by, dear friend!

Wroxton.

"I apologize, Mr. Thornton." The chief offered a hand which I clutched in mingled sorrow and relief. The world had lost a genius. I had lost a dear friend. But he was right. It was compensation.

#06 Tanks, By Murray Leinster:

Two miles of American front had gone dead. And on two lone infantrymen, lost in the menace of the fog-gas and the tanks, depended the outcome of the war of 1932.

Aproximate word count: 9,600

Bigotry:

Warnings:

- - -

The persistent, oily smell of fog-gas was everywhere, even in the little pill-box. Outside, all the world was blotted out by the thick gray mist that went rolling slowly across country with the breeze. The noises that came through it were curiously muted—fog-gas mutes all noises somewhat—but somewhere to the right artillery was pounding something with H E shell, and there were those little spitting under-current explosions that told of tanks in action. To the right

there was a distant rolling of machine-gun fire. In between was an utter, solemn silence.

Sergeant Coffee, disreputable to look at and disrespectful of mien, was sprawling over one of the gunners' seats and talking into a field telephone while mud dripped from him. Corporal Wallis, equally muddy and still more disreputable, was painstakingly manufacturing one complete cigarette from the pinched-out butts of four others. Both were rifle-infantry. Neither had any right or reason to be occupying a definitely machine-gun-section post. The fact that the machine-gun crew was all dead did not seem to make much difference to sector H.Q. at the other end of the telephone wire, judging from the questions that were being asked.

"I tell you," drawled Sergeant Coffee, "they're dead.... Yeah, all dead. Just as dead as when I told you the first time, maybe even deader.... Gas, o'course. I don't know what kind.... Yeh. They got their masks on."

He waited, looking speculatively at the cigarette Corporal Wallis had in manufacture. It began to look

imposing. Corporal Wallis regarded it affectionately. Sergeant Coffee put his hand over the mouthpiece, and looked intently at his companion.

"Gimme a drag o' that, Pete," he suggested. "I'll slip y' some butts in a minute."

Corporal Wallis nodded, and proceeded to light the cigarette with infinite artistry. He puffed delicately upon it, inhaled it with the care a man learns when he has just so much tobacco and never expects to get any more, and reluctantly handed it to Sergeant Coffee.

Sergeant Coffee emptied his lungs in a sigh of anticipation. He put the cigarette to his lips. It burned brightly as he drew upon it. Its tip became brighter and brighter until it was white-hot, and the paper crackled as the line of fire crept up the tube.

"Hey!" said Corporal Wallis in alarm.

Sergeant Coffee waved him aside, and his chest expanded to the fullest limit of his blouse. When his

lungs could hold no more he ceased to draw, grandly returned about one-fourth of the cigarette to Corporal Wallis, and blew out a cloud of smoke in small dribblets until he had to gasp for breath.

"When y' ain't got much time," said Sergeant Coffee amiably, "that's a quick smoke."

Corporal Wallis regarded the ruins of his cigarette with a woeful air.

"Hell!" said Corporal Wallis gloomily. But he smoked what was left.

"Yeah," said Sergeant Coffee suddenly, into the field telephone, "I'm still here, an' they're still dead.... Listen, Mr. Officer, I got me a black eye an' numerous contusions. Also my gas-mask is busted. I called y'up to do y' a favor. I aim to head for distant parts.... Hell's bells! Ain't there anybody else in the army—" He stopped, and resentment died out in wide-eyed amazement. "Yeh.... Yeh.... Yeh.... I gotcha, Loot. A'right, I'll see what I c'n do. Yeh.... Wish y'd see my insurance gets paid. Yeh."

He hung up, gloomily, and turned to Corporal Wallis.

"We' got to be heroes," he announced bitterly. "Sit out here in th' stinkin' fog an' wait for a tank t' come along an' wipe us out. We' the only listenin' post in two miles of front. That new gas o' theirs wiped out all the rest without report."

He surveyed the crumpled figures, which had been the original occupants of the pill-box. They wore the same uniform as himself and when he took the gas-mask off of one of them the man's face was strangely peaceful.

"Hell of a war," said Sergeant Coffee bitterly. "Here our gang gets wiped out by a helicopter. I ain't seen sunlight in a week, an' I got just four butts left. Lucky I started savin' 'em." He rummaged shrewdly. "This guy's got half a sack o' makin's. Say, that was Loot'n't Madison on the line, then. Transferred from our gang a coupla months back. They cut him in the line to listen in on me an' make sure I was who I said I was. He recognized my voice."

Corporal Wallis, after smoking to the last and ultimate puff, pinched out his cigarette and put the fragments of a butt back in his pocket.

"What we got to do?" he asked, watching as Sergeant Coffee divided the treasure-trove into two scrupulously exact portions.

"Nothin'," said Coffee bitterly, "except find out how this gang got wiped out, an' a few little things like that. Half th' front line is in th' air, the planes can't see anything, o'course, an' nobody dares cut th' fog-gas to look. He didn't say much, but he said for Gawd's sake find out somethin'."

Corporal Wallis gloated over one-fourth of a sack of tobacco and stowed it away.

"Th' infantry always gets th' dirty end of the stick," he said gloomily. "I'm goin' to roll me a whole one, pre-war, an' smoke it, presently."

"Hell yes," said Coffee. He examined his gas-mask from force of habit before stepping out into the fog

once more, then contemptuously threw it aside. "Gas-masks, hell! Ain't worth havin'. Come on."

Corporal Wallis followed as he emerged from the little round cone of the pill-box.

The gray mist that was fog-gas hung over everything. There was a definite breeze blowing, but the mist was so dense that it did not seem to move. It was far enough from the fog-flares for the last least trace of striation to have vanished. Fifteen miles to the north the fog-flares were placed, ranged by hundreds and by thousands, burning one after another as the fog service set them off, and sending out their incredible masses of thick gray vapor in long threads that spread out before the wind, coalesced, and made a smoke-screen to which the puny efforts of the last war—the war that was to make the world safe for democracy—were as nothing.

Here, fifteen miles down wind from the flares, it was possible to see clearly in a circle approximately five feet in diameter. At the edge of that circle outlines began to blur. At ten feet all shapes were the faintest

of bulks, the dimmest of outlines. At fifteen feet all was invisible, hidden behind a screen of mist.

"Cast around," said Coffee gloomily. "Maybe we'll find a shell, or tracks of a tank or somethin' that chucked the gas here."

It was rather ludicrous to go searching for anything in that mass of vapor. At three yards distance they could make each other out as dim outlines, no more. But it did not even occur to them to deplore the mist. The war which had already been christened, by the politicians at home, the last war, was always fought in a mist. Infantry could not stand against tanks, tanks could not live under aircraft-directed artillery fire—not when forty guns fired salvos for the aircraft to spot—and neither artillery nor aircraft could take any advantage of a victory which either, under special conditions, might win. The general staffs of both the United States and the prominent nation—let us say the Yellow Empire—at war with it had come to a single conclusion. Tanks or infantry were needed for the use of victories. Infantry could be destroyed by tanks. But tanks could be hidden from aerial spotters

by smoke-screens.

The result was fog-gas, which was being used by both sides in the most modern fashion when, their own unit wiped out and themselves wandering aimlessly in the general direction of the American rear, Sergeant Coffee and Corporal Wallis stumbled upon an American pill-box with its small garrison lying dead. For forty miles in one direction and perhaps thirty in the other, the vapor lay upon the earth. It was being blown by the wind, of course, but it was sufficiently heavier than air to cling to the ground level, and the industries of two nations were straining every nerve to supply the demands of their respective armies for its material.

The fog-bank was nowhere less than a hundred feet thick—a cloud of impalpable particles impenetrable to any eye or any camera, however shrewdly filtered. And under that mattress of pale opacity the tanks crawled heavily. They lurched and rumbled upon their deadly errands, uncouth and barbarous, listening for each other by a myriad of devices, locked in desperate, short-range conflict when they came upon

each other, and emitting clouds of deadly vapor, against which gas-masks were no protection, when they came upon opposing infantry.

The infantrymen, though, were few. Their principal purpose was the reporting of the approach or passage of tanks, and trenches were of no service to them. They occupied unarmed little listening-posts with field telephones, small wireless or ground buzzer sets for reporting the enemy before he overwhelmed them. They held small pill-boxes, fitted with anti-tank guns which sometimes—if rarely—managed to get home a shell, aimed largely by sound, before the tank rolled over gun and gunners alike.

And now Sergeant Coffee and Corporal Wallis groped about in that blinding mist. There had been two systems of listening-posts hidden in it, each of admittedly little fighting value, but each one deep and composed of an infinity of little pin-point posts where two or three men were stationed. The American posts, by their reports, had assured the command that all enemy tanks were on the other side of a certain definite line. Their own tanks, receiving recognition

signals, passed and repassed among them, prowling in quest of invaders. The enemy tanks crawled upon the same grisly patrol on their own side.

But two miles of the American front had suddenly gone silent. A hundred telephones had ceased to make reports along the line nearest the enemy. As Coffee and Wallis stumbled about the little pill-box, looking for some inkling of the way in which the original occupants of the small strong-point had been wiped out, the second line of observation-posts began to go dead.

Now one, now another abruptly ceased to communicate. Half a dozen were in actual conversation with their sector headquarters, and broke off between words. The wires remained intact. But in fifteen nerve-racking minutes a second hundred posts ceased to make reports and ceased to answer the inquiry-signal. G.H.Q. was demanding explanations in crisp accents that told the matter was being taken very seriously indeed. And then, as the officer in command of the second-line sector headquarters was explaining frenziedly that he was

doing all any man could do, he stopped short between two words and thereafter he, also, ceased to communicate.

Front-line sector headquarters seemed inexplicably to have escaped whatever fate had overtaken all its posts, but it could only report that they had apparently gone out of existence without warning. American tanks, prowling in the area that had gone dead, announced that no enemy tanks had been seen. G-81, stumbling on a pill-box no more than ten minutes after it had gone silent, offered to investigate. A member of her crew, in a gas-mask, stepped out of the port doorway. Immediately thereafter G-81's wireless reports stopped coming in.

The situation was clearly shown in the huge tank that had been built to serve as G.H.Q. That tank was seventy feet long, and lay hidden in the mist with a brood of other, smaller tanks clustered near it, from each of which a cable ran to the telephones and instruments of the greater monster. Farther off in the fog, of course, were other tanks, hundreds of them, fighting machines all, silent and motionless now, but

infinitely ready to protect the brain of the army.

The G.H.Q. maneuver-board showed the battle as no single observer could ever have seen it. A map lay spread out on a monster board, under a pitiless white light. It was a map of the whole battlefield. Tiny sparks crawled here and there under the map, and there were hundreds of little pins with different-colored heads to mark the position of this thing and that. The crawling sparks were the reported positions of American tanks, made visible as positions of moving trains had been made visible for years on the electric charts of railroads in dispatcher's offices. Where the tiny bulbs glowed under the map, there a tank crawled under the fog. As the tank moved, the first bulb went out and another flashed into light.

The general watched broodingly as the crawling sparks moved from this place to that place, as varicolored lights flashed up and vanished, as a steady hand reached down to shift tiny pins and place new ones. The general moved rarely, and spoke hardly at all. His whole air was that of a man absorbed in a game of chess—a game on which the

fate of a nation depended.

He was thus absorbed. The great board, illuminated from above by the glaring bulb, and speckled with little white sparks from below by the tiny bulbs beneath, showed the situation clearly at every instant. The crawling white sparks were his own tanks, each in its present position. Flashing blue sparks noted the last report of enemy tanks. Two staff officers stood behind the general, and each spoke from time to time into a strapped-on telephone transmitter. They were giving routine orders, heading the nearest American patrol-tanks toward the location of the latest reported enemies.

The general reached out his hand suddenly and marked off an area with his fingers. They were long fingers, and slender ones: an artist's fingers.

"Our outposts are dead in this space," he observed meditatively. The use of the word "outposts" dated him many years back as a soldier, back to the old days of open warfare, which had only now come about again. "Penetration of two miles—"

"Tank, sir," said the man of the steady fingers, putting a black pin in position within that area, "let a man out in a gas-mask to examine a pill-box. The tank does not report or reply, sir."

"Gas," said the general, noting the spot. "Their new gas, of course. It must go through masks or sag-paste, or both."

He looked up to one of a row of officers seated opposite him, each man with headphones strapped to his ears and a transmitter before his lips, and each man with a map-pad on his knees, on which from time to time he made notations and shifted pins absorbedly.

"Captain Harvey," said the general, "you are sure that dead spot has not been bombarded with gas-shells?"

"Yes, General. There has been no artillery fire heavy enough to put more than a fraction of those posts out of action, and all that fire, sir, has been accounted for elsewhere."

The officer looked up, saw the general's eyes shift, and bent to his map again, on which he was marking areas from which spotting aircraft reported flashes as of heavy guns beneath the mist.

"Their aircraft have not been dropping bombs, positively?"

A second officer glanced up from his own map.

"Our planes cover all that space, sir, and have for some time."

"They either have a noiseless tank," observed the general meditatively, "or...."

The steady fingers placed a red pin at a certain spot.

"One observation-post, sir, has reopened communication. Two infantrymen, separated from their command, came upon it and found the machine-gun crew dead, with gas-masks adjusted. No tanks or tracks. They are identified, sir, and are now looking for tank tracks or shells."

The general nodded emotionlessly.

"Let me know immediately."

He fell back to the ceaseless study of the board with its crawling sparks and sudden flashes of light. Over at the left, there were four white sparks crawling toward a spot where a blue flash had showed a little while since. A red light glowed suddenly where one of the white sparks crawled. One of the two officers behind the general spoke crisply. Instantly, it seemed, the other three white sparks changed their direction of movement. They swung toward the red flash—the point where a wireless from the tank represented by the first white flash had reported, contact with the enemy.

"Enemy tank destroyed here, sir," said the voice above the steady fingers.

"Wiped out three of our observation posts," murmured the general, "His side knows it. That's an opportunity. Have those posts reoccupied."

"Orders given, sir," said a staff officer from behind.
"No reports as yet."

The general's eyes went back to the space two miles wide and two miles deep in which there was only a single observation-post functioning, and that in charge of two strayed infantrymen. The battle in the fog was in a formative stage, now, and the general himself had to watch the whole, because it was by small and trivial indications that the enemy's plans would be disclosed. The dead area was no triviality, however. Half a dozen tanks were crawling through it, reporting monotonously that no sign of the enemy could be found. One of the little sparks representing those tanks abruptly went out.

"Tank here, sir, no longer reports."

The general watched with lack-luster eyes, his mind withdrawn in thought.

"Send four helicopters," he said slowly, "to sweep that space. We'll see what the enemy does."

One of the seated officers opposite him spoke swiftly. Far away a roaring set up and was stilled. The helicopters were taking off.

They would rush across the blanket of fog, their vertical propellers sending blasts of air straight downward. For most of their sweep they would keep a good height, but above the questionable ground they would swoop down to barely above the fog-blanket. There their monstrous screws would blow holes in the fog until the ground below was visible. If any tanks crawled there, in the spaces the helicopters swept clear, they would be visible at once and would be shelled by batteries miles away, batteries invisible under the artificial cloud-bank.

No other noises came through the walls of the monster tank. There was a faint, monotonous murmur of the electric generator. There were the quiet, crisp orders of the officers behind the general, giving the routine commands that kept the fighting a stalemate.

The aircraft officer lifted his head, pressing his headphones tightly against his ears, as if to hear

mores clearly.

"The enemy, sir, has sent sixty fighting machines to attack our helicopters. We sent forty single-seaters as escort."

"Let them fight enough," said the general absently, "to cause the enemy to think us desperate for information. Then draw them off."

There was silence again. The steady fingers put pins here and there. An enemy tank destroyed here. An American tank encountered an enemy and ceased to report further. The enemy sent four helicopters in a wide sweep behind the American lines, escorted by fifty fighting planes. They uncovered a squadron of four tanks, which scattered like insects disturbed by the overturning of a stone. Instantly after their disclosure a hundred and fifty guns, four miles away, were pouring shells about the place where they had been seen. Two of the tanks ceased to report.

The general's attention was called to a telephone instrument with its call-light glowing.

"Ah," said the general absently. "They want publicity matter."

The telephone was connected to the rear, and from there to the Capital. A much-worried cabinet waited for news, and arrangements were made and had been used, to broadcast suitably arranged reports from the front, the voice of the commander-in-chief in the field going to every workshop, every gathering-place, and even being bellowed by loud-speakers in the city streets.

The general took the phone. The President of the United States was at the other end of the wire, this time.

"General?"

"Still in a preliminary stage, sir," said the general, without haste. "The enemy is preparing a breakthrough effort, possibly aimed at our machine-shops and supplies. Of course, if he gets them we will have to retreat. An hour ago he paralyzed our radios, not being aware, I suppose, of our tuned earth-induction

wireless sets. I daresay he is puzzled that our communications have not fallen to pieces."

"But what are our chances?" The voice of the President was steady, but it was strained.

"His tanks outnumber ours two to one, of course, sir," said the general calmly. "Unless we can divide his fleet and destroy a part of it, of course we will be crushed in a general combat. But we are naturally trying to make sure that any such action will take place within point-blank range of our artillery, which may help a little. We will cut the fog to secure that help, risking everything, if a general engagement occurs."

There was silence.

The President's voice, when it came, was more strained still.

"Will you speak to the public, General?"

"Three sentences. I have no time for more."

There were little clickings on the line, while the general's eyes returned to the board that was the battlefield in miniature. He indicated a spot with his finger.

"Concentrate our reserve-tanks here," he said meditatively. "Our fighting aircraft here. At once."

The two spots were at nearly opposite ends of the battle field. The chief of staff, checking the general's judgment with the alert suspicion that was the latest addition to his duties, protested sharply.

"But sir, our tanks will have no protection against helicopters!"

"I am quite aware of it," said the general mildly.

He turned to the transmitter. A thin voice had just announced at the other end of the wire, "The commander-in-chief of the army in the field will make a statement."

The general spoke unhurriedly.

"We are in contact with the enemy, have been for some hours. We have lost forty tanks and the enemy, we think, sixty or more. No general engagement has yet taken place, but we think decisive action on the enemy's part will be attempted within two hours. The tanks in the field need now, as always, ammunition, spare tanks, and the special supplies for modern warfare. In particular, we require ever-increasing quantities of fog-gas. I appeal to your patriotism for reinforcements of material and men."

He hung up the receiver and returned to his survey of the board.

"Those three listening-posts," he said abruptly, indicating a place near where an enemy tank had been destroyed. "Have they been reoccupied?"

"Yes, sir. Just reported. The tank they reported rolled over them, destroying the placement. They are digging in."

"Tell me," said the general, "when they cease to report again. They will."

He watched the board again and without lifting his eyes from it, spoke again.

"That listening-post in the dead sector, with the two strayed infantrymen in it. Was it reported?"

"Not yet, sir."

"Tell me immediately it does."

The general leaned back in his chair and deliberately relaxed. He lighted a cigar and puffed at it, his hands quite steady. Other officers, scenting the smoke, glanced up enviously. But the general was the only man who might smoke. The enemy's gases, like the American ones, could go through any gas-mask if in sufficient concentration. The tanks were sealed like so many submarines, and opened their interiors to the outer air only after that air had been thoroughly tested and proven safe. Only the general might use up more than a man's allowance for breathing.

The general gazed about him, letting his mind rest from its intense strain against the greater strain that

would come on it in a few minutes. He looked at a tall blond man who was surveying the board intently, moving away, and returning again, his forehead creased in thought.

The general smiled quizzically. That man was the officer appointed to I. I. duty—interpretative intelligence—chosen from a thousand officers because the most exhaustive psychological tests had proven that his brain worked as nearly as possible like that of the enemy commander. His task was to take the place of the enemy commander, to reconstruct from the enemy movements reported and the enemy movements known as nearly as possible the enemy plans.

"Well, Harlin," said the general, "Where will he strike?"

"He's tricky, sir," said Harlin. "That gap in our listening-posts looks, of course, like preparation for a massing of his tanks inside our lines. And it would be logical that he fought off our helicopters to keep them from discovering his tanks massing in that area."

The general nodded.

"Quite true," he admitted. "Quite true."

"But," said Harlin eagerly. "He'd know we could figure that out. And he may have wiped out listening posts to make us think he was planning just so. He may have fought off our helicopters, not to keep them from discovering his tanks in there, but to keep them from discovering that there were no tanks in there!"

"My own idea exactly," said the general meditatively. "But again, it looks so much like a feint that it may be a serious blow. I dare not risk assuming it to be a feint only."

He turned back to the board.

"Have those two strayed infantrymen reported yet?" he asked sharply.

"Not yet, sir."

The general drummed on the table. There were four

red flashes glowing at different points of the board—four points where American tanks or groups of tanks were locked in conflict with the enemy. Somewhere off in the enveloping fog that made all the world a gray chaos, lumbering, crawling monsters rammed and battered at each other at infinitely short range. They fought blindly, their guns swinging menacingly and belching lurid flames into the semi-darkness, while from all about them dropped the liquids that meant death to any man who breathed their vapor. Those gases penetrated any gas-mask, and would even strike through the sag-pastes that had made the vesicatory gases of 1918 futile.

With tanks by thousands hidden in the fog, four small combats were kept up, four only. Battles fought with tanks as the main arm are necessarily battles of movement, more nearly akin to cavalry battles than any other unless it be fleet actions. When the main bodies come into contact, the issue is decided quickly. There can be no long drawn-out stalemates such as infantry trenches produced in years past. The fighting that had taken place so far, both under the fog and

aloft in the air, was outpost skirmishing only. When the main body of the enemy came into action it would be like a whirlwind, and the battle would be won or lost in a matter of minutes only.

The general paid no attention to those four conflicts, or their possible meaning.

"I want to hear from those two strayed infantrymen," he said quietly, "I must base my orders on what they report. The whole battle, I believe, hinges on what they have to say."

He fell silent, watching the board without the tense preoccupation he had shown before. He knew the moves he had to make in any of three eventualities. He watched the board to make sure he would not have to make those moves before he was ready. His whole air was that of waiting: the commander-in-chief of the army of the United States, waiting to hear what he would be told by two strayed infantrymen, lost in the fog that covered a battlefield.

The fog was neither more dense nor any lighter

where Corporal Wallis paused to roll his pre-war cigarette. The tobacco came from the gassed machine-gunner in the pill-box a few yards off. Sergeant Coffee, three yards distant, was a blurred figure. Corporal Wallis put his cigarette into his mouth, struck his match, and puffed delicately.

"Ah!" said Corporal Wallis, and cheered considerably. He thought he saw Sergeant Coffee moving toward him and ungenerously hid his cigarette's glow.

Overhead, a machine-gun suddenly burst into a rattling roar, the sound sweeping above them with incredible speed. Another gun answered it. Abruptly, the whole sky above them was an inferno of such tearing noises and immediately after they began a multitudinous bellowing set up. Airplanes on patrol ordinarily kept their engines muffled, in hopes of locating a tank below them by its noise. But in actual fighting there was too much power to be gained by cutting out the muffler for any minor motive to take effect. A hundred aircraft above the heads of the two strayed infantrymen were fighting madly about five helicopters. Two hundred yards away, one fell to the

earth with a crash, and immediately afterward there was a hollow boom. For an instant even the mist was tinged with yellow from the exploded gasoline tank. But the roaring above continued—not mounting, as in a battle between opposing patrols of fighting planes, when each side finds height a decisive advantage, but keeping nearly to the same level, little above the bank of cloud.

Something came down, roaring, and struck the earth no more than fifty yards away. The impact was terrific, but after it there was dead silence while the thunder above kept on.

Sergeant Coffee came leaping to Corporal Wallis' side.

"Helicopters!" he barked. "Huntin' tanks an' pill-boxes! Lay down!"

He flung himself down to the earth.

Wind beat on them suddenly, then an outrageous blast of icy air from above. For an instant the sky lightened.

They saw a hole in the mist, saw the little pill-box clearly, saw a huge framework of supporting screws sweeping swiftly overhead with figures in it watching the ground through wind-angle glasses, and machine-gunners firing madly at dancing things in the air. Then it was gone.

"One o' ours," shouted Coffee in Wallis' ear. "They' tryin' to find th' Yellows' tanks!"

The center of the roaring seemed to shift, perhaps to the north. Then a roaring drowned out all the other roarings. This one was lower down and approaching in a rush. Something swooped from the south, a dark blotch in the lighter mist above. It was an airplane flying in the mist, a plane that had dived into the fog as into oblivion. It appeared, was gone—and there was a terrific crash. A shattering roar drowned out even the droning tumult of a hundred aircraft engines. A sheet of flame flashed up, and a thunderous detonation.

"Hit a tree," panted Coffee, scrambling to his feet again. "Suicide club, aimin' for our helicopter."

Corporal Wallis was pointing, his lips drawn back in a snarl.

"Shut up!" he whispered. "I saw a shadow against that flash! Yeller infantryman! Le's get 'im!"

"Y'crazy," said Sergeant Coffee, but he strained his eyes and more especially his ears.

It was Coffee who clutched Corporal Wallis' wrist and pointed. Wallis could see nothing, but he followed as Coffee moved silently through the gray mist.

Presently he too, straining his eyes, saw an indistinct movement.

The roaring of motors died away suddenly. The fighting had stopped, a long way off, apparently because the helicopters had been withdrawn. Except for the booming of artillery a very long distance away, firing unseen at an unseen target, there was no noise at all.

"Aimin' for our pill-box," whispered Coffee.

They saw the dim shape, moving noiselessly, halt. The dim figure seemed to be casting about for something. It went down on hands and knees and crawled forward. The two infantrymen crept after it. It stopped, and turned around. The two dodged to one side in haste. The enemy infantryman crawled off in another direction, the two Americans following him as closely as they dared.

He halted once more, a dim and grotesque figure in the fog. They saw him fumbling in his belt. He threw something, suddenly. There was a little tap as of a fountain pen dropped upon concrete. Then a hissing sound. That was all, but the enemy infantryman waited, as if listening....

The two Americans fell upon him as one individual. They bore him to the earth and Coffee dragged at his gas-mask, good tactics in a battle where every man carries gas-grenades. He gasped and fought desperately, in a seeming frenzy of terror.

They squatted over him, finally, having taken away his automatics, and Coffee worked painstakingly to get

off his gas-mask while Wallis went poking about in quest of tobacco.

"Dawggone!" said Coffee. "This mask is intricate."

"He ain't got any pockets," mourned Wallis.

Then they examined him more closely.

"It's a whole suit," explained Coffee. "H-m.... He don't have to bother with sag-paste. He's got him on a land diving-suit."

"S-s-say," gasped the prisoner, his language utterly colloquial in spite of the beady eyes and coarse black hair that marked him racially as of the enemy, "say, don't take off my mask! Don't take off my mask!"

"He talks an' everything," observed Coffee in mild amazement. He inspected the mask again and painstakingly smashed the goggles. "Now, big boy, you take your chance with th' rest of us. What' you doin' around here?"

The prisoner set his teeth, though deathly pale, and did not reply.

"H'm-m...." said Coffee meditatively. "Let's take him in the pill-box an' let Loot'n't Madison tell us what to do with him."

They picked him up.

"No! No! For Gawd's sake, no!" cried the prisoner shrilly. "I just gassed it!"

The two halted. Coffee scratched his nose.

"Reckon he's lyin', Pete?" he asked.

Corporal Wallis shrugged gloomily.

"He ain't got any tobacco," he said morosely. "Let's chuck him in first an' see."

The prisoner wriggled until Coffee put his own automatic in the small of his back.

"How long does that gas last?" he asked, frowning.

"Loot'n't Madison wants us to report. There's some fellers in there, all gassed up, but we were in there a while back an' it didn't hurt us. How long does it last?"

"Fur-fifteen minutes, maybe twenty," chattered the prisoner. "Don't put me in there!"

Coffee scratched his nose again and looked at his wrist-watch.

"A'right," he conceded, "we give you twenty minutes. Then we chuck you down inside. That is, if you act real agreeable until then. Got anything to smoke?"

The prisoner agonizedly opened a zipper slip in his costume and brought out tobacco, even tailor-made cigarettes. Coffee pounced on them one second before Wallis. Then he divided them with absorbed and scrupulous fairness.

"Right," said Sergeant Coffee comfortably. He lighted up. "Say, you, if y' want to smoke, here's one o' your pills. Let's see the gas stuff. How' y' use it?"

Wallis had stripped off a heavy belt about the prisoner's waist and it was trailing over his arm. He inspected it now. There were twenty or thirty little sticks in it, each one barely larger than a lead pencil, of dirty gray color, and each one securely nested in a tube of flannel-lined papier-mache.

"These things?" asked Wallis contentedly. He was inhaling deeply with that luxurious enjoyment a tailor-made cigarette can give a man who had been remaking butts into smokes for days past.

"Don't touch 'em," warned the prisoner nervously.

"You broke my goggles. You throw 'em, and they light and catch fire, and that scatters the gas."

Coffee touched the prisoner, indicating the ground, and sat down, comfortably smoking one of the prisoner's cigarettes. By his air, he began to approve of his captive.

"Say, you," he said curiously, "you talk English pretty good. How'd you learn it?"

"I was a waiter," the prisoner explained. "New York. Corner Forty-eighth and Sixth."

"My Gawd!" said Coffee. "Me, I used to be a movie operator along there. Forty-ninth. Projection room stuff, you know. Say, you know Heine's place?"

"Sure," said the prisoner. "I used to buy Scotch from that blond feller in the back room. With a benzine label for a prescription?"

Coffee lay back and slapped his knee.

"Ain't it a small world?" he demanded. "Pete, here, he ain't never been in any town bigger than Chicago. Ever in Chicago?"

"Hell," said Wallis, morose yet comfortable with a tailor-made cigarette. "If you guys want to start a extra war, go to knockin' Chicago. That's all."

Coffee looked at his wrist-watch again.

"Got ten minutes yet," he observed. "Say, you must

know Pete Hanfry—"

"Sure I know him," said the enemy prisoner, scornfully. "I waited on him. One day, just before us reserves were called back home...."

In the monster tank that was headquarters the general tapped his fingers on his knees. The pale white light flickered a little as it shone on the board where the bright sparks crawled. White sparks were American tanks. Blue flashes were for enemy tanks sighted and reported, usually in the three-second interval between their identification and the annihilation of the observation-post that had reported them. Red glows showed encounters between American and enemy tanks. There were a dozen red glows visible, with from one to a dozen white sparks hovering about them. It seemed as if the whole front line were about to burst into a glare of red, were about to become one long lane of conflicts in impenetrable obscurity, where metal monsters roared and rumbled and clanked one against the other, bellowing and belching flame and ramming each other savagely, while from them dripped the liquids

that made their breath mean death. There were nightmarish conflicts in progress under the blanket of fog, unparalleled save perhaps in the undersea battles between submarines in the previous European war.

The chief of staff looked up; his face drawn.

"General," he said harshly, "it looks like a frontal attack all along our line."

The general's cigar had gone out. He was pale, but calm with an iron composure.

"Yes," he conceded. "But you forget that blank spot in our line. We do not know what is happening there."

"I am not forgetting it. But the enemy outnumbered us two to one—"

"I am waiting," said the general, "to hear from those two infantrymen who reported some time ago from a listen-post in the dead area."

The chief of staff pointed to the outline formed by the

red glows where tanks were battling.

"Those fights are keeping up too long!" he said sharply. "General, don't you see, they're driving back our line, but they aren't driving it back as fast as if they were throwing their whole weight on it! If they were making a frontal attack there, they'd wipe out the tanks we have facing them; they'd roll right over them! That's a feint! They're concentrating in the dead space—"

"I am waiting," said the general softly, "to hear from those two infantrymen." He looked at the board again and said quietly, "Have the call-signal sent them. They may answer."

He struck a match to relight his dead cigar. His fingers barely quivered as they held the match. It might have been excitement—but it might have been foreboding, too.

"By the way," he said, holding the match clear, "have our machine-shops and supply-tanks ready to move. Every plane is, of course, ready to take the air on

signal. But get the aircraft ground personnel in their traveling tanks immediately."

Voices began to murmur orders as the general puffed. He watched the board steadily.

"Let me know if anything is heard from these infantrymen...."

There was a definite air of strain within the tank that was headquarters. It was a sort of tensility that seemed to emanate from the general himself.

Where Coffee and Wallis and the prisoner squatted on the ground, however, there was no sign of strain at all. There was a steady gabble of voices.

"What kinda rations they give you?" asked Coffee interestedly.

The enemy prisoner listed them, with profane side-comments.

"Hell," said Wallis gloomily. "Y'ought to see what we

get! Las' week they fed us worse'n dogs. An' th' canteen stuff—"

"Your tank men, they get treated fancy?" asked the prisoner.

Coffee made a reply consisting almost exclusively of high powered expletives.

"—and the infantry gets it in the neck every time," he finished savagely. "We do the work—"

Guns began to boom, far away. Wallis cocked his ears.

"Tanks gettin' together," he judged, gloomily. "If they'd all blow each other to hell an' let us infantry fight this battle—"

"Damn the tanks!" said the enemy prisoner viciously. "Look here, you fellers. Look at me. They sent a battalion of us out, in two waves. We hike along by compass through the fog, supposed to be five paces apart. We come on a pill-box or listenin' post, we gas it an' go on. We try not to make a noise. We try not to

get seen before we use our gas. We go on, deep in your lines as we can. We hear one of your tanks, we dodge it if we can, so we don't get seen at all.

O'course we give it a dose of gas in passing, just in case. But we don't get any orders about how far to go or how to come back. We ask for recognition signals for our own tanks, an' they grin an' say we won't see none of our tanks till the battle's over. They say 'Reform an' march back when the fog is out.' Ain't that pretty for you?"

"You second wave?" asked Coffee, with interest.

The prisoner nodded.

"Mopping up," he said bitterly, "what the first wave left. No fun in that! We go along gassin' dead men, an' all the time your tanks is ravin' around to find out what's happenin' to their listenin'-posts. They run into us—"

Coffee nodded sympathetically.

"The infantry always gets the dirty end of the stick,"

said Wallis morosely.

Somewhere, something blew up with a violent explosion. The noise of battle in the distance became heavier and heavier.

"Goin' it strong," said the prisoner, listening.

"Yeh," said Coffee. He looked at his wrist-watch. "Say, that twenty minutes is up. You go down in there first, big boy."

They stood beside the little pill-box. The prisoner's knees shook.

"Say, fellers," he said pleadingly, "they told us that stuff would scatter in twenty minutes, but you busted my mask. Yours ain't any good against this gas. I'll have to go down in there if you fellers make me, but —"

Coffee lighted another of the prisoner's tailor-made cigarettes.

"Give you five minutes more," he said graciously. "I don't suppose it'll ruin the war."

They sat down relievedly again, while the fog-gas made all the earth invisible behind a pall of grayness, a grayness from which the noises of battle came.

In the tank that was headquarters, the air of strain was pronounced. The maneuver-board showed the situation as close to desperation, now. The reserve-tank positions had been switched on the board, dim orange glows, massed in curiously precise blocks. And little squares of green showed there that the supply and machine-shop tanks were massed. They were moving slowly across the maneuver-board. But the principal change lay in the front-line indications.

The red glows that showed where tank battles were in progress formed an irregularly curved line, now. There were twenty or more such isolated battles in progress, varying from single combats between single tanks to greater conflicts where twenty to thirty tanks to a side were engaged. And the positions of those conflicts were changing constantly, and invariably the

American tanks were being pushed back.

The two staff officers behind the general were nearly silent. There were few sparks crawling within the American lines now. Nearly every one had been diverted into the front-line battles. The two men watched the board with feverish intensity, watching the red glows moving back, and back....

The chief of staff was shaking like a leaf, watching the American line stretched, and stretched....

The general looked at him with a twisted smile.

"I know my opponent," he said suddenly. "I had lunch with him once in Vienna. We were attending a disarmament conference." He seemed to be amused at the ironic statement. "We talked war and battles, of course. And he showed me, drawing on the tablecloth, the tactical scheme that should have been used at Cambrai, back in 1917. It was a singularly perfect plan. It was a beautiful one."

"General," burst out one of the two staff officers

behind him. "I need twenty tanks from the reserves."

"Take them," said the general. He went on, addressing his chief of staff. "It was an utterly flawless plan. I talked to other men. We were all pretty busy estimating each other there, we soldiers. We discussed each other with some freedom, I may say. And I formed the opinion that the man who is in command of the enemy is an artist: a soldier with the spirit of an amateur. He's a very skilful fencer, by the way. Doesn't that suggest anything?"

The chief of staff had his eyes glued to the board.

"That is a feint, sir. A strong feint, yes, but he has his force concentrated in the dead area."

"You are not listening, sir," said the general, reprovingly. "I am saying that my opponent is an artist, an amateur, the sort of person who delights in the delicate work of fencing. I, sir, would thank God for the chance to defeat my enemy. He has twice my force, but he will not be content merely to defeat me. He will want to defeat me by a plan of consummate

artistry, which will arouse admiration among soldiers for years to come."

"But General, every minute, every second—"

"We are losing men, of whom we have plenty, and tanks, of which we have not enough. True, very true," conceded the general. "But I am waiting to hear from two strayed infantrymen. When they report, I will speak to them myself."

"But, sir," cried the chief of staff, withheld only by the iron habit of discipline from violent action and the taking over of command himself, "they may be dead! You can't risk this battle waiting for them! You can't risk it, sir! You can't!"

"They are not dead," said the general coolly. "They cannot be dead. Sometimes, sir, we must obey the motto on our coins. Our country needs this battle to be won. We have got to win it, sir! And the only way to win it—"

The signal-light at his telephone glowed. The general

snatched it up, his hands quivering. But his voice, was steady and deliberate as he spoke.

"Hello, Sergeant—Sergeant Coffee, is it?... Very well, Sergeant. Tell me what you've found out.... Your prisoner objects to his rations, eh? Very well, go on.... How did he gas our listening-posts?... He did, eh? He got turned around and you caught him wandering about?... Oh, he was second wave! They weren't taking any chances on any of our listening-posts reporting their tanks, eh?... Say that again, Sergeant Coffee!" The general's tone had changed indescribably. "Your prisoner has no recognition signals for his own tanks? They told him he wouldn't see any of them until the battle was over?... Thank you, Sergeant. One of our tanks will stop for you. This is the commanding general speaking."

He rang off, his eyes blazing. Relaxation was gone. He was a dynamo, snapping orders.

"Supply tanks, machine-shop tanks, ground forces of the air service, concentrate here!" His finger rested on a spot in the middle of the dead area. "Reserve

tanks take position behind them. Draw off every tank we've got—take 'em out of action!—and mass them in front, on a line with our former first line of outposts. Every airplane and helicopter take the air and engage in general combat with the enemy, wherever the enemy may be found and in whatever force. And our tanks move straight through here!"

Orders were snapping into telephone transmitters. The commands had been relayed before their import was fully realized. Then there was a gasp.

"General!" cried the chief of staff. "If the enemy is massed there, he'll destroy our forces in detail as they take position!"

"He isn't massed there," said the general, his eyes blazing. "The infantrymen who were gassing our listening-posts were given no recognition signals for their tanks. Sergeant Coffee's prisoner has his gas-mask broken and is in deadly fear. The enemy commander is foolish in many ways, perhaps, but not foolish enough to break down morale by refusing recognition signals to his own men who will need

them. And look at the beautiful plan he's got."

He sketched half a dozen lines with his fingers, moving them in lightning gestures as his orders took effect.

"His main force is here, behind those skirmishes that look like a feint. As fast as we reinforce our skirmishing-line, he reinforces his—just enough to drive our tanks back slowly. It looks like a strong feint, but it's a trap! This dead space is empty. He thinks we are concentrating to face it. When he is sure of it—his helicopters will sweep across any minute, now, to see—he'll throw his whole force on our front line. It'll crumple up. His whole fighting force will smash through to take us, facing the dead space, in the rear! With twice our numbers, he'll drive us before him."

"But general! You're ordering a concentration there! You're falling in with his plans!"

The general laughed.

"I had lunch with the general in command over there, once upon a time. He is an artist. He won't be content with a defeat like that! He'll want to make his battle a masterpiece, a work of art! There's just one touch he can add. He has to have reserves to protect his supply-tanks and machine-shops. They're fixed. The ideal touch, the perfect tactical fillip, will be—Here! Look. He expects to smash in our rear, here. The heaviest blow will fall here. He will swing around our right wing, drive us out of the dead area into his own lines—and drive us on his reserves! Do you see it? He'll use every tank he's got in one beautiful final blow. We'll be outwitted, out-numbered, out-flanked and finally caught between his main body and his reserves and pounded to bits. It is a perfect, a masterly bit of work!"

He watched the board, hawklike.

"We'll concentrate, but our machine-shops and supplies will concentrate with us. Before he has time to take us in rear we'll drive ahead, in just the line he plans for us! We don't wait to be driven into his reserves. We roll into them and over them! We smash

his supplies! We destroy his shops! And then we can advance along his line of communication and destroy it, our own depots being blown up—give the orders when necessary—and leaving him stranded with motor-driven tanks, motorized artillery, and nothing to run his motors with! He'll be marooned beyond help in the middle of our country, and we will have him at our mercy when his tanks run out of fuel. As a matter of fact, I shall expect him to surrender in three days."

The little blocks of green and yellow that had showed the position of the reserve and supply-tanks, changed abruptly to white, and began to crawl across the maneuver-board. Other little white sparks turned about. Every white spark upon the maneuver-board suddenly took to itself a new direction.

"Disconnect cables," said the general, crisply. "We move with our tanks, in the lead!"

The monotonous humming of the electric generator was drowned out in a thunderous uproar that was muffled as an air-tight door was shut abruptly. Fifteen

seconds later there was a violent lurch, and the colossal tank was on the move in the midst of a crawling, thundering horde of metal monsters whose lumbering progress shook the earth.

Sergeant Coffee, still blinking his amazement, absent-mindedly lighted the last of his share of the cigarettes looted from the prisoner.

"The big guy himself!" he said, still stunned. "My Gawd! The big guy himself!"

A distant thunder began, a deep-toned rumbling that seemed to come from the rear. It came nearer and grew louder. A peculiar quivering seemed to set up in the earth. The noise was tanks moving through the fog, not one tank or two tanks, or twenty tanks, but all the tanks in creation rumbling and lurching at their topmost speed in serried array.

Corporal Wallis heard, and turned pale. The prisoner heard, and his knees caved in.

"Hell," said Corporal Wallis despairingly. "They can't

see us, an' they couldn't dodge us if they did!"

The prisoner wailed, and slumped to the floor.

Coffee picked him up by the collar and jerked him out of the pill-box.

"C'mon Pete," he ordered briefly. "They ain't givin' us a infantryman's chance, but maybe we can do some dodgin'!"

Then the roar of engines, of metal treads crushing upon earth and clinking upon their joints, drowned out all possible other sounds. Before the three men beside the pill-box could have moved a muscle, monster shapes loomed up, rushing, rolling, lurching, squeaking. They thundered past, and the hot fumes of their exhausts enveloped the trio.

Coffee growled and put himself in a position of defiance, his feet braced against the concrete of the pill-box dome. His expression was snarling and angry but, surreptitiously, he crossed himself. He heard the fellows of the two tanks that had roared by him,

thundering along in alignment to right and left. A twenty-yard space, and a second row of the monsters came hurtling on, gun muzzles gaping, gas-tubes elevated, spitting smoke from their exhausts that was even thicker than the fog. A third row, a fourth, a fifth....

The universe was a monster uproar. One could not think in this volume of sound. It seemed that there was fighting overhead. Crackling noises came feebly through the reverberating uproar that was the army of the United States in full charge. Something came whirling down through the overhanging mist and exploded in a lurid flare that for a second or two cast the grotesque shadows of a row of tanks clearly before the trio of shaken infantrymen.

Still the tanks came on and roared past. Twenty tanks, twenty-one ... twenty-two.... Coffee lost count, dazed and almost stunned by the sheer noise. It rose from the earth and seemed to be echoed back from the topmost limit of the skies. It was a colossal din, an incredible uproar, a sustained thunder that beat at the eardrums like the reiterated concussions of a

thousand guns that fired without ceasing. There was no intermission, no cessation of the tumult. Row after row after row of the monsters roared by, beaked and armed, going greedily with hungry guns into battle.

[Image description start: A black and white illustration of large, futuristic metal tanks driving by through the darkness, with the one in the foreground crushing pieces of metal that were in its way. Image description end.]

And then, for a space of seconds, no tanks passed. Through the pandemonium of their going, however, the sound of firing somehow seemed to creep. It was gunfire of incredible intensity, and it came from the

direction in which the front-rank tanks were heading.

"Forty-eight, forty-nine, forty-ten, forty-'leven," muttered Coffee dazedly, his senses beaten down almost to unconsciousness by the ordeal of sound. "Gawd! The whole army went by!"

The roaring of the fighting-tanks was less, but it was still a monstrous din. Through it, however, came now a series of concussions that were so close together that they were inseparable, and so violent that they were like slaps upon the chest.

Then came other noises, louder only because nearer. These were different noises, too, from those the fighting-tanks had made. Lighter noises. The curious, misshapen service tanks began to rush by, of all sizes and all shapes. Fuel-carrier tanks. Machine-shop tanks, huge ones, these. Commissary tanks....

Something enormous and glistening stopped short. A door opened. A voice roared an order. The three men, beaten and whipped by noise, stared dumbly.

"Sergeant Coffee!" roared the voice. "Bring your men! Quick!"

Coffee dragged himself back to a semblance of life. Corporal Wallis moved forward, sagging. The two of them loaded their prisoner into the door and tumbled in. They were instantly sent into a heap as the tank took up its progress again with a sudden sharp leap.

"Good man," grinned a sooty-faced officer, clinging to a handhold. "The general sent special orders you were to be picked up. Said you'd won the battle. It isn't finished yet, but when the general says that—"

"Battle?" said Coffee dully. "This ain't my battle. It's a parade of a lot of damn tanks!"

There was a howl of joy from somewhere above. Discipline in the machine-shop tanks was strict enough, but vastly different in kind from the formality of the fighting-machines.

"Contact!" roared the voice again. "General wireless is going again! Our fellows have rolled over their

reserves and are smashing their machine-shops and supplies!"

Yells reverberated deafeningly inside the steel walls, already filled with tumult from the running motors and rumbling treads.

"Smashed 'em up!" shrieked the voice above, insane with joy. "Smashed 'em! Smashed 'em! Smashed 'em! We've wiped out their whole reserve and—" A series of detonations came through even the steel shell of the lurching tank. Detonations so violent, so monstrous, that even through the springs and treads of the tank the earth-concussion could be felt. "There goes their ammunition! We set off all their dumps!"

There was sheer pandemonium inside the service-tank, speeding behind the fighting force with only a thin skin of reserve-tanks between it and a panic-stricken, mechanically pursuing enemy.

"Yell, you birds!" screamed the voice. "The general says we've won the battle! Thanks to the fighting force! We're to go on and wipe out the enemy line of

communications, letting him chase us till his gas gives out! Then we come back and pound him to bits! Our tanks have wiped him out!"

Coffee managed to find something to hold on to. He struggled to his feet. Corporal Wallis, recovering from the certainty of death and the torture of sound, was being very sea-sick from the tank's motion. The prisoner moved away from him on the steel floor. He looked gloomily up at Coffee.

"Listen to 'em," said Coffee bitterly. "Tanks! Tanks! Tanks! Hell! If they'd given us infantry a chance—"

"You said it," said the prisoner savagely. "This is a hell of a way to fight a war."

Corporal Wallis turned a greenish face to them.

"The infantry always gets the dirty end of the stick," he gasped. "Now they—now they' makin' infantry ride in tanks! Hell!"

#07 Invisible Death by Anthony Pelcher:

On Lees' quick and clever action depended the life of "Old Perk" Ferguson, the millionaire manufacturer threatened by the uncanny, invisible killer.

- - -

The inquest into the mysterious death of Darius Darrow, savant, inventor, recluse and eccentric, resembled a scientific convention. Men and women of high scientific attainment, and, in some instances, world fame, attended to hear first hand the strange, uncanny, unbelievable circumstances as hinted by the newspapers.

Mrs. Susan Darrow, the widow, was the paramount witness. She appeared a quaint figure as she took the stand. Tearful, yet alert, this little woman betrayed the intelligence that had made her one of the world's

foremost chemists. She gave her age as fifty-eight, but if it had not been for her snowy hair she would have looked much younger. She was small but not frail, and had expressive blue eyes. She had a firm little nose and chin, and was garbed in black silk garments of a fashion evidently dating back a decade.

Although not modern in dress, her answers to questions regarding scientific and business affairs involved in the mysterious case, proved she was thoroughly abreast of the times in all other particulars.

"You believe your husband was murdered?" bluntly asked the examiner at one stage.

"That is my opinion," she said, then added: "It might have been some scientific accident, the nature of which I cannot fathom. We were confidential in all matters except my husband's work. He reserved the right to be secretive about the scientific problems on which he was working."

"Can you throw any light on a motive for such a

crime?"

"The motive seems self-evident. He was working on an invention that he said would do away with war and would make the owner of the device a practical world dictator, should he choose to exercise such power. The device was completed. The murderer killed him to secure his device. That all seems plain enough."

"Was anything else of value taken?"

"We had nothing else of value about the place. I was never given to jewelry. The furnishings and equipment were undisturbed. It is quite evident, I think, that the thief was no ordinary petty burglar."

The attorney interposed: "I believe we had better let Mrs. Darrow tell this story from the beginning in her own way. There are only two really important witnesses. Whatever she can remember to recite might be of value to the authorities. Now, Mrs. Darrow, how long had you lived at Brooknook? Begin there and just let your story unfold. Try to control your nerves and emotions."

"I am not emotional. I am not nervous," said the quaint little woman, bravely. "My heart hurts, that is all."

"The place was named by my father. We inherited it at his death, thirty years ago, and moved in. My two children were born and died there. At first we kept the servants and maintained all of the thirty-two rooms. But after the children were gone, we both gave ourselves over to study and we began to close one room after another, releasing the servants one by one."

"How many rooms do you occupy now?"

"We lived in three, a living-room, kitchen and bedroom. The two big parlors were turned into a laboratory. We both worked there. It was there my husband met his death at his work. Sometimes we worked together, sometimes independently. I did all my own housework, except the laundry, which I sent out. We had no visitors. We lived for each other and our work."

"Tell us about the rooms that were not occupied."

"We left them just as they always had been. I have not been in any of these rooms for twenty years. Once I looked into the little girl's room—my daughter's room. It was dusty and cobwebby, but undisturbed by human hand. My husband peered in over my shoulder. I closed the door. We turned away in each other's arms."

Here the little old woman fell to weeping softly into her lace handkerchief. Minutes lapsed as the court waited, respecting her grief.

"Were these rooms locked?" asked the attorney finally.

"No," said the widow, recovering, as she dabbed at her eyes. "We feared no one. All the rooms were closed, but not locked. The outside doors were seldom locked. We lived in our own world. For appearance sake we kept up the grounds. Peck, the gardener, kept the grounds, as you know. He called in outside help when necessary. This was his affair. We never bothered him. He lived probably a half mile up the

road. The first of each month he would come for his pay. He was practically our only visitor.

"When it was necessary to see our attorney or other connections, Peck would drive us. At first he used to drive our horses. Ten years ago we pastured the horses for life and bought the small car. We seldom went out. We have no close friends and no relatives nearer than the Pacific coast. They are distant cousins. You see, we were rather alone in the world since the children went away—we never spoke of them as being dead."

Again the court was hushed. The coroner and the attorney took occasion to blow their noses rather violently.

"On May 27th, the day your husband died, what happened, as you re-remember it?" asked the attorney.

"We arose and had breakfast as usual. I was puttering about the rooms. My husband kissed me and started for the laboratory. I was in the kitchen. It was about

ten o'clock when I finished in the kitchen and went into the living room which adjoins the laboratory. I had been rather fretted, something unusual for me. It seemed I dimly sensed the presence of someone near me, someone I did not know, an outsider. I thought it was foolish of me and buckled up.

"But when I went into the living room, it seemed as if some invisible presence were following me. I could hear the low hum of my husband's device. The door of the laboratory was open. He called to me and said:

"Sue dear, it seems strange, but I made two models of this set and now I can find only one. You could not have misplaced the other by any chance, could you?"

"I assured him I knew nothing of it and he said, 'Hum-m, that's funny.' Then he went back into the library and closed the door. The humming continued. I was more annoyed than ever, but I did not want to bother my husband. Then a queer thing happened. I saw the door of the laboratory open and close, but I did not see anyone. The next instant, I heard my husband's outcry. It was more a groan than a scream.

"I rushed into the laboratory. My husband was lying by his slate-topped table. The device, I noticed, was gone. It was no bigger than a coffee-mill, I thought, as I bent over my husband. Strange how such a thought could have crowded in at such a time.

"My husband's head was bleeding. It was cut, a long gash over the ear, just below the bald spot. It must have been a frightful blow. I looked in his eyes. My nurse's and pharmaceutical course gave me knowledge which sent a chill to my heart. He was dead. I must have fainted.

"When I recovered I ran for Peck. I found him near the house, coming my way and holding his right eye.

"'Something struck me,' he said. Then, seeing me so pale, he said, 'My God! Mrs. Darrow, what has happened?'

"'Run for the doctor,' I said. When the doctor came he called the police and coroner. They told me not to disturb the body. Later they took it away, and the gardener told me—"

"Never mind what Peck told you," interrupted the attorney. "We will let him tell it. Is that all you can tell us about the death itself?"

But the widow was weeping now, so violently that the court ordered her excused.

The gardener was called and took the stand displaying a big, black eye, which offered comedy relief to a pathetic situation.

"On the main road to the east," he began after preliminary questioning, "was a small car which had been parked there all morning. I noticed it because it had no license plates. It was visible from the inside of the grounds, but was hidden from the road by a hedge. It made me wonder because it was just inside our grounds.

"I had some very special red flags which I planted as a border back of pink geraniums. They were doing fine. I got them from the Fabrish seed house. There are no plants like Fabrish's—I wouldn't give a snap of my finger for all the other—"

"Just a minute," interrupted the attorney. He told the gardener to never mind the geraniums and flags, but to tell just what happened.

"Well, I was bending over the border bed when I heard sounds like someone running along the gravel path towards me. I heard a humming like a bumble bee and I jumped to my feet. Just then something hit me in the eye and knocked me down. Yes sir, knocked me plumb down, and—"

"Then what happened? Never mind the asides, the extras—tell us just the simple facts," instructed the attorney.

"Well, you won't believe it, but I heard the footsteps leave the road. The geraniums were badly trampled. I looked at the parked automobile and could hear the hum coming from there.

"The machine started and turned into the road—"

"Did you notice anyone at the wheel?"

"That's what you're not going to believe. There wasn't anybody in that auto at all. I didn't see anyone at any time. The auto started itself, and what is more, that auto only went about a hundred yards when it disappeared altogether—like that—like a flash."

"Did it turn off the road?"

"I didn't turn anywhere. It was in the middle of the road. It just disappeared right in the middle of the road. It started without a driver, it turned north without a driver, and went on by itself for about a hundred yards. Then it vanished in the middle of the road. Just dropped out of sight."

The court-room was hushed. The audience and court attaches were awe stricken and looked their incredulity.

"Do you mean to tell us that auto drove itself?" asked the court sternly.

The witness was completely confused. The attorney came to his rescue, looked at the court, and said:

"He has told that same story a hundred times, and he will stick to it. It seems impossible, but has not Mrs. Darrow told us she heard this humming and saw nothing? With the purely perfunctory recitals of the doctor and the constabulary this court and the jury have heard all there is to hear. We have no more witnesses. That is all there is.

"The jury will have to decide from the evidence whether this case is accident or murder. The doctor and two experts have reported that the wound appeared to have been made by some blunt instrument, swung powerfully. The skull under the wound and back of the ear was simply crushed. Death was instantaneous. It all happened in broad daylight."

After an hour's deliberation the jury decided the savant came to his death in his laboratory from a blow on the skull received in some manner unknown.

The crowd filed out, spiritedly discussing the unusual crime. In the crowd was Perkins Ferguson, known as "Old Perk," head of the Schefert Engineering Corporation, who paid royalty on some of the Darrow

patents. With him was Damon Farnsworth, his first vice-president.

"Well, what do you think of it?" asked Farnsworth, biting into a black cigar.

"Damned weird, isn't it?" replied "Old Perk." "I have my own theory, however," he added, "but I am going to know a whole lot more about this case before I venture it." The pair climbed into Ferguson's car discussing the Darrow death case with furrowed brows.

What might be termed an extraordinary meeting of the directors of the Schefert Engineering Corporation, was held a few days later in a big building in the financial district.

The rich furnishings of the directors' room indicated, better than Bradstreet's, the great wealth of the corporation. Uniformed pages stood at attention at each end of the long, mahogany table at which were seated the fourteen directors of the company. All were men of wealth, standing and engineering knowledge.

The departed Darrow often had been summoned to such meetings, and at this one there was a hush because of his recent demise.

After a batch of preliminary business had been transacted, Ferguson arose and cleared his throat. The directors leaned forward in their chairs expectantly. The page boys lost their mechanical attitude for the instant and fairly craned their necks around the bulks of the forms in front of them.

"The Darrow case has taken a sudden and sinister turn," said the president. "I have a letter. I will read it:

"Old Perk: Get wise to yourself. We are in a position to destroy you and all the pot-bellies in the Wall Street crowd. If you want to die of old age, remember what happened to Darrow and begin declaring us in on Wall Street dividends. If you do not you will follow Darrow in the same way.

"Our first demand is for \$100,000. Leave this

amount in hundreds and fifties in the rubbish can at the corner of 50th Street and Broadway at 10 A. M. next Thursday. If you fail we will break your damned neck. Bring the police with you if you like.

Invisible Death.

Ferguson passed the letter around for inspection. It was painstakingly printed, evidently from the type in a rubber stamp set such as is sold in toy stores.

"I have decided," said Perkins at length, "to give this case to Walter Lees. He has never failed us in mechanical, chemical, or any form of scientific problem. I hope he will not fail in this. He will work independently of the police, who have requested that we keep the appointment at 50th Street and Broadway at the hour named. We will deposit a roll of newspapers, around which has been wrapped a fifty dollar bill and then we will stand by while the awaiting detectives do their duty."

"You do not think anyone is going to call for any

supposed package of money at one of the most congested corners in the world in broad daylight?" asked a director at the end of the table.

"Why not?" asked Ferguson. "A seedy individual could pick a package from a rubbish bin at that corner without attracting the least attention."

"I guess you're right," agreed the doubting one.

"I know I'm right," said the president. And he usually was.

"I have already arranged to have Lees instructed in his work," Ferguson volunteered as a pause came in the buzz of conversation about the table. "Lees is young, but he is capable." There was general discussion of the strange case of Darius Darrow; the room filled with the blue haze of many cigars.

Suddenly a low, humming sound was heard in the room.

Papers on the directors' table were bunched as if by

unseen hands, and thrown to the ceiling, from which they descended like flakes of snow and scattered about the room.

A book of minutes was torn from the hands of a secretary. It was raised and brought down on vice-president Farnsworth's head. A chair was pulled out from under another director and he was deposited in an undignified heap on the floor.

Another director acted as though he had been tripped, and he fell on top of Farnsworth. Two big vases crashed to the floor in bits. Other decorative objects were scattered about.

The directors who had been hurtled to the floor stood up with expressions of comical surprise on their features. Their chairs catapulted into a far corner of the room, one after the other.

Startled expressions resounded from the group.

A small bookcase fell on its front with a crash of glass. Ferguson's cane jumped in the air and crashed a

window pane.

The humming ceased suddenly.

The room was a wreck. The assembled men stood aghast. They were simply nonplussed. Finally they phoned for the police.

After hearing the strange recital from so many highly reputable witnesses, a detective sergeant, who had responded to the call with others, reported to headquarters.

A uniformed police guard was sent to the place with instructions to remain on duty until relieved.

Ferguson sent for Walter Lees, the young engineer of whom he had spoken to the directorate. Assigned to the task of unraveling the Darrow death mystery, Lees ran true to form by getting busy at once. This was at midnight of the day of the surprising directors' meeting. Lees owned a big car; he piled into it and started for the scene of the crime.

Daybreak found him examining every inch of the road around the Darrow estate. Then he searched the hedge along the east road, where the phantom auto had disappeared after the crime. The brush along the opposite side of the thoroughfare was also gone over.

Passing autos had stopped to ask the meaning of his flashlight. Lees explained he had lost a pocketbook. It was as good an excuse as any and served to keep him from drawing a crowd. He found nothing to reward his long and painstaking efforts.

At seven A. M. he decided to interview the Darrow widow, and found her already up and about her kitchen, weeping softly as she worked.

She bade him be seated in the living room.

"No, I am not afraid to stay here alone," she said in reply to Lees' first question. "Whoever killed my husband did so to get possession of his second model. They had already stolen the first. I have thought since that they were afraid that the finding of the second model after his death would aid in their detection. For

some reason they had to have both models."

She agreed to tell all she knew of the case. Lees listened to the long recital as already recorded at the coroner's inquest. By adroit questioning Lees gained just one new fact. Mrs. Darrow remembered that she had called her husband, just before he retired to his laboratory, to fix a towel hanger in the kitchen. "He found the pivot needed oiling," explained the widow. "That was all. He oiled it and went into the laboratory."

The idea of one of the world's greatest mechanical engineers stopping his work to oil a towel hanger caused Lees to smile, but Mrs. Darrow did not smile.

"My husband was a genius at repairing about the house," she said, in all seriousness.

"I can imagine so," agreed Lees.

The conversation ceased. Lees sat for a few minutes with his head in his hands, thinking deeply. Finally he said:

"I am convinced that someone who was well aware of your husband's habits committed this crime. Do you believe, positively, that the gardener is above suspicion?"

"Oh, it couldn't have been Peck," insisted Mrs. Darrow. "I had seen him down near the gate from the window. He was too far from the house, and besides, he was devoted to us both."

"Then it was somebody from the neighborhood," said Lees.

"Maybe so," replied Mrs. Darrow, noncommittally.

"Who lives in the next house south?"

"That is towards the city," mused the widow. "There are no houses south on either side of the road for a little further than a mile, when you reach the town limits of Farsdale. The town line is about half-way between, and marks the southern end of this estate."

"Who lives in the first house to the north?"

"That is the cottage of Peck, the gardener."

"How near is the next house?"

"That was the parcel my father sold. It is about three acres, and in the center, or about the center, is the house built by Adolph Jouret, who bought the land. He lives there with his daughter. They built a magnificent place. The brook that traverses our grounds rises at a spring back of his house. Save for two West Indian servants, they are alone. The servants live in Farsdale and motor back and forth."

"What do you know of this—what's his name?"
queried Lees, who had assumed the role of examiner.

"Jouret? Very little. He is some sort of a circus man or showman, or was before he retired. He once had wealth, but my husband, some weeks ago, said that because of ill-advised investments he was not so well rated as formerly. I had the feeling that he might be forced to give up the place. I just felt that. I never heard it. I am so sorry because of the daughter. She is a beautiful girl, and seemed kindly, the one time I saw

her. She was about twelve then. I do not like to say it, but she seemed a little dazed or slow witted, but really beautiful." Mrs. Darrow fell to smoothing out the folds in her house apron as Lees asked:

"When was the only time you saw her?"

"Ten years ago, about. Just after my father's death. They called on us. We did not care to continue the friendship, as Jouret seemed a little flamboyant—his circus nature, I suppose. Anyway, we were quiet folks, and there was no need of close association with neighbors.

"I remember," continued the widow, after a pause, "that Jouret, when he heard my husband was a scientist, simulated an interest in science. He did have a smattering knowledge of science, but he was plainly affected, so we decided to just let him drop. No ill-feeling. We just—well, we were not interested."

"You do not approve of circus people?"

"It is not that. Any honest work is honorable. It seems

commendable to furnish amusement for the public. I know little about people of his profession but I am sure they are perfectly all right. It was Jouret, personally. He seemed noisy and insincere. The girl was nice. I loved her."

"That is all you know of the Jourets?"

"That is all."

"Mrs. Darrow, I wish to go through this house from attic to basement. Have you any objections?"

"None whatever. Make yourself free, but do not attach any significance to what appears to be a secret passageway and cave. My father was a biological chemist. He used to experiment much with small animals. He had a cave where he stored chemicals, and I believe you will find old chemicals stored down there now. I disturbed nothing."

The widow forced a smile to her lips. "Will you excuse me?" she concluded. "I am trying to carry on."

Lees, carrying a flashlight, began a systematic search of the premises. He made his way up a winding staircase, through dust and cobwebs to the attic. He found the top story filled with trunks and bits of furniture of a previous generation. All was in order, but dust-covered and cobwebby.

"Someone has been here before me," he said to himself, brushing a mist of cobwebs from his coat sleeves. "There is a path brushed through the spiderwebs." Turning his flashlight on the floor, he exclaimed:

"And here are footprints in the dust. Well I'll be—!"

Then, after some study, he mused:

"Of course there has been someone here. The killer of Darrow probably has been here to see what he could see. It was no great task. The doors were never locked. The footprints are of no value except to give me the size of his shoes."

He measured the footprints carefully. Then he went

downstairs and phoned the measurements to a local shoe dealer, asking him to give him the trade size of shoes which would make such prints.

"They are number nines," decided the shoe dealer.

Lees then returned to resume his search in the rooms and corridors.

"Wonder if Jouret wears nines," he questioned himself. "But what if he does? I couldn't convict him on that score. However, it might help."

Then he fell to searching through the old trunks. He found old photographs, articles of apparel, knickknacks—grandmother's and grandfather's belongings all of them, and some children's clothes of the days when little boys wore ruffles about their necks and little girls' pantalettes reached to their ankles.

Carefully each article was replaced. He made his way down to the third and then the second floor. Through cobwebby corridors and bedchambers he searched, but found nothing further to aid his case.

In the unused rooms on the first floor he found an old spinning-wheel, candle moulds and utensils used in cooking in the days when housewives cooked over an open fire.

He did not find the "secret" passageway until Mrs. Darrow came to his aid. Leading from the basement was a coal chute. This shoot was formed in a triangle with the point under a trap. It was man-high at the cellar opening and its floor was a slide for fuel. It had been in use, evidently, quite recently.

At the cellar wall of this chute, Mrs. Darrow pressed what appeared to be a knot in the old timber and pushed open a door.

A dank odor issued forth as the door was opened. Lees entered the passage and Mrs. Darrow returned upstairs.

Following the underground passageway, Lees came onto a cave about 14 by 14 feet in size with a ceiling and walls of arched brick. It had evidently been built before the days of cement construction.

A long bench and shelves with carboys and jars of chemicals were the only furnishings. Lees sounded all the walls, but found nothing further to interest him.

Lees returned to town at the urgent call of "Old Perk," who had arranged with great care to keep the appointment at 50th street and Broadway, where the decoy package was to be left. He had snipers in nearby windows. He had detectives, dressed in the gay garb of the habitues of the neighborhood, patrolling the corner, and he and his own guard parked an automobile, against all traffic rule, at the curb near the rubbish can.

An office boy sauntered up to the rubbish can, threw in the decoy package, and sauntered away.

A second later there was a low humming sound. The decoy package fairly jumped out of the rubbish can and disappeared in thin air.

The humming sound seemed to round the corner into 50th Street. Detectives followed on the jump. The humming approached an auto at the curb and the

auto's self starter began to function. As the police stood near by, enough to have jumped into the auto, the whole machine, a big touring car, actually disappeared before their eyes.

Consternation is a mild word when used to describe the result.

All forces set to trap the extortionists gathered in a group, and in their surprise and disappointment began discussing the queer case in loud tones. A crowd was gathering which was blocking traffic.

"Old Perk" was the first to recover from his surprise.

"Get the hell out of this neighborhood," he yelled to his working forces. "All of you get down to my office!"

The working force dissolved and "Old Perk" drove away.

At "Old Perk's" office shortly afterward a conference of the defeated forces of the law and of science was held.

"Old Perk" stormed and raged and the detective captain in charge fumed and fussed, but nothing came of it all. One was as powerless as another. Finally the conference adjourned.

The next morning in the mail, Perkins Ferguson, president of Schefert Engineering Corporation, received a letter carefully printed in rubber type. It read:

Thanks for the \$50 bill. You cheated us by \$99,950. This will never do. Don't be like that. You poor fools, you make us increase our demand. We double it. Leave \$200,000 for us on your desk and leave the desk unlocked. We will get it. Every time you ignore one of our demands, one of your number will die. Better take this matter seriously. Last warning.

Invisible Death.

"Not another dime will they get out of me," mused Ferguson.

He started opening the rest of his mail.

A clerk entered and handed him a telegram. It read:

"Damon Farnsworth struck down at breakfast table. Family heard humming sound as he fell from his chair. Removed to Medical Center. Skull reported fractured. May die.

"William Devins, Chief of Police, Larchmont."

Ferguson wildly seized the telephone. "Get me Farnsworth's house at Larchmont!" he shouted to his operator.

The phone was answered by Jones, the butler.

"This is Ferguson."

An agitated voice replied:

"Ow sir, yes sir. It's true, sir. 'E was bleeding at the 'ead, sir. Something 'it 'im."

"Let me talk to Mrs. Farnsworth."

"They are at the 'ospital, sir."

"One of the boys."

"Both are at the 'ospital, sir."

"Do you think he will live?"

"An' 'ow could I say, sir?"

Ferguson called the Medical Center. They permitted him to talk to a doctor and a nurse. The nurse referred him to the doctor, who said:

"He is unconscious. There is a wicked fracture at the base of the brain. He was struck from the back—a club, I believe. He may die without regaining consciousness. I am hoping he will rally and that he will be all right."

Ferguson ordered his car and, with Lees at his heels, jumped in the tonneau. He heard a humming sound back of him. He looked back and saw nothing. Both he and Lees were too impressed for words.

"Step on it," Ferguson ordered the chauffeur. "Drive us to the Medical Center."

At the world's largest group of hospitals, Ferguson's worst fears were confirmed. The patient was reported sinking.

Ferguson, giant of Wall Street, was a low spirited man as he drove back down town to his office. With Lees he passed through the outer offices, buzzing with business and the click of typewriters. Not a head was raised from a desk or machine. It was a well-drilled force.

Into his private sanctum he walked or rather dragged himself, and wearily he sat down. He pushed a pile of papers from him and ran his hand over his hot brow.

Blood pounded at his temples.

For the first time in his life he faced a situation which was too deep for his understanding.

Over and over again he reviewed the uncanny events

as Lees sat awaiting orders.

"I cannot have them killing off my friends like that," he mused finally.

He called a clerk.

"Go to the bank and get \$200,000 in fifties and one hundreds," he commanded.

When the clerk returned with the money he laid the package on his desk and left the desk open. "This might appear cowardly, but it will give us time," he said. Lees did not offer an opinion.

Ferguson drew a personal note for \$200,000 and sent it to the Schefert Corporation's attorneys. This amount represented a large part of Ferguson's personal assets, not involved with any company with which he was connected. He told Lees to go about his further investigations. Then he left the office and started for his home. "I'll bank my life Lees will have those crooks lined up within a week," he assured himself as he lolled in his auto, bound homeward. But

his voice sounded hollow, and the blood still pounded at his temples.

Reaching home, he found a call from the western plant, at Chicago. He phoned the superintendent with a foreboding that all was not well.

"This you, Perk?" sounded the voice on the wire.

"Yes, what's up?"

"I had not intended bothering you with this, but in the light of all that has happened I guess you had better know that one of our engineers went stark mad out here about three weeks ago. He was a very brainy man but his reason snapped. He first appeared queer when he began talking of anarchy and cursing capitalists. Then one afternoon he struck a shop foreman down with a heavy wrench and rushed out of the plant. We have not seen him since. The police have been looking for him, but he is still at large."

"That explains a lot of things," said "Old Perk." "Tell the police to keep after him. We'll look for him here."

File me a complete detailed report of the incident by telegraph," he instructed. Then he asked:

"How is the foreman? Badly hurt?"

"He dodged; it was a glancing blow. The foreman was back to work in a week. But he is nervous and has armed himself. We have put on extra guards."

"Good," commended Ferguson. "Don't hesitate to spend tolls to keep me advised of any developments."

An hour and a half later, Ferguson phoned the chief clerk in his offices:

"Go into my private office," he ordered, "and see if there is a package on my desk. It is a bank package."

The clerk returned in a few moments.

"There is no package on your desk, Mr. Ferguson."

"That is all I wanted to know," said Ferguson, and hung up the receiver.

Then Ferguson called up the Darrow home and tried to get in touch with Lees, but was unable to do so, as Mrs. Darrow said she had not seen him since he had been called back to the office.

The reason Ferguson could not reach Lees was because Lees had decided to learn once and for all if Jouret wore number nine shoes. He had started for Jouret's in his own car. It was a beautiful country he was traversing, but he had no time to note that the tree branches almost met over his head and that his way was bordered with a profusion of wild flowers, displaying a rainbow of colors.

The house of Jouret, the retired circus performer, sat back far from the road, against the side of a beautiful hill, and was surrounded by poplars. The landscape was wilder and more natural than that of the Darrow place adjoining.

The door was opened by a Porto Rican boy. Lees lost no time. He said bluntly:

"Tell your master that a gentleman is here to see him

on very particular business."

Jouret, himself, came back with the boy.

"What is it?" he asked, smiling a welcome.

"I am working on the case of the death of Mr. Darrow, your neighbor. I believed you might have seen something. I thought you might aid me."

Jouret betrayed no surprise.

"Come in," he said. He led the way to a large reception room and asked his visitor to be seated. He was the soul of affability. Short, husky and florid. His eyes large, black and staring. His hair black, quite long and curling upward at the ears. He was dressed in black, and he had the appearance of a big, fat crow.

"I am glad you came," he greeted his guest, "for I have far too few callers." He switched on a big electric bunch-light in the center of the room, for it was dusk.

"We have been told that you are a retired circus man," said Lees, in his usual frank manner.

"Not exactly," said Jouret. "I traveled on the continent, finally journeying to Australia and then to the States. I crossed the country from San Francisco and settled down here. I was known as 'Elias, the Great.' I had my own company and property. It was a magic show. It was not a circus, although we did carry two elephants, three camels, some ponies, snakes, and birds and smaller animals. That's where the circus report came from.

"When I retired I sold my stock to a circus. The newspapers regarded it as funny, and one of them printed a half page story with pictures about the public sale. It was very much exaggerated. They mentioned giraffes, hyenas, and a lot of other animals I never possessed. Odd, wasn't it, getting so much publicity after I was through needing it? However I never, in those days, dodged the limelight." Jouret ended his speech with a loud and hearty guffaw.

"I will call my daughter," Jouret appended. "She will

be glad to meet you." He left the room.

Lees had taken occasion to note the size of Jouret's feet. They were small, almost effeminate. More likely fives or sixes than nines.

Soon Jouret returned with a girl in her early twenties. She was blond and radiantly beautiful.

Doris Jouret bowed and smiled in a perfectly friendly manner. Lees noted that there was something about her eyes that made her appear dazed.

Jouret monopolized the conversation, giving no one a chance to edge in a word.

"This gentleman desires information in connection with the death of our neighbor Mr., or is it Dr., Darrow? I want you to assure him, as I will, that we have seen or noted nothing that could possibly throw light on the strange case."

The girl nodded, it seemed a little wearily, and Jouret was off on another conversational flight:

"I too am a man of scientific attainments," he chattered. "I am a biologist, toxicologist, doctor of medicine, a geologist, metallurgist, mineralogist, and somewhat of a mechanic and electrician. I have given long hours to the study of strange sciences in metaphysics, to which you men give too little attention. There are sciences which transcend any of this sphere. There is a higher astronomy. I neglected to say that I am an astronomer."

"Yes?" drawled Lees.

"Yes!" said Jouret emphatically.

The girl had adopted rather a theatrical pose, which disclosed considerable of her nether charms, and said nothing at all.

"When you find your man," volunteered Jouret, "you will find a madman." He said this ponderously and with a gesture meant evidently to be impressive.

"You believe a madman did it?" asked Lees, as Jouret paused, expecting a question.

"Undoubtedly. It was a paranoic with delusions of money, grandeur and a strongly developed homicidal mania. To me, that is the only sensible solution. I am quite sure that I am correct."

Lees arose to go and Jouret did not urge him to stay. He bowed Lees out and Doris bowed with him.

"She is a beautiful girl," mused Lees once he was outside.

Lees ran over in his mind the circumstances of his visit to Jouret. There was no doubt in his mind that Jouret's shoes were too small to be number nines, and he reasoned that that fact might tend to eliminate Jouret. But he was not satisfied.

"I am going to get some gas," he told himself, "and then I am going to get two private detectives to assist me, for I'm going right back there. For the first time in my life I am going to be a Peeping Tom."

"There is no moon. The poplars will give us a view of all three floors of that house, if they leave their blinds

up enough, and three of us can watch all three floors at once."

He phoned Ferguson that he might be busy for days, joined his pair of operatives from the detective agency and for some time the three operated on a well conceived plan.

It was probably a week later that Lees rendered a report to Perkins Ferguson, which for a time proved one of the strangest documents in the weird case. It read:

"You will probably think I am crazy, and for this reason I am having this report subscribed and sworn to, jointly and severally. With my two detectives I have seen Miss Jouret, the girl I told you about over the phone, in three places at one and the same time. Not once but twice this has happened.

"Looking through the windows of the Jouret place at night, we saw the girl on the first, second and third floor of the house. We believed this due to a clever arrangement of mirrors. But figure this out:

"The next day she drove a car to town. We followed. She got out at one theater and entered. She did not come back, that we could see, but the car drove off. There was no chauffeur, and we thought we had discovered the driverless auto, until we looked and saw Miss Jouret still at the wheel.

"She got out and entered another theater. She did not come back, but the car drove off with her still at the wheel. She entered a third theater after parking the car and this time the driver's seat and the tonneau was empty.

"Reverse the reel and you will see her coming out of three theaters and driving home. That is what happened. There must be three of her, all identical, but only one shows at a time. If it's some of Jouret's far-famed magic, I'll say he's some conjurer. The explanation is not yet forthcoming. We want to shadow Jouret, but he never goes anywhere. The girl has only been out the one time when she attended three matinees as described. Believe it or not.

"The next night we each—the two detectives and I—

tried to steal a march on one another and called her up and asked her to go out. To our individual surprise, she agreed in each case. To our collective surprise, she kept all three dates on the same night. She walked through the trees in this vicinity with me. She also drove down the road in the auto with one of my detectives, and she went dancing with the other. She was in three places miles apart at one and the same time.

"We each brought her home within a half hour of the other and we are swearing to that. Either we are all hypnotized or else there are three identical Misses Jouret.

"Jouret himself treats us all wonderfully, gives us the run of the house, and tries to talk us to death."

The strange document was subscribed by Lees and the two detectives and was held by Ferguson pending developments.

The next report from Lees read:

"I had a chance to prowl around the Jouret house a little while waiting for Miss Jouret to dress. I met her twice in my ramblings and a few minutes later she met me again, this time in a different costume.

"I got a chance to search the woods back of Jouret's house in the evening. I found a spot where the earth had been disturbed, and dug up a pair of shoes. They were number nines."

A fourth report from him read:

"We found the body of the crazed engineer. He had drowned himself in a lake. This eliminates him as a murder suspect."

Two weeks passed with no new developments in the "Invisible Death" case except for the arrival of a letter demanding \$1,000,000 and threatening the life of Perkins Ferguson if the demand was ignored. It was ignored, and only served to spur Lees and his detectives on to decisive action.

They decided to rush the Jouret house and kidnap

Jouret with the idea of holding him until he agreed to explain the presence of the number nine shoes buried back of his house.

A low moon hung over the poplars when Lees rang the Jouret front door bell. One detective was guarding a side door and the other a back door.

Suddenly Jouret was seen to jump from a second-story window. As he did, a car driven by one of his Porto Ricans came along the drive and he leaped into it. Lees, first to see Jouret, called his detectives. They came running. Their car was waiting in the road.

The Porto Rican was seen to jump from the Jouret car just as it started south towards New York.

Lees took up the race. Both cars had plenty of power, but the Jouret car suddenly disappeared as a low humming noise began to break the stillness of the night.

One of the detectives was at the wheel. Lees, as usual, was giving orders:

"Keep close to that hum. Never mind that you cannot *see* the car. It is there all right. If you can gain on it enough, drive right into it."

"Righto!" shouted the detective. "We're wise to him now."

The humming noise was taking on speed with every second. So was Lees' car. Soon Lees' car was making sixty miles an hour with the hum just ahead and barely audible.

Past traffic lights, over bridges and grade crossings the mad chase of the phantom continued.

Wildly racing through the night, missing other cars by a breath, the big, visible auto continued its pursuit of —what?

[Image description start: A black and white illustration showing the headlights of an invisible car cutting through the darkness, pursued by another car with light reflecting off the roof and corners. Image description end.]

Careening, Lees' car rounded a curve, and, above the hum just ahead, they heard the shouted curses of their quarry. But he could not be seen. Lees could only see the road marked by his lights.

Mile after mile the wild, uncanny chase of the phantom continued.

Soon the lights of New York could be seen in the distance. The cars were forced to slow down somewhat. Suddenly there was a thundering crash ahead. A car was twisted in a mass of tangled wreckage.

Feminine and masculine shrieks blended as Lees' car piled up on the wrecked heap. A third car, becoming suddenly visible, rolled over and brought up at the edge of the road. From this car emerged the limping, cursing form of Jouret.

From the wreckage three painfully injured young men dragged and tore themselves. Then they leaped—ignoring their hurts—at the limping figure.

The fight was on. Jouret was heavy and powerful and proved an obstinate fighter, for he knew he was fighting for his life. He bit and clawed. He kicked with one uninjured leg and butted with his massive head.

Lees and his detectives were fighting with no respect for the rules. Lees managed to get his two hands on the bull-neck of Jouret just as one detective connected a duet of blows to the man's wind.

Lees' hands closed in a steely grip, and soon Jouret was limp and helpless.

They held him there. An ambulance arrived. A few minutes later a police auto with reserves came on the scene. The police shackled Jouret.

The car that had been hit by the phantom was a light sedan. It was occupied by two women. Their bodies were drawn from the wreckage. Both were dead—innocents sacrificed to the blood madness of a maniac.

Jouret was right about himself. He was a paranoid

with a strongly developed homicidal mania.

In the wreckage was found a package containing \$200,000 and also two twisted and broken mechanisms. One of these was about the size of an ordinary kitchen coffee-mill, and the other slightly larger.

Regarding these machines, Lees wrote in a report:

"While making a fourth search of Darrow's laboratory, I found the equations, specifications and what I believe to be the full plans for the last invention of the ingenious Darius Darrow.

"Many of the most astounding inventions and discoveries have resulted from theories which were laughed to scorn at the time they were advanced. Roebling's plans for the Brooklyn Bridge resulted in a meeting of the foremost engineers of the day. All agreed that the plans were built on a false premise. They argued that the bridge would fall of its own weight. Then they all had a good laugh. The bridge still stands.

"Watching smoke float over a hill from army camp fires caused an early French scientist to dream of filling a bag full of smoke and riding with it over the hill. The first balloon was the answer to this dream.

"James Watt is said to have gotten his idea for a steam engine from watching a lid on a tea-kettle dance under steam pressure.

"When Langley was flying his man-carrying kites the Wright brothers dreamed of hitching an engine and a propeller to a giant kite. The airplane was the result of these experiments.

"Darrow got his idea from watching a rapidly revolving wheel. He noticed that the spokes and rim blended into a blurred disc when a certain speed was reached. The entire wheel was practically invisible, under certain lighting conditions, when a higher speed was attained.

"Darrow went further and reached the conclusion that there was a rate of vibration that would produce invisibility. This was accepted in practically all

engineering research plants, long before it was perfected by Darrow.

"The facts are that any rapidly vibrating object becomes more and more difficult to outline as its rate of vibration increases. All that was left for Darrow was to arrive at the exact mathematical time, tone, or rate of vibration producing invisibility and to construct a vibrator tuned to produce this condition.

"His first machine produced the vibrations of invisibility in a field with a three-foot radius in all directions. That is, it caused every solid object, within this atmospheric field, to vibrate at the rate, tone, or speed of invisibility. This machine was in no sense rotary. It departed from the original example of a revolving wheel and entered instead into general vibration in a given or measured field.

"The pulsations or vibrations of an ordinary automobile engine will cause every ounce of metal, or solid, in the automobile—including the driver—to vibrate at the same rate or momentum. This is a known fact, and it provided the basis for Darrow's

experiments.

"Darrow built two machines. The first had a field with a radius of three feet on all sides. This was used by the killer in his murders. Jouret stole this machine first, thus paving his way for the second robbery.

"With the first machine in his possession, Jouret was able to commit the Darrow murder without being seen. He had to have the second and larger machine, however, to make his auto disappear. He stole the larger machine at the time of the Darrow murder, and with it he had his auto vanish, as the gardener testified.

"Both machines were hopelessly smashed in the wreck, but with Darrow's documents at hand, we might be able to construct another and a larger model. A machine built on the proper scale will make a plane or a battleship invisible and should, as Darrow said, make war against this country impossible.

"Digging into Jouret's history we found that the

'Misses Jouret' were one-cell triplets. Their mother, Mrs. Doris Nettleton, an English woman, was a member of Jouret's troupe, as was the father.

"The mother died at the birth of the triplets. The father died a few years later. The company was touring Australia at the time. Jouret and the father had the birth of only one baby recorded. She was named Doris, after the mother. The other girls also used this one name. They now have only one name among them until the court gives them individual names.

"Jouret never let but one girl be seen at a time. The reason was that he and the father had planned to use the girls, when grown, to create a surprising stage illusion. In this illusion, one girl was to act as the earthly body and the other girls as the astral bodies of the same purported individual.

"The father died, and Jouret retired before he ever got around to staging the illusion. Jouret continued the deception, however, because it appealed to his showman's nature.

"The girls, at all times, were under the hypnotic control of Jouret, and, of course, knew nothing of his crazed intellect or crimes. Upon his arrest Jouret released the girls from the spell of years.

"The Misses Nettleton say that Jouret was always kind to them and was an ethical showman until his mind gave way.

"I told the triplets that I might find them employment with our concern, but they prefer to follow in the footsteps of their mother and father, and return to the stage."

Ferguson, quite his normal self once more, since Farnsworth was recovering slowly, twitted Lees about being in love with one of the triplets. Lees admitted they were most gorgeous blondes, but insisted he preferred one brunette.

"Then another thing," added Lees. "Any man who falls in love with one of the Nettleton triplets will never be sure just which one he fell in love with."

February 1930

#08 Old Crompton's Secret, by Harold Vincent Schoepflin:

Tom's extraordinary machine glowed—and the years were banished from old crompton's body. But there still remained, deep-seated in his century-old mind, the memory of his crime.

Aproximate word count: 7,800

Bigotry:

Warnings:

- - -

Two miles west of the village of Laketon there lived an aged recluse who was known only as Old Crompton. As far back as the villagers could remember he had visited the town regularly twice a month, each time tottering his lonely way homeward with a load of provisions. He appeared to be well

supplied with funds, but purchased sparingly as became a miserly hermit. And so vicious was his tongue that few cared to converse with him, even the young hoodlums of the town hesitating to harass him with the banter usually accorded the other bizarre characters of the streets.

The oldest inhabitants knew nothing of his past history, and they had long since lost their curiosity in the matter. He was a fixture, as was the old town hall with its surrounding park. His lonely cabin was shunned by all who chanced to pass along the old dirt road that led through the woods to nowhere and was rarely used.

His only extravagance was in the matter of books, and the village book store profited considerably by his purchases. But, at the instigation of Cass Harmon, the bookseller, it was whispered about that Old Crompton was a believer in the black art—that he had made a pact with the devil himself and was leagued with him and his imps. For the books he bought were strange ones; ancient volumes that Cass must needs order from New York or Chicago and that cost as much as

ten and even fifteen dollars a copy; translations of the writings of the alchemists and astrologers and philosophers of the dark ages.

It was no wonder Old Crompton was looked at askance by the simple-living and deeply religious natives of the small Pennsylvania town.

But there came a day when the hermit was to have a neighbor, and the town buzzed with excited speculation as to what would happen.

he property across the road from Old Crompton's hut belonged to Alton Forsythe, Laketon's wealthiest resident—hundreds of acres of scrubby woodland that he considered well nigh worthless. But Tom Forsythe, the only son, had returned from college and his ambitions were of a nature strange to his townspeople and utterly incomprehensible to his father. Something vague about biology and chemical experiments and the like is what he spoke of, and, when his parents objected on the grounds of possible explosions and other weird accidents, he prevailed upon his father to have a secluded laboratory built for

him in the woods.

When the workmen started the small frame structure not a quarter of a mile from his own hut, Old Crompton was furious. He raged and stormed, but to no avail. Tom Forsythe had his heart set on the project and he was somewhat of a successful debater himself. The fire that flashed from his cold gray eyes matched that from the pale blue ones of the elderly anchorite. And the law was on his side.

So the building was completed and Tom Forsythe moved in, bag and baggage.

For more than a year the hermit studiously avoided his neighbor, though, truth to tell, this required very little effort. For Tom Forsythe became almost as much of a recluse as his predecessor, remaining indoors for days at a time and visiting the home of his people scarcely oftener than Old Crompton visited the village. He too became the target of village gossip and his name was ere long linked with that of the old man in similar animadversion. But he cared naught for the opinions of his townspeople nor for the dark

looks of suspicion that greeted him on his rare appearances in the public places. His chosen work engrossed him so deeply that all else counted for nothing. His parents remonstrated with him in vain. Tom laughed away their recriminations and fears, continuing with his labors more strenuously than ever. He never troubled his mind over the nearness of Old Crompton's hut, the existence of which he hardly noticed or considered.

It so happened one day that the old man's curiosity got the better of him and Tom caught him prowling about on his property, peering wonderingly at the many rabbit hutches, chicken coops, dove cotes and the like which cluttered the space to the rear of the laboratory.

Seeing that he was discovered, the old man wrinkled his face into a toothless grin of conciliation.

"Just looking over your place, Forsythe," he said.

"Sorry about the fuss I made when you built the house. But I'm an old man, you know, and changes are unwelcome. Now I have forgotten my objections and

would like to be friends. Can we?"

Tom peered searchingly into the flinty eyes that were set so deeply in the wrinkled, leathery countenance. He suspected an ulterior motive, but could not find it within him to turn the old fellow down.

"Why—I guess so, Crompton," he hesitated: "I have nothing against you, but I came here for seclusion and I'll not have anyone bothering me in my work."

"I'll not bother you, young man. But I'm fond of pets and I see you have many of them here; guinea pigs, chickens, pigeons, and rabbits. Would you mind if I make friends with some of them?"

"They're not pets," answered Tom dryly, "they are material for use in my experiments. But you may amuse yourself with them if you wish."

"You mean that you cut them up—kill them, perhaps?"

"Not that. But I sometimes change them in physical form, sometimes cause them to become of huge size,

sometimes produce pigmy offspring of normal animals."

"Don't they suffer?"

"Very seldom, though occasionally a subject dies. But the benefit that will accrue to mankind is well worth the slight inconvenience to the dumb creatures and the infrequent loss of their lives."

Old Crompton regarded him dubiously. "You are trying to find?" he interrogated.

"The secret of life!" Tom Forsythe's eyes took on the stare of fanaticism. "Before I have finished I shall know the nature of the vital force—how to produce it. I shall prolong human life indefinitely; create artificial life. And the solution is more closely approached with each passing day."

The hermit blinked in pretended mystification. But he understood perfectly, and he bitterly envied the younger man's knowledge and ability that enabled him to delve into the mysteries of nature which had

always been so attractive to his own mind. And somehow, he acquired a sudden deep hatred of the coolly confident young man who spoke so positively of accomplishing the impossible.

During the winter months that followed, the strange acquaintance progressed but little. Tom did not invite his neighbor to visit him, nor did Old Crompton go out of his way to impose his presence on the younger man, though each spoke pleasantly enough to the other on the few occasions when they happened to meet.

With the coming of spring they encountered one another more frequently, and Tom found considerable of interest in the quaint, borrowed philosophy of the gloomy old man. Old Crompton, of course, was desperately interested in the things that were hidden in Tom's laboratory, but he never requested permission to see them. He hid his real feelings extremely well and was apparently content to spend as much time as possible with the feathered and furred subjects for experiment, being very careful not to incur Tom's displeasure by displaying too great

interest in the laboratory itself.

Then there came a day in early summer when an accident served to draw the two men closer together, and Old Crompton's long-sought opportunity followed.

He was starting for the village when, from down the road, there came a series of tremendous squawkings, then a bellow of dismay in the voice of his young neighbor. He turned quickly and was astonished at the sight of a monstrous rooster which had escaped and was headed straight for him with head down and wings fluttering wildly. Tom followed close behind, but was unable to catch the darting monster. And monster it was, for this rooster stood no less than three feet in height and appeared more ferocious than a large turkey. Old Crompton had his shopping bag, a large one of burlap which he always carried to town, and he summoned enough courage to throw it over the head of the screeching, over-sized fowl. So tangled did the panic-stricken bird become that it was a comparatively simple matter to effect his capture, and the old man rose to his feet triumphant with the bag securely closed over the struggling captive.

"Thanks," panted Tom, when he drew alongside. "I should never have caught him, and his appearance at large might have caused me a great deal of trouble—now of all times."

"It's all right, Forsythe," smirked the old man. "Glad I was able to do it."

Secretly he gloated, for he knew this occurrence would be an open sesame to that laboratory of Tom's. And it proved to be just that.

A few nights later he was awakened by a vigorous thumping at his door, something that had never before occurred during his nearly sixty years occupancy of the tumbledown hut. The moon was high and he cautiously peeped from the window and saw that his late visitor was none other than young Forsythe.

"With you in a minute!" he shouted, hastily thrusting his rheumatic old limbs into his shabby trousers.

"Now to see the inside of that laboratory," he chuckled to himself.

It required but a moment to attire himself in the scanty raiment he wore during the warm months, but he could hear Tom muttering and impatiently pacing the flagstones before his door.

"What is it?" he asked, as he drew the bolt and emerged into the brilliant light of the moon.

"Success!" breathed Tom excitedly. "I have produced growing, living matter synthetically. More than this, I have learned the secret of the vital force—the spark of life. Immortality is within easy reach. Come and see for yourself."

They quickly traversed the short distance to the two-story building which comprised Tom's workshop and living quarters. The entire ground floor was taken up by the laboratory, and Old Crompton stared aghast at the wealth of equipment it contained. Furnaces there were, and retorts that reminded him of those pictured in the wood cuts in some of his musty books. Then there were complicated machines with many levers and dials mounted on their faces, and with huge glass bulbs of peculiar shape with coils of wire connecting

to knoblike protuberances of their transparent walls. In the exact center of the great single room there was what appeared to be a dissecting table, with a brilliant light overhead and with two of the odd glass bulbs at either end. It was to this table that Tom led the excited old man.

"This is my perfected apparatus," said Tom proudly, "and by its use I intend to create a new race of supermen, men and women who will always retain the vigor and strength of their youth and who can not die excepting by actual destruction of their bodies. Under the influence of the rays all bodily ailments vanish as if by magic, and organic defects are quickly corrected. Watch this now."

He stepped to one of the many cages at the side of the room and returned with a wriggling cottontail in his hands. Old Compton watched anxiously as he picked a nicked instrument from a tray of surgical appliances and requested his visitor to hold the protesting animal while he covered its head with a handkerchief.

"Ethyl chloride," explained Tom, noting with amusement the look of distaste on the old man's face. "We'll just put him to sleep for a minute while I amputate a leg."

The struggles of the rabbit quickly ceased when the spray soaked the handkerchief and the anaesthetic took effect. With a shining scalpel and a surgical saw, Tom speedily removed one of the forelegs of the animal and then he placed the limp body in the center of the table, removing the handkerchief from its head as he did so. At the end of the table there was a panel with its glittering array of switches and electrical instruments, and Old Crompton observed very closely the manipulations of the controls as Tom started the mechanism. With the ensuing hum of a motor-generator from a corner of the room, the four bulbs adjacent to the table sprang into life, each glowing with a different color and each emitting a different vibratory note as it responded to the energy within.

"Keep an eye on Mr. Rabbit now," admonished Tom.

From the body of the small animal there emanated an

intangible though hazily visible aura as the combined effects of the rays grew in intensity. Old Crompton bent over the table and peered amazedly at the stump of the foreleg, from which blood no longer dripped. The stump was healing over! Yes—it seemed to elongate as one watched. A new limb was growing on to replace the old! Then the animal struggled once more, this time to regain consciousness. In a moment it was fully awake and, with a frightened hop, was off the table and hobbling about in search of a hiding place.

Tom Forsythe laughed. "Never knew what happened," he exulted, "and excepting for the temporary limp is not inconvenienced at all. Even that will be gone in a couple of hours, for the new limb will be completely grown by that time."

"But—but, Tom," stammered the old man, "this is wonderful. How do you accomplish it?"

"Ha! Don't think I'll reveal my secret. But this much I will tell you: the life force generated by my apparatus stimulates a certain gland that's normally inactive in

warm blooded animals. This gland, when active, possesses the function of growing new members to the body to replace lost ones in much the same manner as this is done in case of the lobster and certain other crustaceans. Of course, the process is extremely rapid when the gland is stimulated by the vital rays from my tubes. But this is only one of the many wonders of the process. Here is something far more remarkable."

He took from a large glass jar the body of a guinea pig, a body that was rigid in death.

"This guinea pig," he explained, "was suffocated twenty-four hours ago and is stone dead."

"Suffocated?"

"Yes. But quite painlessly, I assure you. I merely removed the air from the jar with a vacuum pump and the little creature passed out of the picture very quickly. Now we'll revive it."

Old Crompton stretched forth a skinny hand to touch

the dead animal, but withdrew it hastily when he felt the clammy rigidity of the body. There was no doubt as to the lifelessness of this specimen.

Tom placed the dead guinea pig on the spot where the rabbit had been subjected to the action of the rays. Again his visitor watched carefully as he manipulated the controls of the apparatus.

With the glow of the tubes and the ensuing haze of eery light that surrounded the little body, a marked change was apparent. The inanimate form relaxed suddenly and it seemed that the muscles pulsed with an accession of energy. Then one leg was stretched forth spasmodically. There was a convulsive heave as the lungs drew in a first long breath, and, with that, an astonished and very much alive rodent scrambled to its feet, blinking wondering eyes in the dazzling light.

"See? See?" shouted Tom, grasping Old Crompton by the arm in a viselike grip. "It is the secret of life and death! Aristocrats, plutocrats and beggars will beat a path to my door. But, never fear, I shall choose my

subjects well. The name of Thomas Forsythe will yet be emblazoned in the Hall of Fame. I shall be master of the world!"

Old Crompton began to fear the glitter in the eyes of the gaunt young man who seemed suddenly to have become demented. And his envy and hatred of his talented host blazed anew as Forsythe gloried in the success of his efforts. Then he was struck with an idea and he affected his most ingratiating manner.

"It is a marvelous thing, Tom," he said, "and is entirely beyond my poor comprehension. But I can see that it is all you say and more. Tell me—can you restore the youth of an aged person by these means?"

"Positively!" Tom did not catch the eager note in the old man's voice. Rather he took the question as an inquiry into the further marvels of his process.

"Here," he continued, enthusiastically, "I'll prove that to you also. My dog Spot is around the place somewhere. And he is a decrepit old hound, blind, lame and toothless. You've probably seen him with me."

He rushed to the stairs and whistled. There was an answering yelp from above and the pad of uncertain paws on the bare wooden steps. A dejected old beagle blundered into the room, dragging a crippled hind leg as he fawned upon his master, who stretched forth a hand to pat the unsteady head.

"Guess Spot is old enough for the test," laughed Tom, "and I have been meaning to restore him to his youthful vigor, anyway. No time like the present."

He led his trembling pet to the table of the remarkable tubes and lifted him to its surface. The poor old beast lay trustingly where he was placed, quiet, save for his husky asthmatic breathing.

"Hold him, Crompton," directed Tom as he pulled the starting lever of his apparatus.

And Old Crompton watched in fascinated anticipation as the ethereal luminosity bathed the dog's body in response to the action of the four rays. Somewhat vaguely it came to him that the baggy flesh of his own wrinkled hands took on a new firmness and color

where they reposed on the animal's back. Young Forsythe grinned triumphantly as Spot's breathing became more regular and the rasp gradually left it. Then the dog whined in pleasure and wagged his tail with increasing vigor. Suddenly he raised his head, perked his ears in astonishment and looked his master straight in the face with eyes that saw once more. The low throat cry rose to a full and joyous bark. He sprang to his feet from under the restraining hands and jumped to the floor in a lithe-muscled leap that carried him half way across the room. He capered about with the abandon of a puppy, making extremely active use of four sound limbs.

"Why—why, Forsythe," stammered the hermit, "it's absolutely incredible. Tell me—tell me—what is this remarkable force?"

His host laughed gleefully. "You probably wouldn't understand it anyway, but I'll tell you. It is as simple as the nose on your face. The spark of life, the vital force, is merely an extremely complicated electrical manifestation which I have been able to duplicate artificially. This spark or force is all that distinguishes

living from inanimate matter, and in living beings the force gradually decreases in power as the years pass, causing loss of health and strength. The chemical composition of bones and tissue alters, joints become stiff, muscles atrophied, and bones brittle. By recharging, as it were, with the vital force, the gland action is intensified, youth and strength is renewed. By repeating the process every ten or fifteen years the same degree of vigor can be maintained indefinitely. Mankind will become immortal. That is why I say I am to be master of the world."

For the moment Old Crompton forgot his jealous hatred in the enthusiasm with which he was imbued. "Tom—Tom," he pleaded in his excitement, "use me as a subject. Renew my youth. My life has been a sad one and a lonely one, but I would that I might live it over. I should make of it a far different one—something worth while. See, I am ready."

He sat on the edge of the gleaming table and made as if to lie down on its gleaming surface. But his young host only stared at him in open amusement.

"What? You?" he sneered, unfeelingly. "Why, you old fossil! I told you I would choose my subjects carefully. They are to be people of standing and wealth, who can contribute to the fame and fortune of one Thomas Forsythe."

"But Tom, I have money," Old Crompton begged. But when he saw the hard mirth in the younger man's eyes, his old animosity flamed anew and he sprang from his position and shook a skinny forefinger in Tom's face.

"Don't do that to me, you old fool!" shouted Tom, "and get out of here. Think I'd waste current on an old cadger like you? I guess not! Now get out. Get out, I say!"

Then the old anchorite saw red. Something seemed to snap in his soured old brain. He found himself kicking and biting and punching at his host, who backed away from the furious onslaught in surprise. Then Tom tripped over a wire and fell to the floor with a force that rattled the windows, his ferocious little adversary on top. The younger man lay still where he had fallen,

a trickle of blood showing at his temple.

[Image description start: A black and white illustration showing Old Crompton with his hands around Tom's neck and Tom falls over backwards, as they stand in a dark, crowded lab. End image description.]

"My God! I've killed him!" gasped the old man.

With trembling fingers he opened Tom's shirt and listened for his heartbeats. Panic-stricken, he rubbed the young man's wrists, slapped his cheeks, and ran

for water to dash in his face. But all efforts to revive him proved futile, and then, in awful fear, Old Crompton dashed into the night, the dog Spot snapping at his heels as he ran.

Hours later the stooped figure of a shabby old man might have been seen stealthily re-entering the lonely workshop where the lights still burned brightly. Tom Forsythe lay rigid in the position in which Old Crompton had left him, and the dog growled menacingly.

Averting his gaze and circling wide of the body, Old Crompton made for the table of the marvelous rays. In minute detail he recalled every move made by Tom in starting and adjusting the apparatus to produce the incredible results he had witnessed. Not a moment was to be wasted now. Already he had hesitated too long, for soon would come the dawn and possible discovery of his crime. But the invention of his victim would save him from the long arm of the law, for, with youth restored, Old Crompton would cease to exist and a new life would open its doors to the starved soul of the hermit. Hermit, indeed! He would begin

life anew, an active man with youthful vigor and ambition. Under an assumed name he would travel abroad, would enjoy life, and would later become a successful man of affairs. He had enough money, he told himself. And the police would never find Old Crompton, the murderer of Tom Forsythe! He deposited his small traveling bag on the floor and fingered the controls of Tom's apparatus.

He threw the starting switch confidently and grinned in satisfaction as the answering whine of the motor-generator came to his ears. One by one he carefully made the adjustments in exactly the manner followed by the now silenced discoverer of the process.

Everything operated precisely as it had during the preceding experiments. Odd that he should have anticipated some such necessity! But something had told him to observe Tom's movements carefully, and now he rejoiced in the fact that his intuition had led him aright. Painfully he climbed to the table top and stretched his aching body in the warm light of the four huge tubes. His exertions during the struggle with Tom were beginning to tell on him. But the

soreness and stiffness of feeble muscles and stubborn joints would soon be but a memory. His pulses quickened at the thought and he breathed deep in a sudden feeling of unaccustomed well-being.

The dog growled continuously from his position at the head of his master, but did not move to interfere with the intruder. And Old Crompton, in the excitement of the momentous experience, paid him not the slightest attention.

His body tingled from head to foot with a not unpleasant sensation that conveyed the assurance of radical changes taking place under the influence of the vital rays. The tingling sensation increased in intensity until it seemed that every corpuscle in his veins danced to the tune of the vibration from those glowing tubes that bathed him in an ever-spreading radiance. Aches and pains vanished from his body, but he soon experienced a sharp stab of new pain in his lower jaw. With an experimental forefinger he rubbed the gum. He laughed aloud as the realization came to him that in those gums where there had been no teeth for more than twenty years there was now growing a

complete new set. And the rapidity of the process amazed him beyond measure. The aching area spread quickly and was becoming really uncomfortable. But then—and he consoled himself with the thought—nothing is brought into being without a certain amount of pain. Besides, he was confident that his discomfort would soon be over.

He examined his hand, and found that the joints of two fingers long crippled with rheumatism now moved freely and painlessly. The misty brilliance surrounding his body was paling and he saw that the flesh was taking on a faint green fluorescence instead. The rays had completed their work and soon the transformation would be fully effected. He turned on his side and slipped to the floor with the agility of a youngster. The dog snarled anew, but kept steadfastly to his position.

There was a small mirror over the wash stand at the far end of the room and Old Crompton made haste to obtain the first view of his reflected image. His step was firm and springy, his bearing confident, and he found that his long-stooped shoulders straightened

naturally and easily. He felt that he had taken on at least two inches in stature, which was indeed the case. When he reached the mirror he peered anxiously into its dingy surface and what he saw there so startled him that he stepped backward in amazement. This was not Larry Crompton, but an entirely new man. The straggly white hair had given way to soft, healthy waves of chestnut hue. Gone were the seams from the leathery countenance and the eyes looked out clearly and steadily from under brows as thick and dark as they had been in his youth. The reflected features were those of an entire stranger. They were not even reminiscent of the Larry Crompton of fifty years ago, but were the features of a far more vigorous and prepossessing individual than he had ever seemed, even in the best years of his life. The jaw was firm, the once sunken cheeks so well filled out that his high cheek bones were no longer in evidence. It was the face of a man of not more than thirty-eight years of age, reflecting exceptional intelligence and strength of character.

"What a disguise!" he exclaimed in delight. And his

voice, echoing in the stillness that followed the switching off of the apparatus, was deep-throated and mellow—the voice of a new man.

Now, serenely confident that discovery was impossible, he picked up his small but heavy bag and started for the door. Dawn was breaking and he wished to put as many miles between himself and Tom's laboratory as could be covered in the next few hours. But at the door he hesitated. Then, despite the furious yapping of Spot, he returned to the table of the rays and, with deliberate thoroughness smashed the costly tubes which had brought about his rehabilitation. With a pinch bar from a nearby tool rack, he wrecked the controls and generating mechanisms beyond recognition. Now he was absolutely secure! No meddling experts could possibly discover the secret of Tom's invention. All evidence would show that the young experimenter had met his death at the hands of Old Crompton, the despised hermit of West Laketon. But none would dream that the handsome man of means who was henceforth to be known as George Voight was that

same despised hermit.

He recovered his satchel and left the scene. With long, rapid strides he proceeded down the old dirt road toward the main highway where, instead of turning east into the village, he would turn west and walk to Kernsburg, the neighboring town. There, in not more than two hours time, his new life would really begin!

Had you, a visitor, departed from Laketon when Old Crompton did and returned twelve years later, you would have noticed very little difference in the appearance of the village. The old town hall and the little park were the same, the dingy brick building among the trees being just a little dingier and its wooden steps more worn and sagged. The main street showed evidence of recent repaving, and, in consequence of the resulting increase in through automobile traffic; there were two new gasoline filling stations in the heart of the town. Down the road about a half mile there was a new building, which, upon inquiring from one of the natives, would be proudly designated as the new high school building.

Otherwise there were no changes to be observed.

In his dilapidated chair in the untidy office he had occupied for nearly thirty years, sat Asa Culkin, popularly known as "Judge" Culkin. Justice of the peace, sheriff, attorney-at-law, and three times Mayor of Laketon, he was still a controlling factor in local politics and government. And many a knotty legal problem was settled in that gloomy little office. Many a dispute in the town council was dependent for arbitration upon the keen mind and understanding wit of the old judge.

The four o'clock train had just puffed its labored way from the station when a stranger entered his office, a stranger of uncommonly prosperous air. The keen blue eyes of the old attorney appraised him instantly and classified him as a successful man of business, not yet forty years of age, and with a weighty problem on his mind.

"What can I do for you, sir?" he asked, removing his feet from the battered desk top.

"You may be able to help me a great deal, Judge," was the unexpected reply. "I came to Laketon to give myself up."

"Give yourself up?" Culkin rose to his feet in surprise and unconsciously straightened his shoulders in the effort to seem less dwarfed before the tall stranger. "Why, what do you mean?" he inquired.

"I wish to give myself up for murder," answered the amazing visitor, slowly and with decision, "for a murder committed twelve years ago. I should like you to listen to my story first, though. It has been kept too long."

"But I still do not understand." There was puzzlement in the honest old face of the attorney. He shook his gray locks in uncertainty. "Why should you come here? Why come to me? What possible interest can I have in the matter?"

"Just this, Judge. You do not recognize me now, and you will probably consider my story incredible when you hear it. But, when I have given you all the

evidence, you will know who I am and will be compelled to believe. The murder was committed in Laketon. That is why I came to you."

"A murder in Laketon? Twelve years ago?" Again the aged attorney shook his head. "But—proceed."

"Yes. I killed Thomas Forsythe."

The stranger looked for an expression of horror in the features of his listener, but there was none. Instead the benign countenance took on a look of deepening amazement, but the smile wrinkles had somehow vanished and the old face was grave in its surprised interest.

"You seem astonished," continued the stranger.

"Undoubtedly you were convinced that the murderer was Larry Crompton—Old Crompton, the hermit. He disappeared the night of the crime and has never been heard from since. Am I correct?"

"Yes. He disappeared all right. But continue."

Not by a lift of his eyebrow did Culkin betray his disbelief, but the stranger sensed that his story was somehow not as startling as it should have been.

"You will think me crazy, I presume. But I am Old Crompton. It was my hand that felled the unfortunate young man in his laboratory out there in West Laketon twelve years ago to-night. It was his marvelous invention that transformed the old hermit into the apparently young man you see before you. But I swear that I am none other than Larry Crompton and that I killed young Forsythe. I am ready to pay the penalty. I can bear the flagellation of my own conscience no longer."

The visitor's voice had risen to the point of hysteria. But his listener remained calm and unmoved.

"Now just let me get this straight," he said quietly.

"Do I understand that you claim to be Old Crompton, rejuvenated in some mysterious manner, and that you killed Tom Forsythe on that night twelve years ago? Do I understand that you wish now to go to trial for that crime and to pay the penalty?"

"Yes! Yes! And the sooner the better. I can stand it no longer. I am the most miserable man in the world!"

"Hm-m—hm-m," muttered the judge, "this is strange." He spoke soothingly to his visitor. "Do not upset yourself, I beg of you. I will take care of this thing for you, never fear. Just take a seat, Mister—er—"

"You may call me Voight for the present," said the stranger, in a more composed tone of voice, "George Voight. That is the name I have been using since the mur—since that fatal night."

"Very well, Mr. Voight," replied the counsellor with an air of the greatest solicitude, "please have a seat now, while I make a telephone call."

And George Voight slipped into a stiff-backed chair with a sigh of relief. For he knew the judge from the old days and he was now certain that his case would be disposed of very quickly.

With the telephone receiver pressed to his ear, Culkin repeated a number. The stranger listened intently

during the ensuing silence. Then there came a muffled "hello" sounding in impatient response to the call.

"Hello, Alton," spoke the attorney, "this is Asa speaking. A stranger has just stepped into my office and he claims to be Old Crompton. Remember the hermit across the road from your son's old laboratory? Well, this man, who bears no resemblance whatever to the old man he claims to be and who seems to be less than half the age of Tom's old neighbor, says that he killed Tom on that night we remember so well."

There were some surprised remarks from the other end of the wire, but Voight was unable to catch them. He was in a cold perspiration at the thought of meeting his victim's father.

"Why, yes, Alton," continued Culkin, "I think there is something in this story, although I cannot believe it all. But I wish you would accompany us and visit the laboratory. Will you?"

"Lord, man, not that!" interrupted the judge's visitor. "I can hardly bear to visit the scene of my crime—and in the company of Alton Forsythe. Please, not that!"

"Now you just let me take care of this, young man," replied the judge, testily. Then, once more speaking into the mouthpiece of the telephone, "All right, Alton. We'll pick you up at your office in five minutes."

He replaced the receiver on its hook and turned again to his visitor. "Please be so kind as to do exactly as I request," he said. "I want to help you, but there is more to this thing than you know and I want you to follow unquestioningly where I lead and ask no questions at all for the present. Things may turn out differently than you expect."

"All right, Judge." The visitor resigned himself to whatever might transpire under the guidance of the man he had called upon to turn him over to the officers of the law.

Seated in the judge's ancient motor car, they stopped at the office of Alton Forsythe a few minutes later and

were joined by that red-faced and pompous old man. Few words were spoken during the short run to the well-remembered location of Tom's laboratory, and the man who was known as George Voight caught at his own throat with nervous fingers when they passed the tumbledown remains of the hut in which Old Crompton had spent so many years. With a screeching of well-worn brakes the car stopped before the laboratory, which was now almost hidden behind a mass of shrubs and flowers.

"Easy now, young man," cautioned the judge, noting the look of fear which had clouded his new client's features. The three men advanced to the door through which Old Crompton had fled on that night of horror, twelve years before. The elder Forsythe spoke not a word as he turned the knob and stepped within. Voight shrank from entering, but soon mastered his feelings and followed the other two. The sight that met his eyes caused him to cry aloud in awe.

At the dissecting table, which seemed to be exactly as he had seen it last but with replicas of the tubes he had destroyed once more in place, stood Tom

Forsythe! Considerably older and with hair prematurely gray, he was still the young man Old Crompton thought he had killed. Tom Forsythe was not dead after all! And all of his years of misery had gone for nothing. He advanced slowly to the side of the wondering young man, Alton Forsythe and Asa Culkin watching silently from just inside the door.

"Tom—Tom," spoke the stranger, "you are alive? You were not dead when I left you on that terrible night when I smashed your precious tubes? Oh—it is too good to be true! I can scarcely believe my eyes!"

He stretched forth trembling fingers to touch the body of the young man to assure himself that it was not all a dream.

"Why," said Tom Forsythe, in astonishment. "I do not know you, sir. Never saw you in my life. What do you mean by your talk of smashing my tubes, of leaving me for dead?"

"Mean?" The stranger's voice rose now; he was growing excited. "Why, Tom, I am Old Crompton.

Remember the struggle, here in this very room? You refused to rejuvenate an unhappy old man with your marvelous apparatus, a temporarily insane old man—Crompton. I was that old man and I fought with you. You fell, striking your head. There was blood. You were unconscious. Yes, for many hours I was sure you were dead and that I had murdered you. But I had watched your manipulations of the apparatus and I subjected myself to the action of the rays. My youth was miraculously restored. I became as you see me now. Detection was impossible, for I looked no more like Old Crompton than you do. I smashed your machinery to avoid suspicion. Then I escaped. And, for twelve years, I have thought myself a murderer. I have suffered the tortures of the damned!"

Tom Forsythe advanced on this remarkable visitor with clenched fists. Staring him in the eyes with cold appraisal, his wrath was all too apparent. The dog Spot, young as ever, entered the room and, upon observing the stranger, set up an ominous growling and snarling. At least the dog recognized him!

"What are you trying to do, catechise me? Are you

another of these alienists my father has been bringing around?" The young inventor was furious. "If you are," he continued, "you can get out of here—now! I'll have no more of this meddling with my affairs. I'm as sane as any of you and I refuse to submit to this continual persecution."

The elder Forsythe grunted, and Culkin laid a restraining hand on his arm. "Just a minute now, Tom," he said soothingly. "This stranger is no alienist. He has a story to tell. Please permit him to finish."

Somewhat mollified, Tom Forsythe shrugged his assent.

"Tom," continued the stranger, more calmly now, "what I have said is the truth. I shall prove it to you. I'll tell you things no mortals on earth could know but we two. Remember the day I captured the big rooster for you—the monster you had created? Remember the night you awakened me and brought me here in the moonlight? Remember the rabbit whose leg you amputated and re-grew? The poor guinea pig you had suffocated and whose life you restored? Spot here?

Don't you remember rejuvenating him? I was here. And you refused to use your process on me, old man that I was. Then is when I went mad and attacked you. Do you believe me, Tom?"

Then a strange thing happened. While Tom Forsythe gazed in growing belief, the stranger's shoulders sagged and he trembled as with the ague. The two older men who had kept in the background gasped their astonishment as his hair faded to a sickly gray, then became as white as the driven snow. Old Crompton was reverting to his previous state! Within five minutes, instead of the handsome young stranger, there stood before them a bent, withered old man—Old Crompton beyond a doubt. The effects of Tom's process were spent.

"Well I'm damned!" ejaculated Alton Forsythe. "You have been right all along, Asa. And I am mighty glad I did not commit Tom as I intended. He has told us the truth all these years and we were not wise enough to see it."

"We!" exclaimed the judge. "You, Alton Forsythe! I

have always upheld him. You have done your son a grave injustice and you owe him your apologies if ever a father owed his son anything."

"You are right, Asa." And, his aristocratic pride forgotten, Alton Forsythe rushed to the side of his son and embraced him.

The judge turned to Old Crompton pityingly. "Rather a bad ending for you, Crompton," he said. "Still, it is better by far than being branded as a murderer."

"Better? Better?" croaked Old Crompton. "It is wonderful, Judge. I have never been so happy in my life!"

The face of the old man beamed, though scalding tears coursed down the withered and seamed cheeks. The two Forsythes looked up from their demonstrations of peacemaking to listen to the amazing words of the old hermit.

"Yes, happy for the first time in my life," he continued. "I am one hundred years of age, gentlemen, and I now

look it and feel it. That is as it should be. And my experience has taught me a final lasting lesson. None of you know it, but, when I was but a very young man I was bitterly disappointed in love. Ha! ha! Never think it to look at me now, would you? But I was, and it ruined my entire life. I had a little money—inherited—and I traveled about in the world for a few years, then settled in that old hut across the road where I buried myself for sixty years, becoming crabbed and sour and despicable. Young Tom here was the first bright spot and, though I admired him, I hated him for his opportunities, hated him for that which he had that I had not. With the promise of his invention I thought I saw happiness, a new life for myself. I got what I wanted, though not in the way I had expected. And I want to tell you gentlemen that there is nothing in it. With developments of modern science you may be able to restore a man's youthful vigor of body, but you can't cure his mind with electricity. Though I had a youthful body, my brain was the brain of an old man—memories were there which could not be suppressed. Even had I not had the fancied death of young Tom on my conscience I should still have been

miserable. I worked. God, how I worked—to forget! But I could not forget. I was successful in business and made a lot of money. I am more independent—probably wealthier than you, Alton Forsythe, but that did not bring happiness. I longed to be myself once more, to have the aches and pains which had been taken from me. It is natural to age and to die. Immortality would make of us a people of restless misery. We would quarrel and bicker and long for death, which would not come to relieve us. Now it is over for me and I am glad—glad—glad!"

He paused for breath, looking beseechingly at Tom Forsythe. "Tom," he said, "I suppose you have nothing for me in your heart but hatred. And I don't blame you. But I wish—I wish you would try and forgive me. Can you?"

The years had brought increased understanding and tolerance to young Tom. He stared at Old Crompton and the long-nursed anger over the destruction of his equipment melted into a strange mixture of pity and admiration for the courageous old fellow.

"Why, I guess I can, Crompton," he replied. "There was many a day when I struggled hopelessly to reconstruct my apparatus, cursing you with every bit of energy in my make-up. I could cheerfully have throttled you, had you been within reach. For twelve years I have labored incessantly to reproduce the results we obtained on the night of which you speak. People called me insane—even my father wished to have me committed to an asylum. And, until now, I have been unsuccessful. Only to-day has it seemed for the first time that the experiments will again succeed. But my ideas have changed with regard to the uses of the process. I was a cocksure young pup in the old days, with foolish dreams of fame and influence. But I have seen the error of my ways. Your experience, too, convinces me that immortality may not be as desirable as I thought. But there are great possibilities in the way of relieving the sufferings of mankind and in making this a better world in which to live. With your advice and help I believe I can do great things. I now forgive you freely and I ask you to remain here with me to assist in the work that is to come. What do you say to the idea?"

At the reverent thankfulness in the pale eyes of the broken old man who had so recently been a perfect specimen of vigorous youth, Alton Forsythe blew his nose noisily. The little judge smiled benevolently and shook his head as if to say, "I told you so." Tom and Old Crompton gripped hands—mightily.

#09 Spawn of the Stars, by Charles Willard

Diffin:

The earth lay powerless beneath those loathsome, yellowish monsters that, sheathed in cometlike globes, sprang from the skies to annihilate man and reduce his cities to ashes.

When Cyrus R. Thurston bought himself a single-motored Stoughton job he was looking for new thrills. Flying around the east coast had lost its zest: he wanted to join that jaunty group who spoke so easily of hopping off for Los Angeles.

And what Cyrus Thurston wanted he usually obtained. But if that young millionaire-sportsman had been told that on his first flight this blocky, bulletlike ship was

to pitch him headlong into the exact center of the wildest, strangest war this earth had ever seen—well, it is still probable that the Stoughton company would not have lost the sale.

They were roaring through the starlit, calm night, three thousand feet above a sage sprinkled desert, when the trip ended. Slim Riley had the stick when the first blast of hot oil ripped slashingly across the pilot's window. "There goes your old trip!" he yelled. "Why don't they try putting engines in these ships?"

He jammed over the throttle and, with motor idling, swept down toward the endless miles of moonlit waste. Wind? They had been boring into it. Through the opened window he spotted a likely stretch of ground. Setting down the ship on a nice piece of Arizona desert was a mere detail for Slim.

"Let off a flare," he ordered, "when I give the word."

The white glare of it faded the stars as he sideslipped, then straightened out on his hand-picked field. The plane rolled down a clear space and stopped. The

bright glare persisted while he stared curiously from the quiet cabin. Cutting the motor he opened both windows, then grabbed Thurston by the shoulder.

"'Tis a curious thing, that," he said unsteadily. His hand pointed straight ahead. The flare died, but the bright stars of the desert country still shone on a glistening, shining bulb.

It was some two hundred feet away. The lower part was lost in shadow, but its upper surfaces shone rounded and silvery like a giant bubble. It towered in the air, scores of feet above the chaparral beside it. There was a round spot of black on its side, which looked absurdly like a door....

"I saw something moving," said Thurston slowly. "On the ground I saw.... Oh, good Lord, Slim, it isn't real!"

Slim Riley made no reply. His eyes were riveted to an undulating, ghastly something that oozed and crawled in the pale light not far from the bulb. His hand was reaching, reaching.... It found what he sought; he leaned toward the window. In his hand was the Very

pistol for discharging the flares. He aimed forward and up.

The second flare hung close before it settled on the sandy floor. Its blinding whiteness made the more loathsome the sickening yellow of the flabby flowing thing that writhed frantically in the glare. It was formless, shapeless, a heaving mound of nauseous matter. Yet even in its agonized writhing distortions they sensed the beating pulsations that marked it a living thing.

There were unending ripples crossing and recrossing through the convolutions. To Thurston there was suddenly a sickening likeness: the thing was a brain from a gigantic skull—it was naked—was suffering....

The thing poured itself across the sand. Before the staring gaze of the speechless men an excrescence appeared—a thick bulb on the mass—that protruded itself into a tentacle. At the end there grew instantly a hooked hand. It reached for the black opening in the great shell, found it, and the whole loathsome

shapelessness poured itself up and through the hole.

Only at the last was it still. In the dark opening the last slippery mass held quiet for endless seconds. It formed, as they watched, to a head—frightful—menacing. Eyes appeared in the head; eyes flat and round and black save for a cross slit in each; eyes that stared horribly and unchangingly into theirs. Below them a gaping mouth opened and closed.... The head melted—was gone....

And with its going came a rushing roar of sound.

From under the metallic mass shrieked a vaporous cloud. It drove at them, a swirling blast of snow and sand. Some buried memory of gas attacks woke Riley from his stupor. He slammed shut the windows an instant before the cloud struck, but not before they had seen, in the moonlight, a gleaming, gigantic, elongated bulb rise swiftly—screamingly—into the upper air.

The blast tore at their plane. And the cold in their tight compartment was like the cold of outer space.

The men stared, speechless, panting. Their breath froze in that frigid room into steam clouds.

"It—it...." Thurston gasped—and slumped helpless upon the floor.

It was an hour before they dared open the door of their cabin. An hour of biting, numbing cold. Zero—on a warm summer night on the desert! Snow in the hurricane that had struck them!

"'Twas the blast from the thing," guessed the pilot; "though never did I see an engine with an exhaust like that." He was pounding himself with his arms to force up the chilled circulation.

"But the beast—the—the *thing*!" exclaimed Thurston. "It's monstrous; indecent! It thought—no question of that—but no body! Horrible! Just a raw, naked, thinking protoplasm!"

It was here that he flung open the door. They sniffed cautiously of the air. It was warm again—clean—save for a hint of some nauseous odor. They walked

forward; Riley carried a flash.

The odor grew to a stench as they came where the great mass had lain. On the ground was a fleshy mound. There were bones showing, and horns on a skull. Riley held the light close to show the body of a steer. A body of raw bleeding meat. Half of it had been absorbed....

"The damned thing," said Riley, and paused vainly for adequate words. "The damned thing was eating.... Like a jelly-fish, it was!"

"Exactly," Thurston agreed. He pointed about. There were other heaps scattered among the low sage.

"Smothered," guessed Thurston, "with that frozen exhaust. Then the filthy thing landed and came out to eat."

"Hold the light for me," the pilot commanded. "I'm goin' to fix that busted oil line. And I'm goin' to do it right now. Maybe the creature's still hungry."

They sat in their room. About them was the luxury of a modern hotel. Cyrus Thurston stared vacantly at the breakfast he was forgetting to eat. He wiped his hands mechanically on a snowy napkin. He looked from the window. There were palm trees in the park, and autos in a ceaseless stream. And people! Sane, sober people, living in a sane world. Newsboys were shouting; the life of the city was flowing.

"Riley!" Thurston turned to the man across the table. His voice was curiously toneless, and his face haggard. "Riley, I haven't slept for three nights. Neither have you. We've got to get this thing straight. We didn't both become absolute maniacs at the same instant, but—it was *not* there, it was *never* there—not *that*...." He was lost in unpleasant recollections. "There are other records of hallucinations."

"Hallucinations—hell!" said Slim Riley. He was looking at a Los Angeles newspaper. He passed one hand wearily across his eyes, but his face was happier than it had been in days.

"We didn't imagine it, we aren't crazy—it's real!"

Would you read that now!" He passed the paper across to Thurston. The headlines were startling.

"Pilot Killed by Mysterious Airship. Silvery Bubble Hangs Over New York. Downs Army Plane in Burst of Flame. Vanishes at Terrific Speed."

"It's our little friend," said Thurston. And on his face, too, the lines were vanishing; to find this horror a reality was positive relief. "Here's the same cloud of vapor—drifted slowly across the city, the accounts says, blowing this stuff like steam from underneath. Airplanes investigated—an army plane drove into the vapor—terrific explosion—plane down in flames—others wrecked. The machine ascended with meteor speed, trailing blue flame. Come on, boy, where's that old bus? Thought I never wanted to fly a plane again. Now I don't want to do anything but."

"Where to?" Slim inquired.

"Headquarters," Thurston told him. "Washington—let's go!"

From Los Angeles to Washington is not far, as the plane flies. There was a stop or two for gasoline, but it was only a day later that they were seated in the War Office. Thurston's card had gained immediate admittance. "Got the low-down," he had written on the back of his card, "on the mystery airship."

"What you have told me is incredible," the Secretary was saying, "or would be if General Lozier here had not reported personally on the occurrence at New York. But the monster, the thing you have described.... Cy, if I didn't know you as I do I would have you locked up."

"It's true," said Thurston, simply. "It's damnable, but it's true. Now what does it mean?"

"Heaven knows," was the response. "That's where it came from—out of the heavens."

"Not what we saw," Slim Riley broke in. "That thing came straight out of Hell." And in his voice was no suggestion of levity.

"You left Los Angeles early yesterday; have you seen the papers?"

Thurston shook his head.

"They are back," said the Secretary. "Reported over London—Paris—the West Coast. Even China has seen them. Shanghai cabled an hour ago."

"Them? How many are there?"

"Nobody knows. There were five seen at one time. There are more—unless the same ones go around the world in a matter of minutes."

Thurston remembered that whirlwind of vapor and a vanishing speck in the Arizona sky. "They could," he asserted. "They're faster than anything on earth. Though what drives them ... that gas—steam—whatever it is...."

"Hydrogen," stated General Lozier. "I saw the New York show when poor Davis got his. He flew into the exhaust; it went off like a million bombs."

Characteristic hydrogen flame trailed the damn thing up out of sight—a tail of blue fire."

"And cold," stated Thurston.

"Hot as a Bunsen burner," the General contradicted.

"Davis' plane almost melted."

"Before it ignited," said the other. He told of the cold in their plane.

"Ha!" The General spoke explosively. "That's expansion. That's a tip on their motive power. Expansion of gas. That accounts for the cold and the vapor. Suddenly expanded it would be intensely cold. The moisture of the air would condense, freeze. But how could they carry it? Or"—he frowned for a moment, brows drawn over deep-set gray eyes—"or generate it? But that's crazy—that's impossible!"

"So is the whole matter," the Secretary reminded him. "With the information Mr. Thurston and Mr. Riley have given us, the whole affair is beyond any gage our past experience might supply. We start from the

impossible, and we go—where? What is to be done?"

"With your permission, sir, a number of things shall be done. It would be interesting to see what a squadron of planes might accomplish, diving on them from above. Or anti-aircraft fire."

"No," said the Secretary of War, "not yet. They have looked us over, but they have not attacked. For the present we do not know what they are. All of us have our suspicions—thoughts of interplanetary travel—thoughts too wild for serious utterance—but we know nothing.

"Say nothing to the papers of what you have told me," he directed Thurston. "Lord knows their surmises are wild enough now. And for you, General, in the event of any hostile move, you will resist."

"Your order was anticipated, sir." The General permitted himself a slight smile. "The air force is ready."

"Of course," the Secretary of War nodded. "Meet me

here to-night—nine o'clock." He included Thurston and Riley in the command. "We need to think ... to think ... and perhaps their mission is friendly."

"Friendly!" The two flyers exchanged glances as they went to the door. And each knew what the other was seeing—a viscous ocherous mass that formed into a head where eyes devilish in their hate stared coldly into theirs....

"Think, we need to think," repeated Thurston later. "A creature that is just one big hideous brain, that can think an arm into existence—think a head where it wishes! What does a thing like that think of? What beastly thoughts could that—that *thing* conceive?"

"If I got the sights of a Lewis gun on it," said Riley vindictively, "I'd make it think."

"And my guess is that is all you would accomplish," Thurston told him. "I am forming a few theories about our visitors. One is that it would be quite impossible to find a vital spot in that big homogeneous mass."

The pilot dispensed with theories: his was a more literal mind. "Where on earth did they come from, do you suppose, Mr. Thurston?"

They were walking to their hotel. Thurston raised his eyes to the summer heavens. Faint stars were beginning to twinkle; there was one that glowed steadily.

"Nowhere on earth," Thurston stated softly, "nowhere on earth."

"Maybe so," said the pilot, "maybe so. We've thought about it and talked about it ... and they've gone ahead and done it." He called to a newsboy; they took the latest editions to their room.

The papers were ablaze with speculation. There were dispatches from all corners of the earth, interviews with scientists and near scientists. The machines were a Soviet invention—they were beyond anything human—they were harmless—they would wipe out civilization—poison gas—blasts of fire like that which had enveloped the army flyer....

And through it all Thurston read an ill-concealed fear, a reflection of panic that was gripping the nation—the whole world. These great machines were sinister. Wherever they appeared came the sense of being watched, of a menace being calmly withheld. And at thought of the obscene monsters inside those spheres, Thurston's lips were compressed and his eyes hardened. He threw the papers aside.

"They are here," he said, "and that's all that we know. I hope the Secretary of War gets some good men together. And I hope someone is inspired with an answer."

"An answer is it?" said Riley. "I'm thinkin' that the answer will come, but not from these swivel-chair fighters. 'Tis the boys in the cockpits with one hand on the stick and one on the guns that will have the answer."

But Thurston shook his head. "Their speed," he said, "and the gas! Remember that cold. How much of it can they lay over a city?"

The question was unanswered, unless the quick ringing of the phone was a reply.

"War Department," said a voice. "Hold the wire." The voice of the Secretary of War came on immediately.

"Thurston?" he asked. "Come over at once on the jump, old man. Hell's popping."

The windows of the War Department Building were all alight as they approached. Cars were coming and going; men in uniform, as the Secretary had said, "on the jump." Soldiers with bayonets stopped them, then passed Thurston and his companion on. Bells were ringing from all sides. But in the Secretary's office was perfect quiet.

General Lozier was there, Thurston saw, and an imposing array of gold-braided men with a sprinkling of those in civilian clothes. One he recognized: MacGregor from the Bureau of Standards. The Secretary handed Thurston some papers.

"Radio," he explained. "They are over the Pacific

coast. Hit near Vancouver; Associated Press says city destroyed. They are working down the coast. Same story—blast of hydrogen from their funnel shaped base. Colder than Greenland below them; snow fell in Seattle. No real attack since Vancouver and little damage done—" A message was laid before him.

"Portland," he said. "Five mystery ships over city. Dart repeatedly toward earth, deliver blast of gas and then retreat. Doing no damage. Apparently inviting attack. All commercial planes ordered grounded. Awaiting instructions.

"Gentlemen," said the Secretary, "I believe I speak for all present when I say that, in the absence of first hand information, we are utterly unable to arrive at any definite conclusion or make a definite plan. There is a menace in this, undeniably. Mr. Thurston and Mr. Riley have been good enough to report to me. They have seen one machine at close range. It was occupied by a monster so incredible that the report would receive no attention from me did I not know Mr. Thurston personally.

"Where have they come from? What does it mean—what is their mission? Only God knows.

"Gentlemen, I feel that I must see them. I want General Lozier to accompany me, also Doctor MacGregor, to advise me from the scientific angle. I am going to the Pacific Coast. They may not wait—that is true—but they appear to be going slowly south. I will leave to-night for San Diego. I hope to intercept them. We have strong air-forces there; the Navy Department is cooperating."

He waited for no comment. "General," he ordered, "will you kindly arrange for a plane? Take an escort or not as you think best.

"Mr. Thurston and Mr. Riley will also accompany us. We want all the authoritative data we can get. This on my return will be placed before you, gentlemen, for your consideration." He rose from his chair. "I hope they wait for us," he said.

Time was when a commander called loudly for a horse, but in this day a Secretary of War is not kept

waiting for transportation. Sirening motorcycles preceded them from the city. Within an hour, motors roaring wide open, propellers ripping into the summer night, lights slipping eastward three thousand feet below, the Secretary of War for the United States was on his way. And on either side from their plane stretched the arms of a V. Like a flight of gigantic wild geese, fast fighting planes of the Army air service bored steadily into the night, guarantors of safe convoy.

"The Air Service is ready," General Lozier had said. And Thurston and his pilot knew that from East coast to West, swift scout planes, whose idling engines could roar into action at a moment's notice, stood waiting; battle planes hidden in hangars would roll forth at the word—the Navy was cooperating—and at San Diego there were strong naval units, Army units, and Marine Corps.

"They don't know what we can do, what we have up our sleeve: they are feeling us out," said the Secretary. They had stopped more than once for gas and for wireless reports. He held a sheaf of

typewritten briefs.

"Going slowly south. They have taken their time. Hours over San Francisco and the bay district. Repeating same tactics; fall with terrific speed to cushion against their blast of gas. Trying to draw us out, provoke an attack, make us show our strength. Well, we shall beat them to San Diego at this rate. We'll be there in a few hours."

The afternoon sun was dropping ahead of them when they sighted the water. "Eckener Pass," the pilot told them, "where the Graf Zeppelin came through. Wonder what these birds would think of a Zepp!"

"There's the ocean," he added after a time. San Diego glistened against the bare hills. "There's North Island—the Army field." He stared intently ahead, then shouted: "And there they are! Look there!"

Over the city a cluster of meteors was falling. Dark underneath, their tops shone like pure silver in the sun's slanting glare. They fell toward the city, then buried themselves in a dense cloud of steam,

rebounding at once to the upper air, vapor trailing behind them.

The cloud billowed slowly. It struck the hills of the city, then lifted and vanished.

"Land at once," requested the Secretary. A flash of silver countermanded the order.

It hung there before them, a great gleaming globe, keeping always its distance ahead. It was elongated at the base, Thurston observed. From that base shot the familiar blast that turned steamy a hundred feet below as it chilled the warm air. There were round orifices, like ports, ranged around the top, where an occasional jet of vapor showed this to be a method of control. Other spots shone dark and glassy. Were they windows? He hardly realized their peril, so interested was he in the strange machine ahead.

Then: "Dodge that vapor," ordered General Lozier. The plane wavered in signal to the others and swung sharply to the left. Each man knew the flaming death that was theirs if the fire of their exhaust touched that

explosive mixture of hydrogen and air. The great bubble turned with them and paralleled their course.

"He's watching us," said Riley, "giving us the once over, the slimy devil. Ain't there a gun on this ship?"

The General addressed his superior. Even above the roar of the motors his voice seemed quiet, assured.

"We must not land now," he said. "We can't land at North Island. It would focus their attention upon our defenses. That thing—whatever it is—is looking for a vulnerable spot. We must.... Hold on—there he goes!"

The big bulb shot upward. It slanted above them, and hovered there.

"I think he is about to attack," said the General quietly. And, to the commander of their squadron: "It's in your hands now, Captain. It's your fight."

The Captain nodded and squinted above. "He's got to throw heavier stuff than that," he remarked. A small object was falling from the cloud. It passed close to their ship.

"Half-pint size," said Cyrus Thurston, and laughed in derision. There was something ludicrous in the futility of the attack. He stuck his head from a window into the gale they created. He sheltered his eyes to try to follow the missile in its fall.

They were over the city. The criss-cross of streets made a grill-work of lines; tall buildings were dwarfed from this three thousand foot altitude. The sun slanted across a projecting promontory to make golden ripples on a blue sea and the city sparkled back in the clear air. Tiny white faces were massed in the streets, huddled in clusters where the futile black missile had vanished.

And then—then the city was gone....

A white cloud-bank billowed and mushroomed. Slowly, it seemed to the watcher—so slowly.

It was done in the fraction of a second. Yet in that brief time his eyes registered the chaotic sweep in advance of the cloud. There came a crashing of buildings in some monster whirlwind, a white cloud

engulfing it all.... It was rising—was on them.

"God," thought Thurston, "why can't I move!" The plane lifted and lurched. A thunder of sound crashed against them, an intolerable force. They were crushed to the floor as the plane was hurled over and upward.

Out of the mad whirling tangle of flying bodies, Thurston glimpsed one clear picture. The face of the pilot hung battered and blood-covered before him, and over the limp body the hand of Slim Riley clutched at the switch.

"Bully boy," he said dazedly, "he's cutting the motors...." The thought ended in blackness.

There was no sound of engines or beating propellers when he came to his senses. Something lay heavy upon him. He pushed it to one side. It was the body of General Lozier.

He drew himself to his knees to look slowly about, rubbed stupidly at his eyes to quiet the whirl, then stared at the blood on his hand. It was so quiet—the

motors—what was it that happened? Slim had reached for the switch....

The whirling subsided. Before him he saw Slim Riley at the controls. He got to his feet and went unsteadily forward. It was a battered face that was lifted to his.

"She was spinning," the puffed lips were muttering slowly. "I brought her out ... there's the field...." His voice was thick; he formed the words slowly, painfully. "Got to land ... can you take it? I'm—I'm—" He slumped limply in his seat.

Thurston's arms were uninjured. He dragged the pilot to the floor and got back of the wheel. The field was below them. There were planes taxiing out; he heard the roar of their motors. He tried the controls. The plane answered stiffly, but he managed to level off as the brown field approached.

Thurston never remembered that landing. He was trying to drag Riley from the battered plane when the first man got to him.

"Secretary of War?" he gasped. "In there.... Take Riley; I can walk."

"We'll get them," an officer assured him. "Knew you were coming. They sure gave you hell! But look at the city!"

Arms carried him stumbling from the field. Above the low hangars he saw smoke clouds over the bay. These and red rolling flames marked what had been an American city. Far in the heavens moved five glinting specks.

His head reeled with the thunder of engines. There were planes standing in lines and more erupting from hangars, where khaki-clad men, faces tense under leather helmets, rushed swiftly about.

"General Lozier is dead," said a voice. Thurston turned to the man. They were bringing the others. "The rest are smashed up some," the officer told him, "but I think they'll pull through."

The Secretary of War for the United States lay beside

him. Men with red on their sleeves were slitting his coat. Through one good eye he squinted at Thurston. He even managed a smile.

"Well, I wanted to see them up close," he said. "They say you saved us, old man."

Thurston waved that aside. "Thank Riley—" he began, but the words ended in the roar of an exhaust. A plane darted swiftly away to shoot vertically a hundred feet in the air. Another followed and another. In a cloud of brown dust they streamed endlessly out, zooming up like angry hornets, eager to get into the fight.

"Fast little devils!" the ambulance man observed. "Here come the big boys."

A leviathan went deafeningly past. And again others came on in quick succession. Farther up the field, silvery gray planes with rudders flaunting their red, white and blue rose circling to the heights.

"That's the Navy," was the explanation. The surgeon

straightened the Secretary's arm. "See them come off the big airplane carriers!"

If his remarks were part of his professional training in removing a patient's thoughts from his pain, they were effective. The Secretary stared out to sea, where two great flat-decked craft were shooting planes with the regularity of a rapid fire gun. They stood out sharply against a bank of gray fog. Cyrus Thurston forgot his bruised body, forgot his own peril—even the inferno that raged back across the bay: he was lost in the sheer thrill of the spectacle.

Above them the sky was alive with winged shapes.

IMAGEDescription

And from all the disorder there was order appearing. Squadron after squadron swept to battle formation. Like flights of wild ducks the true sharp-pointed Vs soared off into the sky. Far above and beyond, rows of dots marked the race of swift scouts for the upper levels. And high in the clear air shone the glittering menace trailing their five plumes of gas.

A deeper detonation was merging into the uproar. It came from the ships, Thurston knew, where anti-aircraft guns poured a rain of shells into the sky. About the invaders they bloomed into clusters of smoke balls. The globes shot a thousand feet into the air. Again the shells found them, and again they retreated.

"Look!" said Thurston. "They got one!"

He groaned as a long curving arc of speed showed that the big bulb was under control. Over the ships it paused, to balance and swing, then shot to the zenith as one of the great boats exploded in a cloud of vapor.

The following blast swept the airdrome. Planes yet on the ground went like dry autumn leaves. The hangars were flattened.

Thurston cowered in awe. They were sheltered, he saw, by a slope of the ground. No ridicule now for the bombs!

A second blast marked when the gas-cloud ignited. The billowing flames were blue. They writhed in tortured convulsions through the air. Endless explosions merged into one rumbling roar.

MacGregor had roused from his stupor; he raised to a sitting position.

"Hydrogen," he stated positively, and pointed where great volumes of flame were sent whirling aloft. "It burns as it mixes with air." The scientist was studying intently the mammoth reaction. "But the volume," he marveled, "the volume! From that small container! Impossible!"

"Impossible," the Secretary agreed, "but...." He

pointed with his one good arm toward the Pacific. Two great ships of steel, blackened and battered in that fiery breath, tossed helplessly upon the pitching, heaving sea. They furnished to the scientist's exclamation the only adequate reply.

Each man stared aghast into the pallid faces of his companions. "I think we have underestimated the opposition," said the Secretary of War quietly. "Look—the fog is coming in, but it's too late to save them."

The big ships were vanishing in the oncoming fog. Whirls of vapor were eddying toward them in the flame-blaster air. Above them the watchers saw dimly the five gleaming bulbs. There were airplanes attacking: the tapping of machine-gun fire came to them faintly.

Fast planes circled and swooped toward the enemy. An armada of big planes drove in from beyond. Formations were blocking space above.... Every branch of the service was there, Thurston exulted, the army, Marine Corps, the Navy. He gripped hard at the dry ground in a paralysis of taut nerves. The battle

was on, and in the balance hung the fate of the world.

The fog drove in fast. Through straining eyes he tried in vain to glimpse the drama spread above. The world grew dark and gray. He buried his face in his hands.

And again came the thunder. The men on the ground forced their gaze to the clouds, though they knew some fresh horror awaited.

The fog-clouds reflected the blue terror above. They were riven and torn. And through them black objects were falling. Some blazed as they fell. They slipped into unthought maneuvers—they darted to earth trailing yellow and black of gasoline fires. The air was filled with the dread rain of death that was spewed from the gray clouds. Gone was the roaring of motors. The air-force of the San Diego area swept in silence to the earth, whose impact alone could give kindly concealment to their flame-stricken burden.

Thurston's last control snapped. He flung himself flat to bury his face in the sheltering earth.

Only the driving necessity of work to be done saved the sanity of the survivors. The commercial broadcasting stations were demolished, a part of the fuel for the terrible furnace across the bay. But the Naval radio station was beyond on an outlying hill. The Secretary of War was in charge. An hour's work and this was again in commission to flash to the world the story of disaster. It told the world also of what lay ahead. The writing was plain. No prophet was needed to forecast the doom and destruction that awaited the earth.

Civilization was helpless. What of armies and cannon, of navies, of aircraft, when from some unreachable height these monsters within their bulbous machines could drop coldly—methodically—their diminutive bombs. And when each bomb meant shattering destruction; each explosion blasting all within a radius of miles; each followed by the blue blast of fire that melted the twisted framework of buildings and powdered the stones to make of a proud city a desolation of wreckage, black and silent beneath the cold stars. There was no crumb of comfort for the

world in the terror the radio told.

Slim Riley was lying on an improvised cot when Thurston and the representative of the Bureau of Standards joined him. Four walls of a room still gave shelter in a half-wrecked building. There were candles burning: the dark was unbearable.

"Sit down," said MacGregor quietly; "we must think...."

"Think!" Thurston's voice had an hysterical note. "I can't think! I mustn't think! I'll go raving crazy...."

"Yes, think," said the scientist. "Had it occurred to you that that is our only weapon left?"

"We must think, we must analyze. Have these devils a vulnerable spot? Is there any known means of attack? We do not know. We must learn. Here in this room we have all the direct information the world possesses of this menace. I have seen their machines in operation. You have seen more—you have looked at the monsters themselves. At one of them, anyway."

The man's voice was quiet, methodical. Mr. MacGregor was attacking a problem. Problems called for concentration; not hysterics. He could have poured the contents from a beaker without spilling a drop. His poise was needed: they were soon to make a laboratory experiment.

The door burst open to admit a wild-eyed figure that snatched up their candles and dashed them to the floor.

"Lights out!" he screamed at them. "There's one of 'em coming back." He was gone from the room.

The men sprang for the door, then turned to where Riley was clumsily crawling from his couch. An arm under each of his, and the three men stumbled from the room.

They looked about them in the night. The fog-banks were high, drifting in from the ocean. Beneath them the air was clear; from somewhere above a hidden moon forced a pale light through the clouds. And over the ocean, close to the water, drifted a familiar shape.

Familiar in its huge sleek roundness, in its funnel-shaped base where a soft roar made vaporous clouds upon the water. Familiar, too, in the wild dread it inspired.

The watchers were spellbound. To Thurston there came a fury of impotent frenzy. It was so near! His hands trembled to tear at that door, to rip at that foul mass he knew was within.... The great bulb drifted past. It was nearing the shore. But its action! Its motion!

Gone was the swift certainty of control. The thing settled and sank, to rise weakly with a fresh blast of gas from its exhaust. It settled again, and passed waveringly on in the night.

Thurston was throbbingly alive with hope that was certainty. "It's been hit," he exulted; "it's been hit. Quick! After it, follow it!" He dashed for a car. There were some that had been salvaged from the less ruined buildings. He swung it quickly around where the others were waiting.

"Get a gun," he commanded. "Hey, you,"—to an officer who appeared—"your pistol, man, quick! We're going after it!" He caught the tossed gun and hurried the others into the car.

"Wait," MacGregor commanded. "Would you hunt elephants with a pop-gun? Or these things?"

"Yes," the other told him, "or my bare hands! Are you coming, or aren't you?"

The physicist was unmoved. "The creature you saw—you said that it writhed in a bright light—you said it seemed almost in agony. There's an idea there! Yes, I'm going with you, but keep your shirt on, and think."

He turned again to the officer. "We need lights," he explained, "bright lights. What is there? Magnesium? Lights of any kind?"

"Wait." The man rushed off into the dark.

He was back in a moment to thrust a pistol into the car. "Flares," he explained. "Here's a flashlight, if you

need it." The car tore at the ground as Thurston opened it wide. He drove recklessly toward the highway that followed the shore.

The high fog had thinned to a mist. A full moon was breaking through to touch with silver the white breakers hissing on the sand. It spread its full glory on dunes and sea: one more of the countless soft nights where peace and calm beauty told of an ageless existence that made naught of the red havoc of men or of monsters. It shone on the ceaseless surf that had beaten these shores before there were men, that would thunder there still when men were no more. But to the tense crouching men in the car it shone only ahead on a distant, glittering speck. A wavering reflection marked the uncertain flight of the stricken enemy.

Thurston drove like a maniac; the road carried them straight toward their quarry. What could he do when he overtook it? He neither knew nor cared. There was only the blind fury forcing him on within reach of the thing. He cursed as the lights of the car showed a bend in the road. It was leaving the shore.

He slackened their speed to drive cautiously into the sand. It dragged at the car, but he fought through to the beach, where he hoped for firm footing. The tide was out. They tore madly along the smooth sand, breakers clutching at the flying wheels.

The strange aircraft was nearer; it was plainly over the shore, they saw. Thurston groaned as it shot high in the air in an effort to clear the cliffs ahead. But the heights were no longer a refuge. Again it settled. It struck on the cliff to rebound in a last futile leap. The great pear shape tilted, then shot end over end to crash hard on the firm sand. The lights of the car struck the wreck, and they saw the shell roll over once. A ragged break was opening—the spherical top fell slowly to one side. It was still rocking as they brought the car to a stop. Filling the lower shell, they saw dimly, was a mucouslike mass that seethed and struggled in the brilliance of their lights.

MacGregor was persisting in his theory. "Keep the lights on it!" he shouted. "It can't stand the light."

While they watched, the hideous, bubbling beast

oozed over the side of the broken shell to shelter itself in the shadow beneath. And again Thurston sensed the pulse and throb of life in the monstrous mass.

He saw again in his rage the streaming rain of black airplanes; saw, too, the bodies, blackened and charred as they saw them when first they tried rescue from the crashed ships; the smoke clouds and flames from the blasted city, where people—his people, men and women and little children—had met terrible death. He sprang from the car. Yet he faltered with a revulsion that was almost a nausea. His gun was gripped in his hand as he ran toward the monster.

"Come back!" shouted MacGregor. "Come back! Have you gone mad?" He was jerking at the door of the car.

Beyond the white funnel of their lights a yellow thing was moving. It twisted and flowed with incredible speed a hundred feet back to the base of the cliff. It drew itself together in a quivering heap.

An out-thrusting rock threw a sheltering shadow; the

moon was low in the west. In the blackness a phosphorescence was apparent. It rippled and rose in the dark with the pulsing beat of the jellylike mass. And through it were showing two discs. Gray at first, they formed to black, staring eyes.

Thurston had followed. His gun was raised as he neared it. Then out of the mass shot a serpentine arm. It whipped about him, soft, sticky, viscid—utterly loathsome. He screamed once when it clung to his face, then tore savagely and in silence at the encircling folds.

The gun! He ripped a blinding mass from his face and emptied the automatic in a stream of shots straight toward the eyes. And he knew as he fired that the effort was useless; to have shot at the milky surf would have been as vain.

The thing was pulling him irresistibly; he sank to his knees; it dragged him over the sand. He clutched at a rock. A vision was before him: the carcass of a steer, half absorbed and still bleeding on the sand of an Arizona desert....

To be drawn to the smothering embrace of that glutinous mass ... for that monstrous appetite.... He tore afresh at the unyielding folds, then knew MacGregor was beside him.

In the man's hand was a flashlight. The scientist risked his life on a guess. He thrust the powerful light into the clinging serpent. It was like the touch of hot iron to human flesh. The arm struggled and flailed in a paroxysm of pain.

Thurston was free. He lay gasping on the sand. But MacGregor!... He looked up to see him vanish in the clinging ooze. Another thick tentacle had been projected from the main mass to sweep like a whip about the man. It hissed as it whirled about him in the still air.

The flashlight was gone; Thurston's hand touched it in the sand. He sprang to his feet and pressed the switch. No light responded; the flashlight was out—broken.

A thick arm slashed and wrapped about him.... It beat

him to the ground. The sand was moving beneath him; he was being dragged swiftly, helplessly, toward what waited in the shadow. He was smothering.... A blinding glare filled his eyes....

The flares were still burning when he dared look about. MacGregor was pulling frantically at his arm. "Quick—quick!" he was shouting. Thurston scrambled to his feet.

One glimpse he caught of a heaving yellow mass in the white light; it twisted in horrible convulsions. They ran stumblingly—drunkenly—toward the car.

Riley was half out of the machine. He had tried to drag himself to their assistance. "I couldn't make it," he said: "then I thought of the flares."

"Thank Heaven," said MacGregor with emphasis, "it was your legs that were paralyzed, Riley, not your brain."

Thurston found his voice. "Let me have that Very pistol. If light hurts that damn thing, I am going to

put a blaze of magnesium into the middle of it if I die for it."

"They're all gone," said Riley.

"Then let's get out of here. I've had enough. We can come back later on."

He got back of the wheel and slammed the door of the sedan. The moonlight was gone. The darkness was velvet just tinged with the gray that precedes the dawn. Back in the deeper blackness at the cliff-base a phosphorescent something wavered and glowed. The light rippled and flowed in all directions over the mass. Thurston felt, vaguely, its mystery—the bulk was a vast, naked brain; its quiverings were like visible thought waves....

The phosphorescence grew brighter. The thing was approaching. Thurston let in his clutch, but the scientist checked him.

"Wait," he implored, "wait! I wouldn't miss this for the world." He waved toward the east, where far distant

ranges were etched in palest rose.

"We know less than nothing of these creatures, in what part of the universe they are spawned, how they live, where they live—Saturn!—Mars!—the Moon! But—we shall soon know how one dies!"

The thing was coming from the cliff. In the dim grayness it seemed less yellow, less fluid. A membrane enclosed it. It was close to the car. Was it hunger that drove it, or cold rage for these puny opponents? The hollow eyes were glaring; a thick arm formed quickly to dart out toward the car. A cloud, high above, caught the color of approaching day....

Before their eyes the vile mass pulsed visibly; it quivered and beat. Then, sensing its danger, it darted like some headless serpent for its machine.

It massed itself about the shattered top to heave convulsively. The top was lifted, carried toward the rest of the great metal egg. The sun's first rays made golden arrows through the distant peaks.

The struggling mass released its burden to stretch its vile length toward the dark caves under the cliffs. The last sheltering fog-veil parted. The thing was halfway to the high bank when the first bright shaft of direct sunlight shot through.

Incredible in the concealment of night, the vast protoplasmic pod was doubly so in the glare of day. But it was there before them, not a hundred feet distant. And it boiled in vast tortured convulsions. The clean sunshine struck it, and the mass heaved itself into the air in a nauseous eruption, then fell limply to the earth.

The yellow membrane turned paler. Once more the staring black eyes formed to turn hopelessly toward the sheltering globe. Then the bulk flattened out on the sand. It was a jellylike mound, through which trembled endless quivering palpitations.

The sun struck hot, and before the eyes of the watching, speechless men was a sickening, horrible sight—a festering mass of corruption.

The sickening yellow was liquid. It seethed and bubbled with liberated gases; it decomposed to purplish fluid streams. A breath of wind blew in their direction. The stench from the hideous pool was overpowering, unbearable. Their heads swam in the evil breath.... Thurston ripped the gears into reverse, nor stopped until they were far away on the clean sand.

The tide was coming in when they returned. Gone was the vile putrescence. The waves were lapping at the base of the gleaming machine.

"We'll have to work fast," said MacGregor. "I must know, I must learn." He drew himself up and into the shattered shell.

It was of metal, some forty feet across, its framework a maze of latticed struts. The central part was clear. Here in a wide, shallow pan the monster had rested. Below this was tubing, intricate coils, massive, heavy and strong. MacGregor lowered himself upon it, Thurston was beside him. They went down into the dim bowels of the deadly instrument.

"Hydrogen," the physicist was stating. "Hydrogen—there's our starting point. A generator, obviously, forming the gas—from what? They couldn't compress it! They couldn't carry it or make it, not the volume that they evolved. But they did it, they did it!"

Close to the coils a dim light was glowing. It was a pin-point of radiance in the half-darkness about them. The two men bent closer.

"See," directed MacGregor, "it strikes on this mirror—bright metal and parabolic. It disperses the light, doesn't concentrate it! Ah! Here is another, and another. This one is bent—broken. They are adjustable. Hm! Micrometer accuracy for reducing the light. The last one could reflect through this slot. It's light that does it, Thurston, it's light that does it!"

"Does what?" Thurston had followed the other's analysis of the diffusion process. "The light that would finally reach that slot would be hardly perceptible."

"It's the agent," said MacGregor, "the activator—the catalyst! What does it strike upon? I must know—I

must!"

The waves were splashing outside the shell. Thurston turned in a feverish search of the unexplored depths. There was a surprising simplicity, an absence of complicated mechanism. The generator, with its tremendous braces to carry its thrust to the framework itself, filled most of the space. Some of the ribs were thicker, he noticed. Solid metal, as if they might carry great weights. Resting upon them were ranged numbers of objects. They were like eggs, slender, and inches in length. On some were propellers. They worked through the shells on long slender rods. Each was threaded finely—an adjustable arm engaged the thread. Thurston called excitedly to the other.

"Here they are," he said. "Look! Here are the shells. Here's what blew us up!"

He pointed to the slim shafts with their little propellerlike fans. "Adjustable, see? Unwind in their fall ... set 'em for any length of travel ... fires the charge in the air. That's how they wiped out our air

fleet."

There were others without the propellers; they had fins to hold them nose downward. On each nose was a small rounded cap.

"Detonators of some sort," said MacGregor. "We've got to have one. We must get it out quick; the tide's coming in." He laid his hands upon one of the slim, egg-shaped things. He lifted, then strained mightily. But the object did not rise; it only rolled sluggishly.

The scientist stared at it amazed. "Specific gravity," he exclaimed, "beyond anything known! There's nothing on earth ... there is no such substance ... no form of matter...." His eyes were incredulous.

"Lots to learn," Thurston answered grimly. "We've yet to learn how to fight off the other four."

The other nodded. "Here's the secret," he said. "These shells liberate the same gas that drives the machine. Solve one and we solve both—then we learn how to combat it. But how to remove it—that is the problem.

You and I can never lift this out of here."

His glance darted about. There was a small door in the metal beam. The groove in which the shells were placed led to it; it was a port for launching the projectiles. He moved it, opened it. A dash of spray struck him in the face. He glanced inquiringly at his companion.

"Dare we do it?" he asked. "Slide one of them out?"

Each man looked long into the eyes of the other. Was this, then, the end of their terrible night? One shell to be dropped—then a bursting volcano to blast them to eternity....

"The boys in the planes risked it," said Thurston quietly. "They got theirs." He stopped for a broken fragment of steel. "Try one with a fan on; it hasn't a detonator."

The men pried at the slim thing. It slid slowly toward the open port. One heave and it balanced on the edge, then vanished abruptly. The spray was cold on their

faces. They breathed heavily with the realization that they still lived.

There were days of horror that followed, horror tempered by a numbing paralysis of all emotions. There were bodies by thousands to be heaped in the pit where San Diego had stood, to be buried beneath countless tons of debris and dirt. Trains brought an army of helpers; airplanes came with doctors and nurses and the beginning of a mountain of supplies. The need was there; it must be met. Yet the whole world was waiting while it helped, waiting for the next blow to fall.

Telegraph service was improvised, and radio receivers rushed in. The news of the world was theirs once more. And it told of a terrified, waiting world. There would be no temporizing now on the part of the invaders. They had seen the airplanes swarming from the ground—they would know an airdrome next time from the air. Thurston had noted the windows in the great shell, windows of dull-colored glass which would protect the darkness of the interior, essential to life for the horrible occupant, but through which it

could see. It could watch all directions at once.

The great shell had vanished from the shore.

Pounding waves and the shifting sands of high tide had obliterated all trace. More than once had Thurston uttered devout thanks for the chance shell from an anti-aircraft gun that had entered the funnel beneath the machine, had bent and twisted the arrangement of mirrors that he and MacGregor had seen, and, exploding, had cracked and broken the domed roof of the bulb. They had learned little, but MacGregor was up north within reach of Los Angeles laboratories. And he had with him the slim cylinder of death. He was studying, thinking.

Telephone service had been established for official business. The whole nation-wide system, for that matter, was under military control. The Secretary of War had flown back to Washington. The whole world was on a war basis. War! And none knew where they should defend themselves, nor how.

An orderly rushed Thurston to the telephone. "You are wanted at once; Los Angeles calling."

The voice of MacGregor was cool and unhurried as Thurston listened. "Grab a plane, old man," he was saying, "and come up here on the jump."

The phrase brought a grim smile to Thurston's tired lips. "Hell's popping!" the Secretary of War had added on that evening those long ages before. Did MacGregor have something? Was a different kind of hell preparing to pop? The thoughts flashed through the listener's mind.

"I need a good deputy," MacGregor said. "You may be the whole works—may have to carry on—but I'll tell you it all later. Meet me at the Biltmore."

"In less than two hours," Thurston assured him.

A plane was at his disposal. Riley's legs were functioning again, after a fashion. They kept the appointment with minutes to spare.

"Come on," said MacGregor, "I'll talk to you in the car." The automobile whirled them out of the city to race off upon a winding highway that climbed into far

hills. There was twenty miles of this; MacGregor had time for his talk.

"They've struck," he told the two men. "They were over Germany yesterday. The news was kept quiet: I got the last report a half-hour ago. They pretty well wiped out Berlin. No air-force there. France and England sent a swarm of planes, from the reports. Poor devils! No need to tell you what they got. We've seen it first hand. They headed west over the Atlantic, the four machines. Gave England a burst or two from high up, paused over New York, then went on. But they're here somewhere, we think. Now listen:

"How long was it from the time when you saw the first monster until we heard from them again?"

Thurston forced his mind back to those days that seemed so far in the past. He tried to remember.

"Four days," broke in Riley. "It was the fourth day after we found the devil feeding."

"Feeding!" interrupted the scientist. "That's the point

I am making. Four days. Remember that!

"And we knew they were down in the Argentine five days ago—that's another item kept from an hysterical public. They slaughtered some thousands of cattle; there were scores of them found where the devils—I'll borrow Riley's word—where the devils had fed. Nothing left but hide and bones.

"And—mark this—that was four days before they appeared over Berlin.

"Why? Don't ask me. Do they have to lie quiet for that period miles up there in space? God knows. Perhaps! These things seem outside the knowledge of a deity. But enough of that! Remember: four days! Let us assume that there is this four days waiting period. It will help us to time them. I'll come back to that later.

"Here is what I have been doing. We know that light is a means of attack. I believe that the detonators we saw on those bombs merely opened a seal in the shell and forced in a flash of some sort. I believe that radiant energy is what fires the blast.

"What is it that explodes? Nobody knows. We have opened the shell, working in the absolute blackness of a room a hundred feet underground. We found in it a powder—two powders, to be exact.

"They are mixed. One is finely divided, the other rather granular. Their specific gravity is enormous, beyond anything known to physical science unless it would be the hypothetical neutron masses we think are in certain stars. But this is not matter as we know matter; it is something new.

"Our theory is this: the hydrogen atom has been split, resolved into components, not of electrons and the proton centers, but held at some halfway point of decomposition. Matter composed only of neutrons would be heavy beyond belief. This fits the theory in that respect. But the point is this: When these solids are formed—they are dense—they represent in a cubic centimeter possibly a cubic mile of hydrogen gas under normal pressure. That's a guess, but it will give you the idea.

"Not compressed, you understand, but all the

elements present in other than elemental form for the reconstruction of the atom ... for a million billions of atoms.

"Then the light strikes it. These dense solids become instantly a gas—miles of it held in that small space.

"There you have it: the gas, the explosion, the entire absence of heat—which is to say, its terrific cold—when it expands."

Slim Riley was looking bewildered but game. "Sure, I saw it snow," he affirmed, "so I guess the rest must be O.K. But what are we going to do about it? You say light kills 'em, and fires their bombs. But how can we let light into those big steel shells, or the little ones either?"

"Not through those thick walls," said MacGregor. "Not light. One of our anti-aircraft shells made a direct hit. That might not happen again in a million shots. But there are other forms of radiant energy that do penetrate steel...."

The car had stopped beside a grove of eucalyptus. A barren, sun-baked hillside stretched beyond. MacGregor motioned them to alight.

Riley was afire with optimism. "And do you believe it?" he asked eagerly. "Do you believe that we've got 'em licked?"

Thurston, too, looked into MacGregor's face: Riley was not the only one who needed encouragement. But the gray eyes were suddenly tired and hopeless.

"You ask what I believe," said the scientist slowly. "I believe we are witnessing the end of the world, our world of humans, their struggles, their grave hopes and happiness and aspirations...."

He was not looking at them. His gaze was far off in space.

"Men will struggle and fight with their puny weapons, but these monsters will win, and they will have their way with us. Then more of them will come. The world, I believe, is doomed...."

He straightened his shoulders. "But we can die fighting," he added, and pointed over the hill.

"Over there," he said, "in the valley beyond, is a charge of their explosive and a little apparatus of mine. I intend to fire the charge from a distance of three hundred yards. I expect to be safe, perfectly safe. But accidents happen.

"In Washington a plane is being prepared. I have given instructions through hours of phoning. They are working night and day. It will contain a huge generator for producing my ray. Nothing new! Just the product of our knowledge of radiant energy up to date. But the man who flies that plane will die—horribly. No time to experiment with protection. The rays will destroy him, though he may live a month.

"I am asking you," he told Cyrus Thurston, "to handle that plane. You may be of service to the world—you may find you are utterly powerless. You surely will die. But you know the machines and the monsters; your knowledge may be of value in an attack." He waited. The silence lasted for only a moment.

"Why, sure," said Cyrus Thurston.

He looked at the eucalyptus grove with earnest appraisal. The sun made lovely shadows among their stripped trunks: the world was a beautiful place. A lingering death, MacGregor had intimated—and horrible.... "Why, sure," he repeated steadily.

Slim Riley shoved him firmly aside to stand facing MacGregor.

"Sure, hell!" he said. "I'm your man, Mr. MacGregor.

"What do you know about flying?" he asked Cyrus Thurston. "You're good—for a beginner. But men like you two have got brains, and I'm thinkin' the world will be needin' them. Now me, all I'm good for is holdin' a shtick"—his brogue had returned to his speech, and was evidence of his earnestness.

"And, besides"—the smile faded from his lips, and his voice was suddenly soft—"them boys we saw take their last flip was just pilots to you, just a bunch of good fighters. Well, they're buddies of mine. I fought

beside some of them in France.... I belong!"

He grinned happily at Thurston. "Besides," he said, "what do you know about dog-fights?"

MacGregor gripped him by the hand. "You win," he said. "Report to Washington. The Secretary of War has all the dope."

He turned to Thurston. "Now for you! Get this! The enemy machines almost attacked New York. One of them came low, then went back, and the four flashed out of sight toward the west. It is my belief that New York is next, but the devils are hungry. The beast that attacked us was ravenous, remember. They need food and lots of it. You will hear of their feeding, and you can count on four days. Keep Riley informed—that's your job.

"Now I'm going over the hill. If this experiment works, there's a chance we can repeat it on a larger scale. No certainty, but a chance! I'll be back. Full instructions at the hotel in case...." He vanished into the scrub growth.

"Not exactly encouraging," Thurston pondered, "but he's a good man, Mac, a good egg! Not as big a brain as the one we saw, but perhaps it's a better one—cleaner—and it's working!"

They were sheltered under the brow of the hill, but the blast from the valley beyond rocked them like an earthquake. They rushed to the top of the knoll. MacGregor was standing in the valley; he waved them a greeting and shouted something unintelligible.

The gas had mushroomed into a cloud of steamy vapor. From above came snowflakes to whirl in the churning mass, then fall to the ground. A wind came howling about them to beat upon the cloud. It swirled slowly back and down the valley. The figure of MacGregor vanished in its smothering embrace.

"Exit, MacGregor!" said Cyrus Thurston softly. He held tight to the struggling figure of Slim Riley.

"He couldn't live a minute in that atmosphere of hydrogen," he explained. "They can—the devils!—but not a good egg like Mac. It's our job now—yours and

mine."

Slowly the gas retreated, lifted to permit their passage down the slope.

MacGregor was a good prophet. Thurston admitted that when, four days later, he stood on the roof of the Equitable Building in lower New York.

The monsters had fed as predicted. Out in Wyoming a desolate area marked the place of their meal, where a great herd of cattle lay smothered and frozen. There were ranch houses, too, in the circle of destruction, their occupants frozen stiff as the carcasses that dotted the plains. The country had stood tense for the following blow. Only Thurston had lived in certainty of a few days reprieve. And now had come the fourth day.

In Washington was Riley. Thurston had been in touch with him frequently.

"Sure, it's a crazy machine," the pilot had told him, "and 'tis not much I think of it at all. Neither bullets

nor guns, just this big glass contraption and speed. She's fast, man, she's fast ... but it's little hope I have." And Thurston, remembering the scientist's words, was heartless and sick with dreadful certainty.

There were aircraft ready near New York; it was generally felt that here was the next objective. The enemy had looked it over carefully. And Washington, too, was guarded. The nation's capital must receive what little help the aircraft could afford.

There were other cities waiting for destruction. If not this time—later! The horror hung over them all.

The fourth day! And Thurston was suddenly certain of the fate of New York. He hurried to a telephone. Of the Secretary of War he implored assistance.

"Send your planes," he begged. "Here's where we will get it next. Send Riley. Let's make a last stand—win or lose."

"I'll give you a squadron," was the concession. "What difference whether they die there or here...?" The

voice was that of a weary man, weary and sleepless and hopeless.

"Good-by Cy, old man!" The click of the receiver sounded in Thurston's ear. He returned to the roof for his vigil.

To wait, to stride nervously back and forth in impotent expectancy. He could leave, go out into open country, but what were a few days or months—or a year—with this horror upon them? It was the end. MacGregor was right. "Good old Mac!"

There were airplanes roaring overhead. It meant.... Thurston abruptly was cold; a chill gripped at his heart.

The paroxysm passed. He was doubled with laughter—or was it he who was laughing? He was suddenly buoyantly carefree. Who was he that it mattered? Cyrus Thurston—an ant! And their ant-hill was about to be snuffed out....

He walked over to a waiting group and clapped one

man on the shoulder. "Well, how does it feel to be an ant?" he inquired and laughed loudly at the jest. "You and your millions of dollars, your acres of factories, your steamships, railroads!"

The man looked at him strangely and edged cautiously away. His eyes, like those of the others, had a dazed, stricken look. A woman was sobbing softly as she clung to her husband. From the streets far below came a quavering shrillness of sound.

The planes gathered in climbing circles. Far on the horizon were four tiny glinting specks....

Thurston stared until his eyes were stinging. He was walking in a waking sleep as he made his way to the stone coping beyond which was the street far below. He was dead—dead!—right this minute. What were a few minutes more or less? He could climb over the coping; none of the huddled, fear-gripped group would stop him. He could step out into space and fool them, the devils. They could never kill him....

What was it MacGregor had said? Good egg,

MacGregor! "But we can die fighting...." Yes, that was it—die fighting. But he couldn't fight; he could only wait. Well, what were the others doing, down there in the streets—in their homes? He could wait with them, die with them....

He straightened slowly and drew one long breath. He looked steadily and unafraid at the advancing specks. They were larger now. He could see their round forms. The planes were less noisy: they were far up in the heights—climbing—climbing.

The bulbs came slantingly down. They were separating. Thurston wondered vaguely.

What had they done in Berlin? Yes, he remembered. Placed themselves at the four corners of a great square and wiped out the whole city in one explosion. Four bombs dropped at the same instant while they shot up to safety in the thin air. How did they communicate? Thought transference, most likely. Telepathy between those great brains, one to another. A plane was falling. It curved and swooped in a trail of flame, then fell straight toward the earth. They

were fighting....

Thurston stared above. There were clusters of planes diving down from on high. Machine-guns stuttered faintly. "Machine-guns—toys! Brave, that was it! 'We can die fighting.'" His thoughts were far off; it was like listening to another's mind.

The air was filled with swelling clouds. He saw them before the blast struck where he stood. The great building shuddered at the impact. There were things falling from the clouds, wrecks of planes, blazing and shattered. Still came others; he saw them faintly through the clouds. They came in from the West; they had gone far to gain altitude. They drove down from the heights—the enemy had drifted—they were over the bay.

More clouds, and another blast thundering at the city. There were specks, Thurston saw, falling into the water.

Again the invaders came down from the heights where they had escaped their own shattering attack.

There was the faint roar of motors behind, from the south. The squadron from Washington passed overhead.

They surely had seen the fate that awaited. And they drove on to the attack, to strike at an enemy that shot instantly into the sky leaving crashing destruction about the torn dead.

"Now!" said Cyrus Thurston aloud.

The big bulbs were back. They floated easily in the air, a plume of vapor billowing beneath. They were ranging to the four corners of a great square.

One plane only was left, coming in from the south, a lone straggler, late for the fray. One plane! Thurston's shoulders sagged heavily. All they had left! It went swiftly overhead.... It was fast—fast. Thurston suddenly knew. It was Riley in that plane.

"Go back, you fool!"—he was screaming at the top of his voice—"Back—back—you poor, damned, decent Irishman!"

Tears were streaming down his face. "His buddies," Riley had said. And this was Riley, driving swiftly in, alone, to avenge them....

He saw dimly as the swift plane sped over the first bulb, on and over the second. The soft roar of gas from the machines drowned the sound of his engine. The plane passed them in silence to bank sharply toward the third corner of the forming square.

He was looking them over, Thurston thought. And the damn beasts disregarded so contemptible an opponent. He could still leave. "For God's sake, Riley, beat it—escape!"

Thurston's mind was solely on the fate of the lone voyager—until the impossible was borne in upon him.

The square was disrupted. Three great bulbs were now drifting. The wind was carrying them out toward the bay. They were coming down in a long, smooth descent. The plane shot like a winged rocket at the fourth great, shining ball. To the watcher, aghast with sudden hope, it seemed barely to crawl.

"The ray! The ray...." Thurston saw as if straining eyes had pierced through the distance to see the invisible. He saw from below the swift plane, the streaming, intangible ray. That was why Riley had flown closely past and above them—the ray poured from below. His throat was choking him, strangling....

The last enemy took alarm. Had it seen the slow sinking of its companions, failed to hear them in reply to his mental call? The shining pear shape shot violently upward; the attacking plane rolled to a vertical bank as it missed the threatening clouds of exhaust. "What do you know about dog-fights?" And Riley had grinned ... Riley belonged!

The bulb swelled before Thurston's eyes in its swift descent. It canted to one side to head off the struggling plane that could never escape, did not try to escape. The steady wings held true upon their straight course. From above came the silver meteor; it seemed striking at the very plane itself. It was almost upon it before it belched forth the cushioning blast of gas.

Through the forming clouds a plane bored in swiftly. It rolled slowly, was flying upside down. It was under the enemy! Its ray.... Thurston was thrown a score of feet away to crash helpless into the stone coping by the thunderous crash of the explosion.

There were fragments falling from a dense cloud—fragments of curved and silvery metal ... the wing of a plane danced and fluttered in the air....

"He fired its bombs," whispered Thurston in a shaking voice. "He killed the other devils where they lay—he destroyed this with its own explosive. He flew upside down to shoot up with the ray, to set off its shells...."

His mind was fumbling with the miracle of it. "Clever pilot, Riley, in a dog-fight...." And then he realized.

Cyrus Thurston, millionaire sportsman, sank slowly, numbly to the roof of the Equitable Building that still stood. And New York was still there ... and the whole world....

He sobbed weakly, brokenly. Through his dazed brain

flashed a sudden, mind-saving thought. He laughed foolishly through his sobs.

"And you said he'd die horribly, Mac, a horrible death." His head dropped upon his arms, unconscious—and safe—with the rest of humanity.

#10 The Corpse on the Grating, by Hugh Barnett Cave:

In the gloomy depths of the old warehouse dale saw a thing that drew a scream of horror to his dry lips. It was a corpse—the mold of decay on its long-dead features—and yet it was alive!

- - -

It was ten o'clock on the morning of December 5 when M. S. and I left the study of Professor Daimler. You are perhaps acquainted with M. S. His name appears constantly in the pages of the Illustrated News, in conjunction with some very technical article on psycho-analysis or with some extensive study of the human brain and its functions. He is a psycho-fanatic, more or less, and has spent an entire lifetime

of some seventy-odd years in pulling apart human skulls for the purpose of investigation. Lovely pursuit!

For some twenty years I have mocked him, in a friendly, half-hearted fashion. I am a medical man, and my own profession is one that does not sympathize with radicals.

As for Professor Daimler, the third member of our triangle—perhaps, if I take a moment to outline the events of that evening, the Professor's part in what follows will be less obscure. We had called on him, M. S. and I, at his urgent request. His rooms were in a narrow, unlighted street just off the square, and Daimler himself opened the door to us. A tall, loosely built chap he was, standing in the doorway like a motionless ape, arms half extended.

"I've summoned you, gentlemen," he said quietly, "because you two, of all London, are the only persons who know the nature of my recent experiments. I should like to acquaint you with the results!"

He led the way to his study, then kicked the door shut

with his foot, seizing my arm as he did so. Quietly he dragged me to the table that stood against the farther wall. In the same even, unemotional tone of a man completely sure of himself, he commanded me to inspect it.

For a moment, in the semi-gloom of the room, I saw nothing. At length, however, the contents of the table revealed themselves, and I distinguished a motley collection of test tubes, each filled with some fluid. The tubes were attached to each other by some ingenious arrangement of thistles, and at the end of the table, where a chance blow could not brush it aside, lay a tiny phial of the resulting serum. From the appearance of the table, Daimler had evidently drawn a certain amount of gas from each of the smaller tubes, distilling them through acid into the minute phial at the end. Yet even now, as I stared down at the fantastic paraphernalia before me, I could sense no conclusive reason for its existence.

I turned to the Professor with a quiet stare of bewilderment. He smiled.

"The experiment is over," he said. "As to its conclusion, you, Dale, as a medical man, will be sceptical. And you"—turning to M. S.—"as a scientist you will be amazed. I, being neither physician nor scientist, am merely filled with wonder!"

He stepped to a long, square table-like structure in the center of the room. Standing over it, he glanced quizzically at M. S., then at me.

"For a period of two weeks," he went on, "I have kept, on the table here, the body of a man who has been dead more than a month. I have tried, gentlemen, with acid combinations of my own origination, to bring that body back to life. And ... I have—failed!

"But," he added quickly, noting the smile that crept across my face, "that failure was in itself worth more than the average scientist's greatest achievement! You know, Dale, that heat, if a man is not truly dead, will sometimes resurrect him. In a case of epilepsy, for instance, victims have been pronounced dead only to return to life—sometimes in the grave.

"I say 'if a man be not truly dead.' But what if that man *is* truly dead? Does the cure alter itself in any manner? The motor of your car dies—do you bury it? You do not; you locate the faulty part, correct it, and infuse new life. And so, gentlemen, after remedying the ruptured heart of this dead man, by operation, I proceeded to bring him back to life.

"I used heat. Terrific heat will sometimes originate a spark of new life in something long dead. Gentlemen, on the fourth day of my tests, following a continued application of electric and acid heat, the patient—"

Daimler leaned over the table and took up a cigarette. Lighting it, he dropped the match and resumed his monologue.

"The patient turned suddenly over and drew his arm weakly across his eyes. I rushed to his side. When I reached him, the body was once again stiff and lifeless. And—it has remained so."

The Professor stared at us quietly, waiting for comment. I answered him, as carelessly as I could,

with a shrug of my shoulders.

"Professor, have you ever played with the dead body of a frog?" I said softly.

He shook his head silently.

"You would find it interesting sport," I told him. "Take a common dry cell battery with enough voltage to render a sharp shock. Then apply your wires to various parts of the frog's anatomy. If you are lucky, and strike the right set of muscles, you will have the pleasure of seeing a dead frog leap suddenly forward. Understand, he will not regain life. You have merely released his dead muscles by shock, and sent him bolting."

The Professor did not reply. I could feel his eyes on me, and had I turned, I should probably have found M. S. glaring at me in honest hate. These men were students of mesmerism, of spiritualism, and my commonplace contradiction was not over welcome.

"You are cynical, Dale," said M. S. coldly, "because

you do not understand!"

"Understand? I am a doctor—not a ghost!"

But M. S. had turned eagerly to the Professor.

"Where is this body—this experiment?" he demanded.

Daimler shook his head. Evidently he had acknowledged failure and did not intend to drag his dead man before our eyes, unless he could bring that man forth alive, upright, and ready to join our conversation!

"I've put it away," he said distantly. "There is nothing more to be done, now that our reverend doctor has insisted in making a matter of fact thing out of our experiment. You understand, I had not intended to go in for wholesale resurrection, even if I had met with success. It was my belief that a dead body, like a dead piece of mechanism, can be brought to life again, provided we are intelligent enough to discover the secret. And by God, it is *still* my belief!"

That was the situation, then, when M. S. and I paced slowly back along the narrow street that contained the Professor's dwelling-place. My companion was strangely silent. More than once I felt his eyes upon me in an uncomfortable stare, yet he said nothing. Nothing, that is, until I had opened the conversation with some casual remark about the lunacy of the man we had just left.

"You are wrong in mocking him, Dale," M. S. replied bitterly. "Daimler is a man of science. He is no child, experimenting with a toy; he is a grown man who has the courage to believe in his powers. One of these days...."

He had intended to say that some day I should respect the Professor's efforts. One of these days! The interval of time was far shorter than anything so indefinite. The first event, with its succeeding series of horrors, came within the next three minutes.

We had reached a more deserted section of the square, a black, uninhabited street extending like a shadowed band of darkness between gaunt, high

walls. I had noticed for some time that the stone structure beside us seemed to be unbroken by door or window—that it appeared to be a single gigantic building, black and forbidding. I mentioned the fact to M. S.

"The warehouse," he said simply. "A lonely, God-forsaken place. We shall probably see the flicker of the watchman's light in one of the upper chinks."

At his words, I glanced up. True enough, the higher part of the grim structure was punctured by narrow, barred openings. Safety vaults, probably. But the light, unless its tiny gleam was somewhere in the inner recesses of the warehouse, was dead. The great building was like an immense burial vault, a tomb—silent and lifeless.

We had reached the most forbidding section of the narrow street, where a single arch-lamp overhead cast a halo of ghastly yellow light over the pavement. At the very rim of the circle of illumination, where the shadows were deeper and more silent, I could make out the black mouldings of a heavy iron grating. The

bars of metal were designed, I believe, to seal the side entrance of the great warehouse from night marauders. It was bolted in place and secured with a set of immense chains, immovable.

This much I saw as my intent gaze swept the wall before me. This huge tomb of silence held for me a peculiar fascination, and as I paced along beside my gloomy companion, I stared directly ahead of me into the darkness of the street. I wish to God my eyes had been closed or blinded!

He was hanging on the grating. Hanging there, with white, twisted hands clutching the rigid bars of iron, straining to force them apart. His whole distorted body was forced against the barrier, like the form of a madman struggling to escape from his cage. His face—the image of it still haunts me whenever I see iron bars in the darkness of a passage—was the face of a man who has died from utter, stark horror. It was frozen in a silent shriek of agony, staring out at me with fiendish maliciousness. Lips twisted apart. White teeth gleaming in the light. Bloody eyes, with a horrible glare of colorless pigment. And—*dead*.

I believe M. S. saw him at the very instant I recoiled. I felt a sudden grip on my arm; and then, as an exclamation came harshly from my companion's lips, I was pulled forward roughly. I found myself staring straight into the dead eyes of that fearful thing before me, found myself standing rigid, motionless, before the corpse that hung within reach of my arm.

And then, through that overwhelming sense of the horrible, came the quiet voice of my comrade—the voice of a man who looks upon death as nothing more than an opportunity for research.

"The fellow has been frightened to death, Dale. Frightened most horribly. Note the expression of his mouth, the evident struggle to force these bars apart and escape. Something has driven fear to his soul, killed him."

I remember the words vaguely. When M. S. had finished speaking, I did not reply. Not until he had stepped forward and bent over the distorted face of the thing before me, did I attempt to speak. When I did, my thoughts were a jargon.

"What, in God's name," I cried, "could have brought such horror to a strong man? What—"

"Loneliness, perhaps," suggested M. S. with a smile. "The fellow is evidently the watchman. He is alone, in a huge, deserted pit of darkness, for hours at a time. His light is merely a ghostly ray of illumination, hardly enough to do more than increase the darkness. I have heard of such cases before."

He shrugged his shoulders. Even as he spoke, I sensed the evasion in his words. When I replied, he hardly heard my answer, for he had suddenly stepped forward, where he could look directly into those fear twisted eyes.

"Dale," he said at length, turning slowly to face me, "you ask for an explanation of this horror? There *is* an explanation. It is written with an almost fearful clearness on this fellow's mind. Yet if I tell you, you will return to your old skepticism—your damnable habit of disbelief!"

I looked at him quietly. I had heard M. S. claim, at

other times, that he could read the thoughts of a dead man by the mental image that lay on that man's brain. I had laughed at him. Evidently, in the present moment, he recalled those laughs. Nevertheless, he faced me seriously.

"I can see two things, Dale," he said deliberately. "One of them is a dark, narrow room—a room piled with indistinct boxes and crates, and with an open door bearing the black number 4167. And in that open doorway, coming forward with slow steps—alive, with arms extended and a frightful face of passion—is a decayed human form. A corpse, Dale. A man who has been dead for many days, and is now—*alive!*"

M. S. turned slowly and pointed with upraised hand to the corpse on the grating.

"That is why," he said simply, "this fellow died from horror."

His words died into emptiness. For a moment I stared at him. Then, in spite of our surroundings, in spite of the late hour, the loneliness of the street, the awful

thing beside us, I laughed.

He turned upon me with a snarl. For the first time in my life I saw M. S. convulsed with rage. His old, lined face had suddenly become savage with intensity.

"You laugh at me, Dale," he thundered. "By God, you make a mockery out of a science that I have spent more than my life in studying! You call yourself a medical man—and you are not fit to carry the name! I will wager you, man, that your laughter is not backed by courage!"

I fell away from him. Had I stood within reach, I am sure he would have struck me. Struck me! And I have been nearer to M. S. for the past ten years than any man in London. And as I retreated from his temper, he reached forward to seize my arm. I could not help but feel impressed at his grim intentness.

"Look here, Dale," he said bitterly, "I will wager you a hundred pounds that you will not spend the remainder of this night in the warehouse above you! I will wager a hundred pounds against your own

courage that you will not back your laughter by going through what this fellow has gone through. That you will not prowl through the corridors of this great structure until you have found room 4167—*and remain in that room until dawn!*"

There was no choice. I glanced at the dead man, at the face of fear and the clutching, twisted hands, and a cold dread filled me. But to refuse my friend's wager would have been to brand myself an empty coward. I had mocked him. Now, whatever the cost, I must stand ready to pay for that mockery.

"Room 4167?" I replied quietly, in a voice which I made every effort to control, lest he should discover the tremor in it. "Very well, I will do it!"

It was nearly midnight when I found myself alone, climbing a musty, winding ramp between the first and second floors of the deserted building. Not a sound, except the sharp intake of my breath and the dismal creak of the wooden stairs, echoed through that tomb of death. There was no light, not even the usual dim glow that is left to illuminate an unused corridor.

Moreover, I had brought no means of light with me—nothing but a half empty box of safety matches which, by some unholy premonition, I had forced myself to save for some future moment. The stairs were black and difficult, and I mounted them slowly, groping with both hands along the rough wall.

I had left M. S. some few moments before. In his usual decisive manner he had helped me to climb the iron grating and lower myself to the sealed alley-way on the farther side. Then, leaving him without a word, for I was bitter against the triumphant tone of his parting words, I proceeded into the darkness, fumbling forward until I had discovered the open door in the lower part of the warehouse.

And then the ramp, winding crazily upward—upward—upward, seemingly without end. I was seeking blindly for that particular room which was to be my destination. Room 4167, with its high number, could hardly be on the lower floors, and so I had stumbled upward....

It was at the entrance of the second floor corridor

that I struck the first of my desultory supply of matches, and by its light discovered a placard nailed to the wall. The thing was yellow with age and hardly legible. In the drab light of the match I had difficulty in reading it—but, as far as I can remember, the notice went something like this:

WAREHOUSE RULES

- 1.No light shall be permitted in any room or corridor, as a prevention against fire.
- 2.No person shall be admitted to rooms or corridors unless accompanied by an employee.
- 3.A watchman shall be on the premises from 7 P.M. until 6 A.M. He shall make the round of the corridors every hour during that interval, at a quarter past the hour.
- 4.Rooms are located by their numbers: the first figure in the room number indicating its floor location.

I could read no further. The match in my fingers burned to a black thread and dropped. Then, with the burnt stump still in my hand, I groped through the darkness to the bottom of the second ramp.

Room 4167, then, was on the fourth floor—the topmost floor of the structure. I must confess that the knowledge did not bring any renewed burst of courage! The top floor! Three black stair-pits would lie between me and the safety of escape. There would be no escape! No human being in the throes of fear could hope to discover that tortured outlet, could hope to grope his way through Stygian gloom down a triple ramp of black stairs. And even though he succeeded in reaching the lower corridors, there was still a blind alley-way, sealed at the outer end by a high grating of iron bars....

Escape! The mockery of it caused me to stop suddenly in my ascent and stand rigid, my whole body trembling violently.

But outside, in the gloom of the street, M. S. was waiting, waiting with that fiendish glare of triumph

that would brand me a man without courage. I could not return to face him, not though all the horrors of hell inhabited this gruesome place of mystery. And horrors must surely inhabit it, else how could one account for that fearful thing on the grating below? But I had been through horror before. I had seen a man, supposedly dead on the operating table, jerk suddenly to his feet and scream. I had seen a young girl, not long before, awake in the midst of an operation, with the knife already in her frail body. Surely, after those definite horrors, no *unknown* danger would send me cringing back to the man who was waiting so bitterly for me to return.

Those were the thoughts pregnant in my mind as I groped slowly, cautiously along the corridor of the upper floor, searching each closed door for the indistinct number 4167. The place was like the center of a huge labyrinth, a spider-web of black, repelling passages, leading into some central chamber of utter silence and blackness. I went forward with dragging steps, fighting back the dread that gripped me as I went farther and farther from the outlet of escape.

And then, after losing myself completely in the gloom, I threw aside all thoughts of return and pushed on with a careless, surface bravado, and laughed aloud.

So, at length, I reached that room of horror, secreted high in the deeper recesses of the deserted warehouse. The number—God grant I never see it again!—was scrawled in black chalk on the door—4167. I pushed the half-open barrier wide, and entered.

It was a small room, even as M. S. had forewarned me—or as the dead mind of that thing on the grate had forewarned M. S. The glow of my out-thrust match revealed a great stack of dusty boxes and crates, piled against the farther wall. Revealed, too, the black corridor beyond the entrance, and a small, upright table before me.

It was the table, and the stool beside it, that drew my attention and brought a muffled exclamation from my lips. The thing had been thrust out of its usual place, pushed aside as if some frenzied shape had lunged against it. I could make out its former position by the

marks on the dusty floor at my feet. Now it was nearer to the center of the room, and had been wrenched sidewise from its holdings. A shudder took hold of me as I looked at it. A living person, sitting on the stool before me, staring at the door, would have wrenched the table in just this manner in his frenzy to escape from the room!

The light of the match died, plunging me into a pit of gloom. I struck another and stepped closer to the table. And there, on the floor, I found two more things that brought fear to my soul. One of them was a heavy flash-lamp—a watchman's lamp—where it had evidently been dropped. Been dropped in flight! But what awful terror must have gripped the fellow to make him forsake his only means of escape through those black passages? And the second thing—a worn copy of a leather-bound book, flung open on the boards below the stool!

The flash-lamp, thank God! had not been shattered. I switched it on, directing its white circle of light over the room. This time, in the vivid glare, the room became even more unreal. Black walls, clumsy,

distorted shadows on the wall, thrown by those huge piles of wooden boxes. Shadows that were like crouching men, groping toward me. And beyond, where the single door opened into a passage of Stygian darkness, that yawning entrance was thrown into hideous detail. Had any upright figure been standing there, the light would have made an unholy phosphorescent specter out of it.

I summoned enough courage to cross the room and pull the door shut. There was no way of locking it. Had I been able to fasten it, I should surely have done so; but the room was evidently an unused chamber, filled with empty refuse. This was the reason, probably, why the watchman had made use of it as a retreat during the intervals between his rounds.

But I had no desire to ponder over the sordidness of my surroundings. I returned to my stool in silence, and stooping, picked up the fallen book from the floor. Carefully I placed the lamp on the table, where its light would shine on the open page. Then, turning the cover, I began to glance through the thing which the man before me had evidently been studying.

And before I had read two lines, the explanation of the whole horrible thing struck me. I stared dumbly down at the little book and laughed. Laughed harshly, so that the sound of my mad cackle echoed in a thousand ghastly reverberations through the dead corridors of the building.

It was a book of horror, of fantasy. A collection of weird, terrifying, supernatural tales with grotesque illustrations in funereal black and white. And the very line I had turned to, the line which had probably struck terror to that unlucky devil's soul, explained M. S.'s "decayed human form, standing in the doorway with arms extended and a frightful face of passion!" The description—the same description—lay before me, almost in my friend's words. Little wonder that the fellow on the grating below, after reading this orgy of horror, had suddenly gone mad with fright. Little wonder that the picture engraved on his dead mind was a picture of a corpse standing in the doorway of room 4167!

I glanced at that doorway and laughed. No doubt of it, it was that awful description in M. S.'s untempered

language that had made me dread my surroundings, not the loneliness and silence of the corridors about me. Now, as I stared at the room, the closed door, the shadows on the wall, I could not repress a grin.

But the grin was not long in duration. A six-hour siege awaited me before I could hear the sound of human voice again—six hours of silence and gloom. I did not relish it. Thank God the fellow before me had had foresight enough to leave his book of fantasy for my amusement!

I turned to the beginning of the story. A lovely beginning it was, outlining in some detail how a certain Jack Fulton, English adventurer, had suddenly found himself imprisoned (by a mysterious black gang of monks, or something of the sort) in a forgotten cell at the monastery of El Toro. The cell, according to the pages before me, was located in the "empty, haunted pits below the stone floors of the structure...." Lovely setting! And the brave Fulton had been secured firmly to a huge metal ring set in the farther wall, opposite the entrance.

I read the description twice. At the end of it I could not help but lift my head to stare at my own surroundings. Except for the location of the cell, I might have been in the same setting. The same darkness, same silence, same loneliness. Peculiar similarity!

And then: "Fulton lay quietly, without attempt to struggle. In the dark, the stillness of the vaults became unbearable, terrifying. Not a suggestion of sound, except the scraping of unseen rats—"

I dropped the book with a start. From the opposite end of the room in which I sat came a half inaudible scuffling noise—the sound of hidden rodents scrambling through the great pile of boxes.

Imagination? I am not sure. At the moment, I would have sworn that the sound was a definite one, that I had heard it distinctly. Now, as I recount this tale of horror, I am not sure.

But I am sure of this: There was no smile on my lips as I picked up the book again with trembling fingers and continued.

"The sound died into silence. For an eternity, the prisoner lay rigid, staring at the open door of his cell. The opening was black, deserted, like the mouth of a deep tunnel, leading to hell. And then, suddenly, from the gloom beyond that opening, came an almost noiseless, padded footfall!"

This time there was no doubt of it. The book fell from my fingers, dropped to the floor with a clatter. Yet even through the sound of its falling, I heard that fearful sound—the shuffle of a living foot! I sat motionless, staring with bloodless face at the door of room 4167. And as I stared, the sound came again, and again—*the slow tread of dragging footsteps, approaching along the black corridor without!*

I got to my feet like an automaton, swaying heavily. Every drop of courage ebbed from my soul as I stood there, one hand clutching the table, waiting....

And then, with an effort, I moved forward. My hand was outstretched to grasp the wooden handle of the door. And—I did not have the courage. Like a cowed beast I crept back to my place and slumped down on

the stool, my eyes still transfixed in a mute stare of terror.

I waited. For more than half an hour I waited, motionless. Not a sound stirred in the passage beyond that closed barrier. Not a suggestion of any living presence came to me. Then, leaning back against the wall with a harsh laugh, I wiped away the cold moisture that had trickled over my forehead into my eyes.

It was another five minutes before I picked up the book again. You call me a fool for continuing it? A fool? I tell you, even a story of horror is more comfort than a room of grotesque shadows and silence. Even a printed page is better than grim reality!

And so I read on. The story was one of suspense, madness. For the next two pages I read a cunning description of the prisoner's mental reaction. Strangely enough, it conformed precisely with my own.

"Fulton's head had fallen to his chest," the script

read. "For an endless while he did not stir, did not dare to lift his eyes. And then, after more than an hour of silent agony and suspense, the boy's head came up mechanically. Came up—and suddenly jerked rigid. A horrible scream burst from his dry lips as he stared—stared like a dead man—at the black entrance to his cell. There, standing without motion in the opening, stood a shrouded figure of death. Empty eyes, glaring with awful hate, bored into his own. Great arms, bony and rotten, extended toward him. Decayed flesh—"

I read no more. Even as I lunged to my feet, with that mad book still gripped in my hand, I heard the door of my room grind open. I screamed, screamed in utter horror at the thing I saw there. Dead? Good God, I do not know. It was a corpse, a dead human body, standing before me like some propped-up thing from the grave. A face half eaten away, terrible in its leering grin. Twisted mouth, with only a suggestion of lips, curled back over broken teeth. Hair—writhing, distorted—like a mass of moving, bloody coils. And its arms, ghastly white, bloodless, were extended toward

me, with open, clutching hands.

[Image description start: A black and white illustration showing a shriveled, dead body standing in an open doorway, arms outstretched for the horrified man standing in front of it. Image description End.]

It was alive! Alive! Even while I stood there, crouching against the wall, it stepped forward toward

me. I saw a heavy shudder pass over it, and the sound of its scraping feet burned its way into my soul. And then, with its second step, the fearful thing stumbled to its knees. The white, gleaming arms, thrown into streaks of living fire by the light of my lamp, flung violently upwards, twisting toward the ceiling. I saw the grin change to an expression of agony, of torment. And then the thing crashed upon me—dead.

With a great cry of fear I stumbled to the door. I groped out of that room of horror, stumbled along the corridor. No light. I left it behind, on the table, to throw a circle of white glare over the decayed, living-dead intruder who had driven me mad.

My return down those winding ramps to the lower floor was a nightmare of fear. I remember that I stumbled, that I plunged through the darkness like a man gone mad. I had no thought of caution, no thought of anything except escape.

And then the lower door, and the alley of gloom. I reached the grating, flung myself upon it and pressed my face against the bars in a futile effort to escape.

The same—as the fear-tortured man—who had—come before—me.

I felt strong hands lifting me up. A dash of cool air, and then the refreshing patter of falling rain.

It was the afternoon of the following day, December 6, when M. S. sat across the table from me in my own study. I had made a rather hesitant attempt to tell him, without dramatics and without dwelling on my own lack of courage, of the events of the previous night.

"You deserved it, Dale," he said quietly. "You are a medical man, nothing more, and yet you mock the beliefs of a scientist as great as Daimler. I wonder—do you still mock the Professor's beliefs?"

"That he can bring a dead man to life?" I smiled, a bit doubtfully.

"I will tell you something, Dale," said M. S. deliberately. He was leaning across the table, staring at me. "The Professor made only one mistake in his

great experiment. He did not wait long enough for the effect of his strange acids to work. He acknowledged failure too soon, and got rid of the body." He paused.

"When the Professor stored his patient away, Dale," he said quietly, "he stored it in room 4170, at the great warehouse. If you are acquainted with the place, you will know that room 4170 is directly across the corridor from 4167."

#11 Creatures of the Light, by Sophie Wenzel Ellis:

He had striven to perfect the faultless man of the future, and had succeeded—too well. For in the pitilessly cold eyes of Adam, his super-human creation, Dr. Mundson saw only contempt—and annihilation—for the human race.

In a night club of many lights and much high-pitched laughter, where he had come for an hour of forgetfulness and an execrable dinner, John Northwood was suddenly conscious that Fate had begun shuffling the cards of his destiny for a dramatic game.

First, he was aware that the singularly ugly and

deformed man at the next table was gazing at him with an intense, almost excited scrutiny. But, more disturbing than this, was the scowl of hate on the face of another man, as handsome as this other was hideous, who sat in a far corner hidden behind a broad column, with rude elbows on the table, gawking first at Northwood and then at the deformed, almost hideous man.

Northwood's blood chilled over the expression on the handsome, fair-haired stranger's perfectly carved face. If a figure in marble could display a fierce, unnatural passion, it would seem no more eldritch than the hate in the icy blue eyes.

It was not a new experience for Northwood to be stared at: he was not merely a good-looking young fellow of twenty-five, he was scenery, magnificent and compelling. Furthermore, he had been in the public eye for years, first as a precocious child and, later, as a brilliant young scientist. Yet, for all his experience with hero worshippers to put an adamantine crust on his sensibilities, he grew warm-eared under the gaze of these two strangers—this hunchback with a face

like a grotesque mask in a Greek play, this other who, even handsomer than himself, chilled the blood queerly with the cold perfection of his godlike masculine beauty.

Northwood sensed something familiar about the hunchback. Somewhere he had seen that huge, round, intelligent face splattered with startling features. The very breadth of the man's massive brow was not altogether unknown to him, nor could Northwood look into the mournful, near-sighted black eyes without trying to recall when and where he had last seen them.

But this other of the marble-perfect nose and jaw, the blond, thick-waved hair, was totally a stranger, whom Northwood fervently hoped he would never know too well.

Trying to analyze the queer repugnance that he felt for this handsome, boldly staring fellow, Northwood decided: "He's like a newly-made wax figure endowed with life."

Shivering over his own fantastic thought, he again glanced swiftly at the hunchback, who he noticed was playing with his coffee, evidently to prolong the meal.

One year of calm-headed scientific teaching in a famous old eastern university had not made him callous to mysteries. Thus, with a feeling of high adventure, he finished his supper and prepared to go. From the corner of his eye, he saw the hunchback leave his seat, while the handsome man behind the column rose furtively, as though he, too, intended to follow.

Northwood was out in the dusky street about thirty seconds, when the hunchback came from the foyer. Without apparently noticing Northwood, he hailed a taxi. For a moment, he stood still, waiting for the taxi to pull up at the curb. Standing thus, with the street light limning every unnatural angle of his twisted body and every queer abnormality of his huge features, he looked almost repulsive.

On his way to the taxi, his thick shoulder jostled the younger man. Northwood felt something strike his

foot, and, stooping in the crowded street, picked up a black leather wallet.

"Wait!" he shouted as the hunchback stepped into the waiting taxi.

But the man did not falter. In a moment, Northwood lost sight of him as the taxi moved away.

He debated with himself whether or not he should attempt to follow. And while he stood thus in indecision, the handsome stranger approached him.

"Good evening to you," he said curtly. His rich, musical voice, for all its deepness, held a faint hint of the tremulous, birdlike notes heard in the voice of a young child who has not used his vocal chords long enough for them to have lost their exquisite newness.

"Good evening," echoed Northwood, somewhat uncertainly. A sudden aura of repulsion swept coldly over him. Seen close, with the brilliant light of the street directly on his too perfect face, the man was more sinister than in the café. Yet Northwood,

struggling desperately for a reason to explain his violent dislike, could not discover why he shrank from this splendid creature, whose eyes and flesh had a new, fresh appearance rarely seen except in very young boys.

"I want what you picked up," went on the stranger.

"It isn't yours!" Northwood flashed back. Ah! that effluvium of hatred which seemed to weave a tangible net around him!

"Nor is it yours. Give it to me!"

"You're insolent, aren't you?"

"If you don't give it to me, you will be sorry." The man did not raise his voice in anger, yet the words whipped Northwood with almost physical violence. "If he knew that I saw everything that happened in there—that I am talking to you at this moment—he would tremble with fear."

"But you can't intimidate me."

"No?" For a long moment, the cold blue eyes held his contemptuously. "No? I can't frighten you—you worm of the Black Age?"

Before Northwood's horrified sight, he vanished; vanished as though he had turned suddenly to air and floated away.

The street was not crowded at that time, and there was no pressing group of bodies to hide the splendid creature. Northwood gawked stupidly, mouth half open, eyes searching wildly everywhere. The man was gone. He had simply disappeared, in this sane, electric-lighted street.

Suddenly, close to Northwood's ear, grated a derisive laugh. "I can't frighten you?" From nowhere came that singularly young-old voice.

As Northwood jerked his head around to meet blank space, a blow struck the corner of his mouth. He felt the warm blood run over his chin.

"I could take that wallet from you, worm, but you may

keep it, and see me later. But remember this—the thing inside never will be yours."

The words fell from empty air.

For several minutes, Northwood waited at the spot, expecting another demonstration of the abnormal, but nothing else occurred. At last, trembling violently, he wiped the thick moisture from his forehead and dabbed at the blood which he still felt on his chin.

But when he looked at his handkerchief, he muttered:

"Well, I'll be jiggered!"

The handkerchief bore not the slightest trace of blood.

Under the light in his bedroom, Northwood examined the wallet. It was made of alligator skin, clasped with a gold signet that bore the initial M. The first pocket was empty; the second yielded an object that sent a warm flush to his face.

It was the photograph of a gloriously beautiful girl, so seductively lovely that the picture seemed almost to be alive. The short, curved upper lip, the full, delicately voluptuous lower, parted slightly in a smile that seemed to linger in every exquisite line of her face. She looked as though she had just spoken passionately, and the spirit of her words had inspired her sweet flesh and eyes.

Northwood turned his head abruptly and groaned, "Good Heavens!"

He had no right to palpitate over the picture of an unknown beauty. Only a month ago, he had become engaged to a young woman whose mind was as brilliant as her face was plain. Always he had vowed that he would never marry a pretty girl, for he detested his own masculine beauty sincerely.

He tried to grasp a mental picture of Mary Burns, who had never stirred in him the emotion that this smiling picture invoked. But, gazing at the picture, he could not remember how his fiancée looked.

Suddenly the picture fell from his fingers and dropped to the floor on its face, revealing an inscription on the back. In a bold, masculine hand, he read: "Your future wife."

"Some lucky fellow is headed for a life of bliss," was his jealous thought.

He frowned at the beautiful face. What was this girl to that hideous hunchback? Why did the handsome stranger warn him, "*The thing inside never will be yours?*"

Again he turned eagerly to the wallet.

In the last flap he found something that gave him another surprise: a plain white card on which a name and address were written by the same hand that had penned the inscription on the picture.

Emil Mundson, Ph. D.,
44-1/2 Indian Court

Emil Mundson, the electrical wizard and

distinguished scientific writer, friend of the professor of science at the university where Northwood was an assistant professor; Emil Mundson, whom, a week ago, Northwood had yearned mightily to meet.

Now Northwood knew why the hunchback's intelligent, ugly face was familiar to him. He had seen it pictured as often as enterprising news photographers could steal a likeness from the oversensitive scientist, who would never sit for a formal portrait.

Even before Northwood had graduated from the university where he now taught, he had been avidly interested in Emil Mundson's fantastic articles in scientific journals. Only a week ago, Professor Michael had come to him with the current issue of New Science, shouting excitedly:

"Did you read this, John, this article by Emil Mundson?" His shaking, gnarled old fingers tapped the open magazine.

Northwood seized the magazine and looked avidly at

the title of the article, "Creatures of the Light."

"No, I haven't read it," he admitted. "My magazine hasn't come yet."

"Run through it now briefly, will you? And note with especial care the passages I have marked. In fact, you needn't bother with anything else just now. Read this—and this—and this." He pointed out penciled paragraphs.

Northwood read:

Man always has been, always will be a creature of the light. He is forever reaching for some future point of perfected evolution which, even when his most remote ancestor was a fish creature composed of a few cells, was the guiding power that brought him up from the first stinking sea and caused him to create gods in his own image.

It is this yearning for perfection which sets man apart from all other life, which made him *man*

even in the rudimentary stages of his development. He was man when he wallowed in the slime of the new world and yearned for the air above. He will still be man when he has evolved into that glorious creature of the future whose body is deathless and whose mind rules the universe.

Professor Michael, looking over Northwood's shoulder, interrupted the reading:

"*Man always has been man*," he droned emphatically. "That's not original with friend Mundson, of course; yet it is a theory that has not received sufficient investigation." He indicated another marked paragraph. "Read this thoughtfully, John. It's the crux of Mundson's thought."

Northwood continued:

Since the human body is chemical and electrical, increased knowledge of its powers and limitations will enable us to work with Nature in her sublime but infinitely slow

processes of human evolution. We need not wait another fifty thousand years to be godlike creatures. Perhaps even now we may be standing at the beginning of the splendid bridge that will take us to that state of perfected evolution when we shall be Creatures who have reached the Light.

Northwood looked questioningly at the professor.
"Queer, fantastic thing, isn't it?"

Professor Michael smoothed his thin, gray hair with his dried-out hand. "Fantastic?" His intellectual eyes behind the thick glasses sought the ceiling. "Who can say? Haven't you ever wondered why all parents expect their children to be nearer perfection than themselves, and why is it a natural impulse for them to be willing to sacrifice themselves to better their offspring?" He paused and moistened his pale, wrinkled lips. "Instinct, Northwood. We Creatures of the Light know that our race shall reach that point in evolution when, as perfect creatures, we shall rule all matter and live forever." He punctuated the last words with blows on the table.

Northwood laughed dryly. "How many thousands of years are you looking forward, Professor?"

The professor made an obscure noise that sounded like a smothered sniff. "You and I shall never agree on the point that mental advancement may wipe out physical limitations in the human race, perhaps in a few hundred years. It seems as though your profound admiration for Dr. Mundson would win you over to this pet theory."

"But what sane man can believe that even perfectly developed beings, through mental control, could overcome Nature's fixed laws?"

"We don't know! We don't know!" The professor slapped the magazine with an emphatic hand. "Emil Mundson hasn't written this article for nothing. He's paving the way for some announcement that will startle the scientific world. I know him. In the same manner he gave out veiled hints of his various brilliant discoveries and inventions long before he offered them to the world."

"But Dr. Mundson is an electrical wizard. He would not be delving seriously into the mysteries of evolution, would he?"

"Why not?" The professor's wizened face screwed up wisely. "A year ago, when he was back from one of those mysterious long excursions he takes in that weirdly different aircraft of his, about which he is so secretive, he told me that he was conducting experiments to prove his belief that the human brain generates electric current, and that the electrical impulses in the brain set up radioactive waves that some day, among other miracles, will make thought communication possible. Perfect man, he says, will perform mental feats which will give him complete mental domination over the physical."

Northwood finished reading and turned thoughtfully to the window. His profile in repose had the straight-nosed, full-lipped perfection of a Greek coin. Old, wizened Professor Michael, gazing at him covertly, smothered a sigh.

"I wish you knew Dr. Mundson," he said. "He, the

ugliest man in the world, delights in physical perfection. He would revel in your splendid body and brilliant mind."

Northwood blushed hotly. "You'll have to arrange a meeting between us."

"I have." The professor's thin, dry lips pursed comically. "He'll drop in to see you within a few days."

And now John Northwood sat holding Dr. Mundson's card and the wallet which the scientist had so mysteriously dropped at his feet.

Here was high adventure, perhaps, for which he had been singled out by the famous electrical wizard. While excitement mounted in his blood, Northwood again examined the photograph. The girl's strange eyes, odd in expression rather than in size or shape, seemed to hold him. The young man's breath came quicker.

"It's a challenge," he said softly. "It won't hurt to see what it's all about."

His watch showed eleven o'clock. He would return the wallet that night. Into his coat pocket he slipped a revolver. One sometimes needed weapons in Indian Court.

He took a taxi, which soon turned from the well-lighted streets into a section where squalid houses crowded against each other, and dirty children swarmed in the streets in their last games of the day.

Indian Court was little more than an alley, dark and evil smelling.

The chauffeur stopped at the entrance and said:

"If I drive in, I'll have to back out, sir. Number forty-four and a half is the end house, facing the entrance."

"You've been here before?" asked Northwood.

"Last week I drove the queerest bird here—a fellow as good-looking as you, who had me follow the taxi occupied by a hunchback with a face like Old Nick." The man hesitated and went on haltingly: "It might

sound goofy, mister, but there was something funny about my fare. He jumped out, asked me the charge, and, in the moment I glanced at my taxi-meter, he disappeared. Yes, sir. Vanished, owing me four dollars, six bits. It was almost ghostlike, mister."

Northwood laughed nervously and dismissed him. He found his number and knocked at the dilapidated door. He heard a sudden movement in the lighted room beyond, and the door opened quickly.

Dr. Mundson faced him.

"I knew you'd come!" he said with a slight Teutonic accent. "Often I'm not wrong in sizing up my man. Come in."

Northwood cleared his throat awkwardly. "You dropped your wallet at my feet, Dr. Mundson. I tried to stop you before you got away, but I guess you did not hear me."

He offered the wallet, but the hunchback waved it aside.

"A ruse, of course," he confessed. "It just was my way of testing what your Professor Michael told about you—that you are extraordinarily intelligent, virile, and imaginative. Had you sent the wallet to me, I should have sought elsewhere for my man. Come in."

Northwood followed him into a living room evidently recently furnished in a somewhat hurried manner. The furniture, although rich, was not placed to best advantage. The new rug was a trifle crooked on the floor, and the lamp shades clashed in color with the other furnishings.

Dr. Mundson's intense eyes swept over Northwood's tall, slim body.

"Ah, you're a man!" he said softly. "You are what all men would be if we followed Nature's plan that only the fit shall survive. But modern science is permitting the unfit to live and to mix their defective beings with the developing race!" His huge fist gesticulated madly. "Fools! Fools! They need me and perfect men like you."

"Why?"

"Because you can help me in my plan to populate the earth with a new race of godlike people. But don't question me too closely now. Even if I should explain, you would call me insane. But watch; gradually I shall unfold the mystery before you, so that you will believe."

He reached for the wallet that Northwood still held, opened it with a monstrous hand, and reached for the photograph. "She shall bring you love. She's more beautiful than a poet's dream."

A warm flush crept over the young man's face.

"I can easily understand," he said, "how a man could love her, but for me she comes too late."

"Pooh! Fiddlesticks!" The scientist snapped his fingers. "This girl was created for you. That other—you will forget her the moment you set eyes on the sweet flesh of this Athalia. She is an houri from Paradise—a maiden of musk and incense." He held

the girl's photograph toward the young man. "Keep it. She is yours, if you are strong enough to hold her."

Northwood opened his card case and placed the picture inside, facing Mary's photograph. Again the warning words of the mysterious stranger rang in his memory: "*The thing inside never will be yours.*"

"Where to," he said eagerly; "and when do we start?"

"To the new Garden of Eden," said the scientist, with such a beatific smile that his face was less hideous.

"We start immediately. I have arranged with Professor Michael for you to go."

Northwood followed Dr. Mundson to the street and walked with him a few blocks to a garage where the scientist's motor car waited.

"The apartment in Indian Court is just a little eccentricity of mine," explained Dr. Mundson. "I need people in my work, people whom I must select through swift, sure tests. The apartment comes in handy, as to-night."

Northwood scarcely noted where they were going, or how long they had been on the way. He was vaguely aware that they had left the city behind, and were now passing through farms bathed in moonlight.

At last they entered a path that led through a bit of woodland. For half a mile the path continued, and then ended at a small, enclosed field. In the middle of this rested a queer aircraft. Northwood knew it was a flying machine only by the propellers mounted on the top of the huge ball-shaped body. There were no wings, no birdlike hull, no tail.

"It looks almost like a little world ready to fly off into space," he commented.

"It is just about that." The scientist's squat, bunched-out body, settled squarely on long, thin, straddled legs, looked gnomelike in the moonlight. "One cannot copy flesh with steel and wood, but one can make metal perform magic of which flesh is not capable. My sun-ship is not a mechanical reproduction of a bird. It is—but, climb in, young friend."

Northwood followed Dr. Mundson into the aircraft. The moment the scientist closed the metal door behind them, Northwood was instantly aware of some concealed horror that vibrated through his nerves. For one dreadful moment, he expected some terrific agent of the shadows that escaped the electric lights to leap upon him. And this was odd, for nothing could be saner than the globular interior of the aircraft, divided into four wedge-shaped apartments.

Dr. Mundson also paused at the door, puzzled, hesitant.

"Someone has been here!" he exclaimed. "Look, Northwood! The bunk has been occupied—the one in this cabin I had set aside for you."

He pointed to the disarranged bunk, where the impression of a head could still be seen on a pillow.

"A tramp, perhaps."

"No! The door was locked, and, as you saw, the fence around this field was protected with barbed wire.

There's something wrong. I felt it on my trip here all the way, like someone watching me in the dark. And don't laugh! I have stopped laughing at all things that seem unnatural. You don't know what is natural."

Northwood shivered. "Maybe someone is concealed about the ship."

"Impossible. Me, I thought so, too. But I looked and looked, and there was nothing."

All evening Northwood had burned to tell the scientist about the handsome stranger in the Mad Hatter Club. But even now he shrank from saying that a man had vanished before his eyes.

Dr. Mundson was working with a succession of buttons and levers. There was a slight jerk, and then the strange craft shot up, straight as a bullet from a gun, with scarcely a sound other than a continuous whistle.

"The vertical rising aircraft perfected," explained Dr. Mundson. "But what would you think if I told you that

there is not an ounce of gasoline in my heavier-than-air craft?"

"I shouldn't be surprised. An electrical genius would seek for a less obsolete source of power."

In the bright flare of the electric lights, the scientist's ugly face flushed. "The man who harnesses the sun rules the world. He can make the desert places bloom, the frozen poles balmy and verdant. You, John Northwood, are one of the very few to fly in a machine operated solely by electrical energy from the sun's rays."

"Are you telling me that this airship is operated with power from the sun?"

"Yes. And I cannot take the credit for its invention." He sighed. "The dream was mine, but a greater brain developed it—a brain that may be greater than I suspect." His face grew suddenly graver.

A little later Northwood said: "It seems that we must be making fabulous speed."

"Perhaps!" Dr. Mundson worked with the controls.

"Here, I've cut her down to the average speed of the ordinary airplane. Now you can see a bit of the night scenery."

Northwood peeped out the thick glass porthole. Far below, he saw two tiny streaks of light, one smooth and stationery, the other wavering as though it were a reflection in water.

"That can't be a lighthouse!" he cried.

The scientist glanced out. "It is. We're approaching the Florida Keys."

"Impossible! We've been traveling less than an hour."

"But, my young friend, do you realize that my sun-ship has a speed of over one thousand miles an hour, how much over I dare not tell you?"

Throughout the night, Northwood sat beside Dr. Mundson, watching his deft fingers control the simple-looking buttons and levers. So fast was their

flight now that, through the portholes, sky and earth looked the same: dark gray films of emptiness. The continuous weird whistle from the hidden mechanism of the sun-ship was like the drone of a monster insect, monotonous and soporific during the long intervals when the scientist was too busy with his controls to engage in conversation.

For some reason that he could not explain, Northwood had an aversion to going into the sleeping apartment behind the control room. Then, towards morning, when the suddenly falling temperature struck a biting chill throughout the sun-ship, Northwood, going into the cabin for fur coats, discovered why his mind and body shrank in horror from the cabin.

After he had procured the fur coats from a closet, he paused a moment, in the privacy of the cabin, to look at Athalia's picture. Every nerve in his body leaped to meet the magnetism of her beautiful eyes. Never had Mary Burns stirred emotion like this in him. He hung over Mary's picture, wistfully, hoping almost prayerfully that he could react to her as he did to

Athalia; but her pale, over-intellectual face left him cold.

"Cad!" he ground out between his teeth. "Forgetting her so soon!"

The two pictures were lying side by side on a little table. Suddenly an obscure noise in the room caught his attention. It was more vibration than noise, for small sounds could scarcely be heard above the whistle of the sun-ship. A slight compression of the air against his neck gave him the eery feeling that someone was standing close behind him. He wheeled and looked over his shoulder. Half ashamed of his startled gesture, he again turned to his pictures. Then a sharp cry broke from him.

Athalia's picture was gone.

He searched for it everywhere in the room, in his own pockets, under the furniture. It was nowhere to be found.

In sudden, overpowering horror, he seized the fur

coats and returned to the control room.

Dr. Mundson was changing the speed.

"Look out the window!" he called to Northwood.

The young man looked and started violently. Day had come, and now that the sun-ship was flying at a moderate speed, the ocean beneath was plainly visible; and its entire surface was covered with broken floes of ice and small, ragged icebergs. He seized a telescope and focused it below. A typical polar scene met his eyes: penguins strutted about on cakes of ice, a whale blowing in the icy water.

"A part of the Antarctic that has never been explored," said Dr. Mundson; "and there, just showing on the horizon, is the Great Ice Barrier." His characteristic smile lighted the morose black eyes. "I am enough of the dramatist to wish you to be impressed with what I shall show you within less than an hour. Accordingly, I shall make a landing and let you feel polar ice under your feet."

After less than a minute's search, Dr. Mundson found a suitable place on the ice for a landing, and, with a few deft manipulations of the controls, brought the sun-ship swooping down like an eagle on its prey.

For a long moment after the scientist had stepped out on the ice, Northwood paused at the door. His feet were chained by a strange reluctance to enter this white, dead wilderness of ice. But Dr. Mundson's impatient, "Ready?" drew from him one last glance at the cozy interior of the sun-ship before he, too, went out into the frozen stillness.

They left the sun-ship resting on the ice like a fallen silver moon, while they wandered to the edge of the Barrier and looked at the gray, narrow stretch of sea between the ice pack and the high cliffs of the Barrier. The sun of the commencing six-months' Antarctic day was a low, cold ball whose slanted rays struck the ice with blinding whiteness. There were constant falls of ice from the Barrier, which thundered into the ocean amid great clouds of ice smoke that lingered like wraiths around the edge. It was a scene of loneliness and waiting death.

"What's that?" exclaimed the scientist suddenly.

Out of the white silence shrilled a low whistle, a familiar whistle. Both men wheeled toward the sun-ship.

Before their horrified eyes, the great sphere jerked and glided up, and swerved into the heavens.

Up it soared; then, gaining speed, it swung into the blue distance until, in a moment, it was a tiny star that flickered out even as they watched.

Both men screamed and cursed and flung up their arms despairingly. A penguin, attracted by their cries, waddled solemnly over to them and regarded them with manlike curiosity.

"Stranded in the coldest spot on earth!" groaned the scientist.

"Why did it start itself, Dr. Mundson!" Northwood narrowed his eyes as he spoke.

"It didn't!" The scientist's huge face, red from cold, quivered with helpless rage. "Human hands started it."

"What! Whose hands?"

"*Ach!* Do I know?" His Teutonic accent grew more pronounced, as it always did when he was under emotional stress. "Somebody whose brain is better than mine. Somebody who found a way to hide away from our eyes. *Ach, Gott!* Don't let me think!"

His great head sank between his shoulders, giving him, in his fur suit, the grotesque appearance of a friendly brown bear.

"Doctor Mundson," said Northwood suddenly, "did you have an enemy, a man with the face and body of a pagan god—a great, blond creature with eyes as cold and cruel as the ice under our feet?"

"Wait!" The huge round head jerked up. "How do you know about Adam? You have not seen him, won't see him until we arrive at our destination."

"But I have seen him. He was sitting not thirty feet from you in the Mad Hatter's Club last night. Didn't you know? He followed me to the street, spoke to me, and then—" Northwood stopped. How could he let the insane words pass his lips?

"Then, what? Speak up!"

Northwood laughed nervously. "It sounds foolish, but I saw him vanish like that." He snapped his fingers.

"*Ach, Gott!*" All the ruddy color drained from the scientist's face. As though talking to himself, he continued:

"Then it is true, as he said. He has crossed the bridge. He has reached the Light. And now he comes to see the world he will conquer—came unseen when I refused my permission."

He was silent for a long time, pondering. Then he turned passionately to Northwood.

"John Northwood, kill me! I have brought a new

horror into the world. From the unborn future, I have snatched a creature who has reached the Light too soon. Kill me!" He bowed his great, shaggy head.

"What do you mean, Dr. Mundson: that this Adam has arrived at a point in evolution beyond this age?"

"Yes. Think of it! I visioned godlike creatures with the souls of gods. But, Heaven help us, man always will be man: always will lust for conquest. You and I, Northwood, and all others are barbarians to Adam. He and his kind will do what men always do to barbarians—conquer and kill."

"Are there more like him?" Northwood struggled with a smile of unbelief.

"I don't know. I did not know that Adam had reached a point so near the ultimate. But you have seen. Already he is able to set aside what we call natural laws."

Northwood looked at the scientist closely. The man was surely mad—mad in this desert of white death.

"Come!" he said cheerfully. "Let's build an Eskimo snow house. We can live on penguins for days. And who knows what may rescue us?"

For three hours the two worked at cutting ice blocks. With snow for mortar, they built a crude shelter which enabled them to rest out of the cold breath of the spiral polar winds that blew from the south.

Dr. Mundson was sitting at the door of their hut, moodily pulling at his strong, black pipe. As though a fit had seized him, he leaped up and let his pipe fall to the ice.

"Look!" he shouted. "The sun-ship!"

It seemed but a moment before the tiny speck on the horizon had swept overhead, a silver comet on the grayish-blue polar sky. In another moment it had swooped down, eaglewise, scarcely fifty feet from the ice hut.

Dr. Mundson and Northwood ran forward. From the metal sphere stepped the stranger of the Mad Hatter

Club. His tall, straight form, erect and slim, swung toward them over the ice.

"Adam!" shouted Dr. Mundson. "What does this mean? How dare you!"

Adam's laugh was like the happy demonstration of a boy. "So? You think you still are master? You think I returned because I revered you yet?" Hate shot viciously through the freezing blue eyes. "You worm of the Black Age!"

Northwood shuddered. He had heard those strange words addressed to himself scarcely more than twelve hours ago.

Adam was still speaking: "With a thought I could annihilate you where you are standing. But I have use for you. Get in." He swept his hand to the sun-ship.

Both men hesitated. Then Northwood strode forward until he was within three feet of Adam. They stood thus, eyeing each other, two splendid beings, one blond as a Viking, the other dark and vital.

"Just what is your game?" demanded Northwood.

The icy eyes shot forth a gleam like lightning. "I needn't tell you, of course, but I may as well let you suffer over the knowledge." He curled his lips with superb scorn. "I have one human weakness. I want Athalia." The icy eyes warmed for a fleeting second. "She is anticipating her meeting with you—bah! The taste of these women of the Black Age! I could kill you, of course; but that would only inflame her. And so I take you to her, thrust you down her throat. When she sees you, she will fly to me." He spread his magnificent chest.

"Adam!" Dr. Mundson's face was dark with anger.

"What of Eve?"

"Who are you to question my actions? What a fool you were to let me, whom you forced into life thousands of years too soon, grow more powerful than you! Before I am through with all of you petty creatures of the Black Age, you will call me more terrible than your Jehovah! For see what you have called forth from unborn time."

He vanished.

Before the startled men could recover from the shock of it, the vibrant, too-new voice went on:

"I am sorry for you, Mundson, because, like you, I need specimens for my experiments. What a splendid specimen you will be!" His laugh was ugly with significance. "Get in, worms!"

Unseen hands cuffed and pushed them into the sun-ship.

Inside, Dr. Mundson stumbled to the control room, white and drawn of face, his great brain seemingly paralyzed by the catastrophe.

"You needn't attempt tricks," went on the voice. "I am watching you both. You cannot even hide your thoughts from me."

And thus began the strange continuation of the journey. Not once, in that wild half-hour's rush over the polar ice clouds, did they see Adam. They saw and

heard only the weird signs of his presence: a puffing cigar hanging in midair, a glass of water swinging to unseen lips, a ghostly voice hurling threats and insults at them.

Once the scientist whispered: "Don't cross him; it is useless. John Northwood, you'll have to fight a demigod for your woman!"

Because of the terrific speed of the sun-ship, Northwood could distinguish nothing of the topographical details below. At the end of half-an-hour, the scientist slowed enough to point out a tall range of snow-covered mountains, over which hovered a play of colored lights like the *aurora australis*.

"Behind those mountains," he said, "is our destination."

Almost in a moment, the sun-ship had soared over the peaks. Dr. Mundson kept the speed low enough for Northwood to see the splendid view below.

In the giant cup formed by the encircling mountain range was a green valley of tropical luxuriance.

Stretches of dense forest swept half up the mountains and filled the valley cup with tangled verdure. In the center, surrounded by a broad field and a narrow ring of woods, towered a group of buildings. From the largest, which was circular, came the auroralike radiance that formed an umbrella of light over the entire valley.

"Do I guess right," said Northwood, "that the light is responsible for this oasis in the ice?"

"Yes," said Dr. Mundson. "In your American slang, it is canned sunshine containing an overabundance of certain rays, especially the Life Ray, which I have isolated." He smiled proudly. "You needn't look startled, my friend. Some of the most common things store sunlight. On very dark nights, if you have sharp eyes, you can see the radiance given off by certain flowers, which many naturalists say is trapped sunshine. The familiar nasturtium and the marigold opened for me the way to hold sunshine against the long polar night, for they taught me how to apply the

Einstein theory of bent light. Stated simply, during the polar night, when the sun is hidden over the rim of the world, we steal some of his rays; during the polar day we concentrate the light."

"But could stored sunshine alone give enough warmth for the luxuriant growth of those jungles?"

"An overabundance of the Life Ray is responsible for the miraculous growth of all life in New Eden. The Life Ray is Nature's most powerful force. Yet Nature is often niggardly and paradoxical in her use of her powers. In New Eden, we have forced the powers of creation to take ascendancy over the powers of destruction."

At Northwood's sudden start, the scientist laughed and continued: "Is it not a pity that Nature, left alone, requires twenty years to make a man who begins to die in another ten years? Such waste is not tolerated in New Eden, where supermen are younger than babes and—"

"Come, worms; let's land."

It was Adam's voice. Suddenly he materialized, a blond god, whose eyes and flesh were too new.

They were in a world of golden skylight, warmth and tropical vegetation. The field on which they had landed was covered with a velvety green growth of very soft, fine-bladed grass, sprinkled with tiny, star-shaped blue flowers. A balmy, sweet-scented wind, downy as the breeze of a dream, blew gently along the grass and tingled against Northwood's skin refreshingly. Almost instantly he had the sensation of perfect well being, and this feeling of physical perfection was part of the ecstasy that seemed to pervade the entire valley. Grass and breeze and golden skylight were saturated with a strange ether of joyousness.

At one end of the field was a dense jungle, cut through by a road that led to the towering building from which, while above in the sun-ship, they had seen the golden light issue.

From the jungle road came a man and a woman, large, handsome people, whose flesh and eyes had the

sinister newness of Adam's. Even before they came close enough to speak, Northwood was aware that while they seemed of Adam's breed, they were yet unlike him. The difference was psychical rather than physical; they lacked the aura of hate and horror that surrounded Adam. The woman drew Adam's head down and kissed him affectionately on both cheeks.

Adam, from his towering height, patted her shoulder impatiently and said: "Run on back to the laboratory, grandmother. We're following soon. You have some new human embryos, I believe you told me this morning."

"Four fine specimens, two of them being your sister's twins."

"Splendid! I was sure that creation had stopped with my generation. I must see them." He turned to the scientist and Northwood. "You needn't try to leave this spot. Of course I shall know instantly and deal with you in my own way. Wait here."

He strode over the emerald grass on the heels of the

woman.

Northwood asked: "Why does he call that girl grandmother?"

"Because she is his ancestress." He stirred uneasily.

"She is of the first generation brought forth in the laboratory, and is no different from you or I, except that, at the age of five years, she is the ancestress of twenty generations."

"My God!" muttered Northwood.

"Don't start being horrified, my friend. Forget about so-called natural laws while you are in New Eden. Remember, here we have isolated the Life Ray. But look! Here comes your Athalia!"

Northwood gazed covertly at the beautiful girl approaching them with a rarely graceful walk. She was tall, slender, round-bosomed, narrow-hipped, and she held her lovely body in the erect poise of splendid health. Northwood had a confused realization of uncovered bronzy hair, drawn to the back of a white

neck in a bunch of short curls; of immense soft black eyes; lips the color of blood, and delicate, plump flesh on which the golden skylight lingered graciously. He was instantly glad to see that while she possessed the freshness of young girlhood, her skin and eyes did not have the horrible newness of Adam's.

When she was still twenty feet distant, Northwood met her eyes and she smiled shyly. The rich, red blood ran through her face; and he, too, flushed.

She went to Dr. Mundson and, placing her hands on his thick shoulders, kissed him affectionately.

"I've been worried about you, Daddy Mundson." Her rich contralto voice matched her exotic beauty. "Since you and Adam had that quarrel the day you left, I did not see him until this morning, when he landed the sun-ship alone."

"And you pleaded with him to return for us?"

"Yes." Her eyes drooped and a hot flush swept over her face.

Dr. Mundson smiled. "But I'm back now, Athalia, and I've brought some one whom I hope you will be glad to know."

Reaching for her hand, he placed it simply in Northwood's.

"This is John, Athalia. Isn't he handsomer than the pictures of him which I televisioned to you? God bless both of you."

He walked ahead and turned his back.

A magical half hour followed for Northwood and Athalia. The girl told him of her past life, how Dr. Mundson had discovered her one year ago working in a New York sweat shop, half dead from consumption. Without friends, she was eager to follow the scientist to New Eden, where he promised she would recover her health immediately.

"And he was right, John," she said shyly. "The Life Ray, that marvelous energy ray which penetrates to the utmost depths of earth and ocean, giving to the

cells of all living bodies the power to grow and remain animate, has been concentrated by Dr. Mundson in his stored sunshine. The Life Ray healed me almost immediately."

Northwood looked down at the glorious girl beside him, whose eyes already fluttered away from his like shy black butterflies. Suddenly he squeezed the soft hand in his and said passionately:

"Athalia! Because Adam wants you and will get you if he can, let us set aside all the artificialities of civilization. I have loved you madly ever since I saw your picture. If you can say the same to me, it will give me courage to face what I know lies before me."

Athalia, her face suddenly tender, came closer to him.

"John Northwood, I love you."

Her red lips came temptingly close; but before he could touch them, Adam suddenly pushed his body between him and Athalia. Adam was pale, and all the iciness was gone from his blue eyes, which were deep

and dark and very human. He looked down at Athalia, and she looked up at him, two handsome specimens of perfect manhood and womanhood.

"Fast work, Athalia!" The new vibrant voice was strained. "I was hoping you would be disappointed in him, especially after having been wooed by me this morning. I could take you if I wished, of course; but I prefer to win you in the ancient manner. Dismiss him!" He jerked his thumb over his shoulder in Northwood's direction.

Athalia flushed vividly and looked at him almost compassionately. "I am not great enough for you, Adam. I dare not love you."

Adam laughed, and still oblivious of Northwood and Dr. Mundson, folded his arms over his breast. With the golden skylight on his burnished hair, he was a valiant, magnificent spectacle.

"Since the beginning of time, gods and archangels have looked upon the daughters of men and found them fair. Mate with me, Athalia, and I, fifty thousand

years beyond the creature Mundson has selected for you, will make you as I am, the deathless overlord of life and all nature."

He drew her hand to his bosom.

For one dark moment, Northwood felt himself seared by jealousy, for, through the plump, sweet flesh of Athalia's face, he saw the red blood leap again. How could she withhold herself from this splendid superman?

But her answer, given with faltering voice, was the old, simple one: "I have promised him, Adam. I love him." Tears trembled on her thick lashes.

"So! I cannot get you in the ancient manner. Now I'll use my own."

He seized her in his arms crushed her against him, and, laughing over her head at Northwood, bent his glistening head and kissed her on the mouth.

There was a blinding flash of blue electric sparks—

and nothing else. Both Adam and Athalia had vanished.

Adam's voice came in a last mocking challenge: "I shall be what no other gods before me have been—a good sport. I'll leave you both to your own devices, until I want you again."

White-lipped and trembling, Northwood groaned: "What has he done now?"

Dr. Mundson's great head drooped. "I don't know. Our bodies are electric and chemical machines; and a super intelligence has discovered new laws of which you and I are ignorant."

"But Athalia...."

"She is safe; he loves her."

"Loves her!" Northwood shivered. "I cannot believe that those freezing eyes could ever look with love on a woman."

"Adam is a man. At heart he is as human as the first man-creature that wallowed in the new earth's slime." His voice dropped as though he were musing aloud. "It might be well to let him have Athalia. She will help to keep vigor in the new race, which would stop reproducing in another few generations without the injection of Black Age blood."

"Do you want to bring more creatures like Adam into the world?" Northwood flung at him. "You have tampered with life enough, Dr. Mundson. But, although Adam has my sympathy, I'm not willing to turn Athalia over to him."

"Well said! Now come to the laboratory for chemical nourishment and rest under the Life Ray."

They went to the great circular building from whose highest tower issued the golden radiance that shamed the light of the sun, hanging low in the northeast.

"John Northwood," said Dr. Mundson, "with that laboratory, which is the center of all life in New Eden, we'll have to whip Adam. He gave us what he called a

'sporting chance' because he knew that he is able to send us and all mankind to a doom more terrible than hell. Even now we might be entering some hideous trap that he has set for us."

They entered by a side entrance and went immediately to what Dr. Mundson called the Rest Ward. Here, in a large room, were ranged rows of cots, on many of which lay men basking in the deep orange flood of light which poured from individual lamps set above each cot.

"It is the Life Ray!" said Dr. Mundson reverently. "The source of all growth and restoration in Nature. It is the power that bursts open the seed and brings forth the shoot, that increases the shoot into a giant tree. It is the same power that enables the fertilized ovum to develop into an animal. It creates and recreates cells almost instantly; accordingly, it is the perfect substitute for sleep. Stretch out, enjoy its power; and while you rest, eat these nourishing tablets."

Northwood lay on a cot, and Dr. Mundson turned the Life Ray on him. For a few minutes a delicious

drowsiness fell upon him, producing a spell of perfect peace which the cells of his being seemed to drink in. For another delirious, fleeting space, every inch of him vibrated with a thrilling sensation of freshness. He took a deep, ecstatic breath and opened his eyes.

"Enough," said Dr. Mundson, switching off the Ray. "After three minutes of rejuvenation, you are commencing again with perfect cells. All ravages from disease and wear have been corrected."

Northwood leaped up joyously. His handsome eyes sparkled, his skin glowed. "I feel great! Never felt so good since I was a kid."

A pleased grin spread over the scientist's homely face. "See what my discovery will mean to the world! In the future we shall all go to the laboratory for recuperation and nourishment. We'll have almost twenty-four hours a day for work and play."

He stretched out on the bed contentedly. "Some day, when my work is nearly done, I shall permit the Life Ray to cure my hump."

"Why not now?"

Dr. Mundson sighed. "If I were perfect, I should cease to be so overwhelmingly conscious of the importance of perfection." He settled back to enjoyment of the Life Ray.

A few minutes later, he jumped up, alert as a boy. "*Ach!* That's fine. Now I'll show you how the Life Ray speeds up development and produces four generations of humans a year."

With restored energy, Northwood began thinking of Athalia. As he followed Dr. Mundson down a long corridor, he yearned to see her again, to be certain that she was safe. Once he imagined he felt a gentle, soft-fleshed touch against his hand, and was disappointed not to see her walking by his side. Was she with him, unseen? The thought was sweet.

Before Dr. Mundson opened the massive bronze door at the end of the corridor, he said:

"Don't be surprised or shocked over anything you see

here, John Northwood. This is the Baby Laboratory."

They entered a room which seemed no different from a hospital ward. On little white beds lay naked children of various sizes, perfect, solemn-eyed youngsters and older children as beautiful as animated statues. Above each bed was a small Life Ray projector. A white-capped nurse went from bed to bed.

"They are recuperating from the daily educational period," said the scientist. "After a few minutes of this they will go into the growing room, which I shall have to show you through a window. Should you and I enter, we might be changed in a most extraordinary manner." He laughed mischievously. "But, look, Northwood!"

He slid back a panel in the wall, and Northwood peered in through a thick pane of clear glass. The room was really an immense outdoor arena, its only carpet the fine-bladed grass, its roof the blue sky cut in the middle by an enormous disc from which shot the aurora of trapped sunshine which made a golden

umbrella over the valley. Through openings in the bottom of the disc poured a fine rain of rays which fell constantly upon groups of children, youths and young girls, all clad in the merest scraps of clothing. Some were dancing, others were playing games, but all seemed as supremely happy as the birds and butterflies which fluttered about the shrubs and flowers edging the arena.

"I don't expect you to believe," said Dr. Mundson, "that the oldest young man in there is three months old. You cannot see visible changes in a body which grows as slowly as the human being, whose normal period of development is twenty years or more. But I can give you visible proof of how fast growth takes place under the full power of the Life Ray. Plant life, which, even when left to nature, often develops from seed to flower within a few weeks or months, can be seen making its miraculous changes under the Life Ray. Watch those gorgeous purple flowers over which the butterflies are hovering."

Northwood followed his pointing finger. Near the glass window through which they looked grew an

enormous bank of resplendent violet colored flowers, which literally enshrouded the entire bush with their royal glory. At first glance it seemed as though a violent wind were snatching at flower and bush, but closer inspection proved that the agitation was part of the plant itself. And then he saw that the movements were the result of perpetual composition and growth.

He fastened his eyes on one huge bud. He saw it swell, burst, spread out its passionate purple velvet, lift the broad flower face to the light for a joyous minute. A few seconds later a butterfly lighted airily to sample its nectar and to brush the pollen from its yellow dusted wings. Scarcely had the winged visitor flown away than the purple petals began to wither and fall away, leaving the seed pod on the stem. The visible change went on in this seed pod. It turned rapidly brown, dried out, and then sent the released seeds in a shower to the rich black earth below.

Scarcely had the seeds touched the ground than they sent up tiny green shoots that grew larger each moment. Within ten minutes there was a new plant a foot high. Within half an hour, the plant budded,

blossomed, and cast forth its own seed.

"You understand?" asked the scientist. "Development is going on as rapidly among the children. Before the first year has passed, the youngest baby will have grandchildren; that is, if the baby tests out fit to pass its seed down to the new generation. I know it sounds absurd. Yet you saw the plant."

"But Doctor," Northwood rubbed his jaw thoughtfully, "Nature's forces of destruction, of tearing down, are as powerful as her creative powers. You have discovered the ultimate in creation and upbuilding. But perhaps—oh, Lord, it is too awful to think!"

"Speak, Northwood!" The scientist's voice was impatient.

"It is nothing!" The pale young man attempted a smile. "I was only imagining some of the horror that could be thrust on the world if a supermind like Adam's should discover Nature's secret of death and destruction and speed it up as you have sped the life force."

"*Ach Gott!*" Dr. Mundson's face was white. "He has his own laboratory, where he works every day. Don't talk so loud. He might be listening. And I believe he can do anything he sets out to accomplish."

Close to Northwood's ear fell a faint, triumphant whisper: "Yes, he can do anything. How did you guess, worm?"

It was Adam's voice.

"Now come and see the Leyden jar mothers," said Dr. Mundson. "We do not wait for the child to be born to start our work."

He took Northwood to a laboratory crowded with strange apparatus, where young men and women worked. Northwood knew instantly that these people, although unusually handsome and strong, were not of Adam's generation. None of them had the look of newness which marked those who had grown up under the Life Ray.

"They are the perfect couples whom I combed the

world to find," said the scientist. "From their eugenic marriages sprang the first children that passed through the laboratory. I had hoped," he hesitated and looked sideways at Northwood, "I had dreamed of having the children of you and Athalia to help strengthen the New Race."

A wave of sudden disgust passed over Northwood.

"Thanks," he said tartly. "When I marry Athalia, I intend to have an old-fashioned home and a Black Age family. I don't relish having my children turned into—experiments."

"But wait until you see all the wonders of the laboratory! That is why I am showing you all this."

Northwood drew his handkerchief and mopped his brow. "It sickens me, Doctor! The more I see, the more pity I have for Adam—and the less I blame him for his rebellion and his desire to kill and to rule. Heavens! What a terrible thing you have done, experimenting with human life."

"Nonsense! Can you say that all life—all matter—is not the result of scientific experiment? Can you?" His black gaze made Northwood uncomfortable. "Buck up, young friend, for now I am going to show you a marvelous improvement on Nature's bungling ways—the Leyden jar mother." He raised his voice and called, "Lilith!"

The woman whom they had met on the field came forward.

"May we take a peep at Lona's twins?" asked the scientist. "They are about ready to go to the growing dome, are they not?"

"In five more minutes," said the woman. "Come see."

She lifted one of the black velvet curtains that lined an entire side of the laboratory and thereby disclosed a globular jar of glass and metal, connected by wires to a dynamo. Above the jar was a Life Ray projector. Lilith slid aside a metal portion of the jar, disclosing through the glass underneath the squirming, kicking body of a baby, resting on a bed of soft, spongy

substance, to which it was connected by the navel cord.

"The Leyden jar mother," said Dr. Mundson. "It is the dream of us scientists realized. The human mother's body does nothing but nourish and protect her unborn child, a job which science can do better. And so, in New Eden, we take the young embryo and place it in the Leyden jar mother, where the Life Ray, electricity, and chemical food shortens the period of gestation to a few days."

At that moment a bell under the Leyden jar began to ring. Dr. Mundson uncovered the jar and lifted out the child, a beautiful, perfectly formed boy, who began to cry lustily.

"Here is one baby who'll never be kissed," he said.

"He'll be nourished chemically, and, at the end of the week, will no longer be a baby. If you are patient, you can actually see the processes of development taking place under the Life Ray, for babies develop very fast."

Northwood buried his face in his hands. "Lord! This is awful. No childhood; no mother to mould his mind! No parents to watch over him, to give him their tender care!"

"Awful, fiddlesticks! Come see how children get their education, how they learn to use their hands and feet so they need not pass through the awkwardness of childhood."

He led Northwood to a magnificent building whose façade of white marble was as simply beautiful as a Greek temple. The side walls, built almost entirely of glass, permitted the synthetic sunshine to sweep from end to end. They first entered a library, where youths and young girls poured over books of all kinds. Their manner of reading mystified Northwood. With a single sweep of the eye, they seemed to devour a page, and then turned to the next. He stepped closer to peer over the shoulder of a beautiful girl. She was reading "Euclid's Elements of Geometry," in Latin, and she turned the pages as swiftly as the other girl occupying her table, who was devouring "Paradise Lost."

Dr. Mundson whispered to him: "If you do not believe that Ruth here is getting her Euclid, which she probably never saw before to-day, examine her from the book; that is, if you are a good enough Latin scholar."

Ruth stopped her reading to talk to him, and, in a few minutes, had completely dumbfounded him with her pedantic replies, which fell from lips as luscious and unformed as an infant's.

"Now," said Dr. Mundson, "test Rachael on her Milton. As far as she has read, she should not misquote a line, and her comments will probably prove her scholarly appreciation of Milton."

Word for word, Rachael was able to give him "Paradise Lost" from memory, except the last four pages, which she had not read. Then, taking the book from him, she swept her eyes over these pages, returned the book to him, and quoted copiously and correctly.

Dr. Mundson gloated triumphantly over his

astonishment. "There, my friend. Could you now be satisfied with old-fashioned children who spend long, expensive years in getting an education? Of course, your children will not have the perfect brains of these, yet, developed under the Life Ray, they should have splendid mentality.

"These children, through selective breeding, have brains that make everlasting records instantly. A page in a book, once seen, is indelibly retained by them, and understood. The same is true of a lecture, of an explanation given by a teacher, of even idle conversation. Any man or woman in this room should be able to repeat the most trivial conversation days old."

"But what of the arts, Dr. Mundson? Surely even your supermen and women cannot instantly learn to paint a masterpiece or to guide their fingers and their brains through the intricacies of a difficult musical composition."

"No?" His dark eyes glowed. "Come see!"

Before they entered another wing of the building, they heard a violin being played masterfully.

Dr. Mundson paused at the door.

"So that you may understand what you shall see, let me remind you that the nerve impulses and the coordinating means in the human body are purely electrical. The world has not yet accepted my theory, but it will. Under superman's system of education, the instantaneous records made on the brain give immediate skill to the acting parts of the body. Accordingly, musicians are made over night."

He threw open the door. Under a Life Ray projector, a beautiful, Juno-esque woman was playing a violin. Facing her, and with eyes fastened to hers, stood a young man, whose arms and slender fingers mimicked every motion she made. Presently she stopped playing and handed the violin to him. In her own masterly manner, he repeated the score she had played.

"That is Eve," whispered Dr. Mundson. "I had selected her as Adam's wife. But he does not want her, the

most brilliant woman of the New Race."

Northwood gave the woman an appraising look. "Who wants a perfect woman? I don't blame Adam for preferring Athalia. But how is she teaching her pupil?"

"Through thought vibration, which these perfect people have developed until they can record permanently the radioactive waves of the brains of others."

Eve turned, caught Northwood's eyes in her magnetic blue gaze, and smiled as only a goddess can smile upon a mortal she has marked as her own. She came toward him with outflung hands.

"So you have come!" Her vibrant contralto voice, like Adam's, held the birdlike, broken tremulo of a young child's. "I have been waiting for you, John Northwood."

Her eyes, as blue and icy as Adam's, lingered long on him, until he flinched from their steely magnetism.

She slipped her arm through his and drew him gently but firmly from the room, while Dr. Mundson stood gaping after them.

They were on a flagged terrace arched with roses of gigantic size, which sent forth billows of sensuous fragrance. Eve led him to a white marble seat piled with silk cushions, on which she reclined her superb body, while she regarded him from narrowed lids.

"I saw your picture that he televisioned to Athalia," she said. "What a botch Dr. Mundson has made of his mating." Her laugh rippled like falling water. "I want you, John Northwood!"

Northwood started and blushed furiously. Smile dimples broke around her red, humid lips.

"Ah, you're old-fashioned!"

Her large, beautiful hand, fleshed more tenderly than any woman's hand he had ever seen, went out to him appealingly. "I can bring you amorous delight that your Athalia never could offer in her few years of

youth. And I'll never grow old, John Northwood."

She came closer until he could feel the fragrant warmth of her tawny, ribbon bound hair pulse against his face. In sudden panic he drew back.

"But I am pledged to Athalia!" tumbled from him. "It is all a dreadful mistake, Eve. You and Adam were created for each other."

"Hush!" The lightning that flashed from her blue eyes changed her from seductress to angry goddess.

"Created for each other! Who wants a made-to-measure lover?"

The luscious lips trembled slightly, and into the vivid eyes crept a suspicion of moisture. Eternal Eve's weapons! Northwood's handsome face relaxed with pity.

"I want you, John Northwood," she continued shamelessly. "Our love will be sublime." She leaned heavily against him, and her lips were like a blood red flower pressed against white satin. "Come, beloved,

kiss me!"

Northwood gasped and turned his head. "Don't, Eve!"

"But a kiss from me will set you apart from all your generation, John Northwood, and you shall understand what no man of the Black Age could possibly fathom."

Her hair had partly fallen from its ribbon bandage and poured its fragrant gold against his shoulder.

"For God's sake, don't tempt me!" he groaned. "What do you mean?"

"That mental and physical and spiritual contact with me will temporarily give you, a three-dimension creature, the power of the new sense, which your race will not have for fifty thousand years."

White-lipped and trembling, he demanded: "Explain!"

Eve smiled. "Have you not guessed that Adam has developed an additional sense? You've seen him

vanish. He and I have the sixth sense of Time Perception—the new sense which enables us to penetrate what you of the Black Age call the Fourth Dimension. Even you whose mentalities are framed by three dimensions have this sixth sense instinct. Your very religion is based on it, for you believe that in another life you shall step into Time, or, as you call it, eternity." She leaned closer so that her hair brushed his cheek. "What is eternity, John Northwood? Is it not keeping forever ahead of the Destroyer? The future is eternal, for it is never reached. Adam and I, through our new sense which comprehends Time and Space, can vanish by stepping a few seconds into the future, the Fourth Dimension of Space. Death can never reach us, not even accidental death, unless that which causes death could also slip into the future, which is not yet possible."

"But if the Fourth Dimension is future Time, why can one in the third dimension feel the touch of an unseen presence in the Fourth Dimension—hear his voice, even?"

"Thought vibration. The touch is not really felt nor the

voice heard: they are only imagined. The radioactive waves of the brain of even you Black Age people are swift enough to bridge Space and Time. And it is the mind that carries us beyond the third dimension."

Her red mouth reached closer to him, her blue eyes touched hidden forces that slept in remote cells of his being. "You are going into Eternal Time, John Northwood, Eternity without beginning or end. You understand? You feel it? Comprehend it? Now for the contact—kiss me!"

Northwood had seen Athalia vanish under Adam's kiss. Suddenly, in one mad burst of understanding, he leaned over to his magnificent temptress.

For a split second he felt the sweet pressure of baby-soft lips, and then the atoms of his body seemed to fly asunder. Black chaos held him for a frightful moment before he felt sanity return.

He was back on the terrace again, with Eve by his side. They were standing now. The world about him looked the same, yet there was a subtle change in

everything.

Eve laughed softly. "It is puzzling, isn't it? You're seeing everything as in a mirror. What was left before is now right. Only you and I are real. All else is but a vision, a dream. For now you and I are existing one minute in future time, or, more simply, we are in the Fourth Dimension. To everything in the third dimension, we are invisible. Let me show you that Dr. Mundson cannot see you."

They went back to the room beyond the terrace. Dr. Mundson was not present.

"There he goes down the jungle path," said Eve, looking out a window. She laughed. "Poor old fellow. The children of his genius are worrying him."

They were standing in the recess formed by a bay window. Eve picked up his hand and laid it against her face, giving him the full, blasting glory of her smiling blue eyes.

Northwood, looking away miserably, uttered a low cry.

Coming over the field beyond were Adam and Athalia. By the trimming on the blue dress she wore, he could see that she was still in the Fourth Dimension, for he did not see her as a mirror image.

A look of fear leaped to Eve's face. She clutched Northwood's arm, trembling.

"I don't want Adam to see that I have passed you beyond," she gasped. "We are existing but one minute in the future. Always Adam and I have feared to pass too far beyond the sweetness of reality. But now, so that Adam may not see us, we shall step five minutes into what-is-yet-to-be. And even he, with all his power, cannot see into a future that is more distant than that in which he exists."

She raised her humid lips to his. "Come, beloved."

Northwood kissed her. Again came the moment of confusion, of the awful vacancy that was like death, and then he found himself and Eve in the laboratory, following Adam and Athalia down a long corridor. Athalia was crying and pleading frantically with

Adam. Once she stopped and threw herself at his feet in a gesture of dramatic supplication, arms outflung, streaming eyes wide open with fear.

Adam stooped and lifted her gently and continued on his way, supporting her against his side.

Eve dug her fingers into Northwood's arm. Horror contorted her face, horror mixed with rage.

"My mind hears what he is saying, understands the vile plan he has made, John Northwood. He is on his way to his laboratory to destroy not only you and most of these in New Eden, but me as well. He wants only Athalia."

Striding forward like an avenging goddess, she pulled Northwood after her.

"Hurry!" she whispered. "Remember, you and I are five minutes in the future, and Adam is only one. We are witnessing what will occur four minutes from now. We yet have time to reach the laboratory before him and be ready for him when he enters. And because he

will have to go back to Present Time to do his work of destruction, I will be able to destroy him. Ah!"

Fierce joy burned in her flashing blue eyes, and her slender nostrils quivered delicately. Northwood, peeping at her in horror, knew that no mercy could be expected of her. And when she stopped at a certain door and inserted a key, he remembered Athalia. What if she should enter with Adam in Present Time?

They were inside Adam's laboratory, a huge apartment filled with queer apparatus and cages of live animals. The room was a strange paradox. Part of the equipment, the walls, and the floor was glistening with newness, and part was moulding with extreme age. The powers of disintegration that haunt a tropical forest seemed to be devouring certain spots of the room. Here, in the midst of bright marble, was a section of wall that seemed as old as the pyramids. The surface of the stone had an appalling mouldiness, as though it had been lifted from an ancient graveyard where it had lain in the festering ground for unwholesome centuries.

Between cracks in this stained and decayed section of stone grew fetid moss that quivered with the microscopic organisms that infest age-rotten places. Sections of the flooring and woodwork also reeked with mustiness. In one dark, webby corner of the room lay a pile of bleached bones, still tinted with the ghastly grays and pinks of putrefaction. Northwood, overwhelmingly nauseated, withdrew his eyes from the bones, only to see, in another corner, a pile of worm-eaten clothing that lay on the floor in the outline of a man.

Faint with the reek of ancient mustiness, Northwood retreated to the door, dizzy and staggering.

"It sickens you," said Eve, "and it sickens me also, for death and decay are not pleasant. Yet Nature, left to herself, reduces all to this. Every grave that has yawned to receive its prey hides corruption no less shocking. Nature's forces of creation and destruction forever work in partnership. Never satisfied with her composition, she destroys and starts again, building, building towards the ultimate of perfection. Thus, it is natural that if Dr. Mundson isolated the Life Ray,

Nature's supreme force of compensation, isolation of the Death Ray should closely follow. Adam, thirsting for power, has succeeded. A few sweeps of his unholy ray of decomposition will undo all Dr. Mundson's work in this valley and reduce it to a stinking holocaust of destruction. And the time for his striking has come!"

She seized his face and drew it toward her. "Quick!" she said. "We'll have to go back to the third dimension. I could leave you safe in the fourth, but if anything should happen to me, you would be stranded forever in future time."

She kissed his lips. In a moment, he was back in the old familiar world, where right is right and left is left. Again the subtle change wrought by Eve's magic lips had taken place.

Eve went to a machine standing in a corner of the room.

"Come here and get behind me, John Northwood. I want to test it before he enters."

Northwood stood behind her shoulder.

"Now watch!" she ordered. "I shall turn it on one of those cages of guinea pigs over there."

She swung the projector around, pointed it at the cage of small, squealing animals, and threw a lever. Instantly a cone of black mephitis shot forth, a loathsome, bituminous stream of putrefaction that reeked of the grave and the cesspool, of the utmost reaches of decay before the dust accepts the disintegrated atoms. The first touch of seething, pitchy destruction brought screams of sudden agony from the guinea pigs, but the screams were cut short as the little animals fell in shocking, instant decay. The very cage which imprisoned them shriveled and retreated from the hellish, devouring breath that struck its noisome rot into the heart of the wood and the metal, reducing both to revolting ruin.

Eve cut off the frightful power, and the black cone disappeared, leaving the room putrid with its defilement.

"And Adam would do that to the world," she said, her blue eyes like electric-shot icicles. "He would do it to you, John Northwood—and to me!" Her full bosom strained under the passion beneath.

"Listen!" She raised her hand warningly. "He comes! The destroyer comes!"

A hand was at the door. Eve reached for the lever, and, the same moment, Northwood leaned over her imploringly.

"If Athalia is with him!" he gasped. "You will not harm her?"

A wild shriek at the door, a slight scuffle, and then the doorknob was wrenched as though two were fighting over it.

"For God's sake, Eve!" implored Northwood. "Wait! Wait!"

"No! She shall die, too. You love her!"

Icy, cruel eyes cut into him, and a new-fleshed hand tried to push him aside. The door was straining open. A beloved voice shrieked. "John!"

Eve and Northwood both leaped for the lever. Under her tender white flesh she was as strong as a man. In the midst of the struggle, her red, humid lips approached his—closer. Closer. Their merest pressure would thrust him into Future Time, where the laboratory and all it contained would be but a shadow, and where he would be helpless to interfere with her terrible will.

He saw the door open and Adam stride into the room. Behind him, lying prone in the hall where she had probably fainted, was Athalia.

IMAGEDESCRIPTION

In a mad burst of strength he touched the lever together with Eve.

The projector, belching forth its stinking breath of corruption swung in a mad arc over the ceiling, over the walls—and then straight at Adam.

IMAGEDESCRIPTION

Then, quicker than thought, came the accident. Eve, attempting to throw Northwood off, tripped, fell half over the machine, and, with a short scream of despair, dropped into the black path of destruction.

Northwood paused, horrified. The Death Ray was pointed at an inner wall of the room, which, even as he looked, crumbled and disappeared, bringing down upon him dust more foul than any obscenity the bowels of the earth might yield. In an instant the black cone ate through the outer parts of the building, where crashing stone and screams that were more horrible because of their shortness followed the ruin that swept far into the fair reaches of the valley.

The paralyzing odor of decay took his breath, numbed his muscles, until, of all that huge building, the wall behind him and one small section of the room by the doorway alone remained whole. He was trying to nerve himself to reach for the lever close to that quiet formless thing still partly draped over the machine, when a faint sound in the door electrified him. At first, he dared not look, but his own name, spoken almost in a gasp, gave him courage.

Athalia lay on the floor, apparently untouched.

He jerked the lever violently before running to her, exultant with the knowledge that his own efforts to

keep the ray from the door had saved her.

"And you're not hurt!" He gathered her close.

"John! I saw it get Adam." She pointed to a new mound of mouldy clothes on the floor. "Oh, it is hideous for me to be so glad, but he was going to destroy everything and everyone except me. He made the ray projector for that one purpose."

Northwood looked over the pile of putrid ruins which a few minutes ago had been a building. There was not a wall left intact.

"His intention is accomplished, Athalia," he said sadly. "Let's get out before more stones fall."

In a moment they were in the open. An ominous stillness seemed to grip the very air—the awful silence of the polar wastes which lay not far beyond the mountains.

"How dark it is, John!" cried Athalia. "Dark and cold!"

"The sunshine projector!" gasped Northwood. "It must have been destroyed. Look, dearest! The golden light has disappeared."

"And the warm air of the valley will lift immediately. That means a polar blizzard." She shuddered and clung closer to him. "I've seen Antarctic storms, John. They're death."

Northwood avoided her eyes. "There's the sun-ship. We'll give the ruins the once over in case there are any survivors; then we'll save ourselves."

Even a cursory examination of the mouldy piles of stone and dust convinced them that there could be no survivors. The ruins looked as though they had lain in those crumbling piles for centuries. Northwood, smothering his repugnance, stepped among them—among the green, slimy stones and the unspeakable revolting débris, staggering back and faint and shocked when he came upon dust that was once human.

"God!" he groaned, hands over eyes. "We're alone,

Athalia! Alone in a charnal house. The laboratory housed the entire population, didn't it?"

"Yes. Needing no sleep nor food, we did not need houses. We all worked here, under Dr. Mundson's generalship, and, lately under Adam's, like a little band of soldiers fighting for a great cause."

"Let's go to the sun-ship, dearest."

"But Daddy Mundson was in the library," sobbed Athalia. "Let's look for him a little longer."

Sudden remembrance came to Northwood. "No, Athalia! He left the library. I saw him go down the jungle path several minutes before I and Eve went to Adam's laboratory."

"Then he might be safe!" Her eyes danced. "He might have gone to the sun-ship."

Shivering, she slumped against him. "Oh, John! I'm cold."

Her face was blue. Northwood jerked off his coat and wrapped it around her, taking the intense cold against his unprotected shoulders. The low, gray sky was rapidly darkening, and the feeble light of the sun could scarcely pierce the clouds. It was disturbing to know that even the summer temperature in the Antarctic was far below zero.

"Come, girl," said Northwood gravely. "Hurry! It's snowing."

They started to run down the road through the narrow strip of jungle. The Death Ray had cut huge swathes in the tangle of trees and vines, and now areas of heaped débris, livid with the colors of recent decay, exhaled a mephitic humidity altogether alien to the snow that fell in soft, slow flakes. Each hesitated to voice the new fear: had the sun-ship been destroyed?

By the time they reached the open field, the snow stung their flesh like sharp needles, but it was not yet thick enough to hide from them a hideous fact.

The sun-ship was gone.

It might have occupied one of several black, foul areas on the green grass, where the searching Death Ray had made the very soil putrefy, and the rocks crumble into shocking dust.

Northwood snatched Athalia to him, too full of despair to speak. A sudden terrific flurry of snow whirled around them, and they were almost blown from their feet by the icy wind that tore over the unprotected field.

"It won't be long," said Athalia faintly. "Freezing doesn't hurt, John, dear."

"It isn't fair, Athalia! There never would have been such a marriage as ours. Dr. Mundson searched the world to bring us together."

"For scientific experiment!" she sobbed. "I'd rather die, John. I want an old-fashioned home, a Black Age family. I want to grow old with you and leave the earth to my children. Or else I want to die here now

under the kind, white blanket the snow is already spreading over us." She drooped in his arms.

Clinging together, they stood in the howling wind, looking at each other hungrily, as though they would snatch from death this one last picture of the other.

Northwood's freezing lips translated some of the futile words that crowded against them. "I love you because you are not perfect. I hate perfection!"

"Yes. Perfection is the only hopeless state, John. That is why Adam wanted to destroy, so that he might build again."

They were sitting in the snow now, for they were very tired. The storm began whistling louder, as though it were only a few feet above their heads.

"That sounds almost like the sun-ship," said Athalia drowsily.

"It's only the wind. Hold your face down so it won't strike your flesh so cruelly."

"I'm not suffering. I'm getting warm again." She smiled at him sleepily.

Little icicles began to form on their clothing, and the powdery snow frosted their uncovered hair.

Suddenly came a familiar voice: "*Ach Gott!*"

Dr. Mundson stood before them, covered with snow until he looked like a polar bear.

"Get up!" he shouted. "Quick! To the sun-ship!"

He seized Athalia and jerked her to her feet. She looked at him sleepily for a moment, and then threw herself at him and hugged him frantically.

"You're not dead?"

Taking each by the arm, he half dragged them to the sun-ship, which had landed only a few feet away. In a few minutes he had hot brandy for them.

While they sipped greedily, he talked, between

working the sun-ship's controls.

"No, I wouldn't say it was a lucky moment that drew me to the sun-ship. When I saw Eve trying to charm John, I had what you American slangists call a hunch, which sent me to the sun-ship to get it off the ground so that Adam couldn't commandeer it. And what is a hunch but a mental penetration into the Fourth Dimension?" For a long moment, he brooded, absent-minded. "I was in the air when the black ray, which I suppose is Adam's deviltry, began to destroy everything it touched. From a safe elevation I saw it wreck all my work." A sudden spasm crossed his face. "I've flown over the entire valley. We're the only survivors—thank God!"

"And so at last you confess that it is not well to tamper with human life?" Northwood, warmed with hot brandy, was his old self again.

"Oh, I have not altogether wasted my efforts. I went to elaborate pains to bring together a perfect man and a perfect woman of what Adam called our Black Age." He smiled at them whimsically.

"And who can say to what extent you have thus furthered natural evolution?" Northwood slipped his arm around Athalia. "Our children might be more than geniuses, Doctor!"

Dr. Mundson nodded his huge, shaggy head gravely.

"The true instinct of a Creature of the Light," he declared.

#12 Into Space, by Sterner St. Paul Meek:

What was the extraordinary connection between Dr. Livermore's sudden disappearance and the coming of a new satellite to the Earth?

Aproximate word count: 4,600

Bigotry:

Warnings:

- - -

Many of my readers will remember the mysterious radio messages which were heard by both amateur and professional short wave operators during the nights of the twenty-third and twenty-fourth of last September, and even more will remember the astounding discovery made by Professor Montescue of the Lick Observatory on the night of September twenty-fifth. At the time, some inspired writers tried to connect the two events, maintaining that the discovery of the fact that the earth had a new satellite

coincident with the receipt of the mysterious messages was evidence that the new planetoid was inhabited and that the messages were attempts on the part of the inhabitants to communicate with us.

The fact that the messages were on a lower wave length than any receiver then in existence could receive with any degree of clarity, and the additional fact that they appeared to come from an immense distance lent a certain air of plausibility to these ebullitions in the Sunday magazine sections. For some weeks the feature writers harped on the subject, but the hurried construction of new receivers which would work on a lower wave length yielded no results, and the solemn pronouncements of astronomers to the effect that the new celestial body could by no possibility have an atmosphere on account of its small size finally put an end to the talk. So the matter lapsed into oblivion.

While quite a few people will remember the two events I have noted, I doubt whether there are five hundred people alive who will remember anything at all about the disappearance of Dr. Livermore of the

University of Calvada on September twenty-third. He was a man of some local prominence, but he had no more than a local fame, and few papers outside of California even noted the event in their columns. I do not think that anyone ever tried to connect up his disappearance with the radio messages or the discovery of the new earthly satellite; yet the three events were closely bound up together, and but for the Doctor's disappearance, the other two would never have happened.

Dr. Livermore taught physics at Calvada, or at least he taught the subject when he remembered that he had a class and felt like teaching. His students never knew whether he would appear at class or not; but he always passed everyone who took his courses and so, of course, they were always crowded. The University authorities used to remonstrate with him, but his ability as a research worker was so well known and recognized that he was allowed to go about as he pleased. He was a bachelor who lived alone and who had no interests in life, so far as anyone knew, other than his work.

I first made contact with him when I was a freshman at Calvada, and for some unknown reason he took a liking to me. My father had insisted that I follow in his footsteps as an electrical engineer; as he was paying my bills, I had to make a show at studying engineering while I clandestinely pursued my hobby, literature. Dr. Livermore's courses were the easiest in the school and they counted as science, so I regularly registered for them, cut them, and attended a class in literature as an auditor. The Doctor used to meet me on the campus and laughingly scold me for my absence, but he was really in sympathy with my ambition and he regularly gave me a passing mark and my units of credit without regard to my attendance, or, rather, lack of it.

When I graduated from Calvada I was theoretically an electrical engineer. Practically I had a pretty good knowledge of contemporary literature and knew almost nothing about my so-called profession. I stalled around Dad's office for a few months until I landed a job as a cub reporter on the San Francisco *Graphic* and then I quit him cold. When the storm

blew over, Dad admitted that you couldn't make a silk purse out of a sow's ear and agreed with a grunt to my new line of work. He said that I would probably be a better reporter than an engineer because I couldn't by any possibility be a worse one, and let it go at that. However, all this has nothing to do with the story. It just explains how I came to be acquainted with Dr. Livermore, in the first place, and why he sent for me on September twenty-second, in the second place.

The morning of the twenty-second the City Editor called me in and asked me if I knew "Old Liverpills."

"He says that he has a good story ready to break but he won't talk to anyone but you," went on Barnes. "I offered to send out a good man, for when Old Liverpills starts a story it ought to be good, but all I got was a high powered bawling out. He said that he would talk to you or no one and would just as soon talk to no one as to me any longer. Then he hung up. You'd better take a run out to Calvada and see what he has to say. I can have a good man rewrite your drivel when you get back."

I was more or less used to that sort of talk from Barnes so I paid no attention to it. I drove my flivver down to Calvada and asked for the Doctor.

"Dr. Livermore?" said the bursar. "Why, he hasn't been around here for the last ten months. This is his sabbatical year and he is spending it on a ranch he owns up at Hat Creek, near Mount Lassen. You'll have to go there if you want to see him."

I knew better than to report back to Barnes without the story, so there was nothing to it but to drive up to Hat Creek, and a long, hard drive it was. I made Redding late that night; the next day I drove on to Burney and asked for directions to the Doctor's ranch.

"So you're going up to Doc Livermore's, are you?" asked the Postmaster, my informant. "Have you got an invitation?"

I assured him that I had.

"It's a good thing," he replied, "because he don't allow anyone on his place without one. I'd like to go up

there myself and see what's going on, but I don't want to get shot at like old Pete Johnson did when he tried to drop in on the Doc and pay him a little call. There's something mighty funny going on up there."

Naturally I tried to find out what was going on but evidently the Postmaster, who was also the express agent, didn't know. All he could tell me was that a "lot of junk" had come for the Doctor by express and that a lot more had been hauled in by truck from Redding.

"What kind of junk?" I asked him.

"Almost everything, Bub: sheet steel, machinery, batteries, cases of glass, and Lord knows what all. It's been going on ever since he landed there. He has a bunch of Indians working for him and he don't let a white man on the place."

Forced to be satisfied with this meager information, I started old Lizzie and lit out for the ranch. After I had turned off the main trail I met no one until the ranch house was in sight. As I rounded a bend in the road which brought me in sight of the building, I was

forced to put on my brakes at top speed to avoid running into a chain which was stretched across the road. An Indian armed with a Winchester rifle stood behind it, and when I stopped he came up and asked my business.

"My business is with Dr. Livermore," I said tartly.

"You got letter?" he inquired.

"No," I answered.

"No ketchum letter, no ketchum Doctor," he replied, and walked stolidly back to his post.

"This is absurd," I shouted, and drove Lizzie up to the chain. I saw that it was merely hooked to a ring at the end, and I climbed out and started to take it down. A thirty-thirty bullet embedded itself in the post an inch or two from my head, and I changed my mind about taking down that chain.

"No ketchum letter, no ketchum Doctor," said the Indian laconically as he pumped another shell into his

gun.

I was balked, until I noticed a pair of telephone wires running from the house to the tree to which one end of the chain was fastened.

"Is that a telephone to the house?" I demanded.

The Indian grunted an assent.

"Dr. Livermore telephoned me to come and see him," I said. "Can't I call him up and see if he still wants to see me?"

The Indian debated the question with himself for a minute and then nodded a doubtful assent. I cranked the old coffee mill type of telephone which I found, and presently heard the voice of Dr. Livermore.

"This is Tom Faber, Doctor," I said. "The *Graphic* sent me up to get a story from you, but there's an Indian here who started to murder me when I tried to get past your barricade."

"Good for him," chuckled the Doctor. "I heard the shot, but didn't know that he was shooting at you. Tell him to talk to me."

The Indian took the telephone at my bidding and listened for a minute.

"You go in," he agreed when he hung up the receiver.

He took down the chain and I drove on up to the house, to find the Doctor waiting for me on the veranda.

"Hello, Tom," he greeted me heartily. "So you had trouble with my guard, did you?"

"I nearly got murdered," I said ruefully.

"I expect that Joe would have drilled you if you had tried to force your way in," he remarked cheerfully. "I forgot to tell him that you were coming to-day. I told him you would be here yesterday, but yesterday isn't to-day to that Indian. I wasn't sure you would get here at all, in point of fact, for I didn't know whether that

old fool I talked to in your office would send you or some one else. If anyone else had been sent, he would have never got by Joe, I can tell you. Come in. Where's your bag?"

"I haven't one," I replied. "I went to Calvada yesterday to see you, and didn't know until I got there that you were up here."

The Doctor chuckled.

"I guess I forgot to tell where I was," he said. "That man I talked to got me so mad that I hung up on him before I told him. It doesn't matter, though. I can dig you up a new toothbrush, and I guess you can make out with that. Come in."

I followed him into the house, and he showed me a room fitted with a crude bunk, a washstand, a bowl and a pitcher.

"You won't have many luxuries here, Tom," he said, "but you won't need to stay here for more than a few days. My work is done: I am ready to start. In fact, I

would have started yesterday instead of to-day, had you arrived. Now don't ask any questions; it's nearly lunch time."

"What's the story, Doctor?" I asked after lunch as I puffed one of his excellent cigars. "And why did you pick me to tell it to?"

"For several reasons," he replied, ignoring my first question. "In the first place, I like you and I think that you can keep your mouth shut until you are told to open it. In the second place, I have always found that you had the gift of vision or imagination and have the ability to believe. In the third place, you are the only man I know who had the literary ability to write up a good story and at the same time has the scientific background to grasp what it is all about. Understand that unless I have your promise not to write this story until I tell you that you can, not a word will I tell you."

I reflected for a moment. The *Graphic* would expect the story when I got back, but on the other hand I knew that unless I gave the desired promise, the Doctor wouldn't talk.

"All right," I assented, "I'll promise."

"Good!" he replied. "In that case, I'll tell you all about it. No doubt you, like the rest of the world, think that I'm crazy?"

"Why, not at all," I stammered. In point of fact, I had often harbored such a suspicion.

"Oh, that's all right," he went on cheerfully. "I *am* crazy, crazy as a loon, which, by the way, is a highly sensible bird with a well balanced mentality. There is no doubt that I am crazy, but my craziness is not of the usual type. Mine is the insanity of genius."

He looked at me sharply as he spoke, but long sessions at poker in the San Francisco Press Club had taught me how to control my facial muscles, and I never batted an eye. He seemed satisfied, and went on.

"From your college work you are familiar with the laws of magnetism," he said. "Perhaps, considering just what your college career really was, I might

better say that you are supposed to be familiar with them."

I joined with him in his laughter.

"It won't require a very deep knowledge to follow the thread of my argument," he went on. "You know, of course, that the force of magnetic attraction is inversely proportional to the square of the distances separating the magnet and the attracted particles, and also that each magnetized particle had two poles, a positive and a negative pole, or a north pole and a south pole, as they are usually called?"

I nodded.

"Consider for a moment that the laws of magnetism, insofar as concerns the relation between distance and power of attraction, are exactly matched by the laws of gravitation."

"But there the similarity between the two forces ends," I interrupted.

"But there the similarity does *not* end," he said sharply. "That is the crux of the discovery which I have made: that magnetism and gravity are one and the same, or, rather, that the two are separate, but similar manifestations of one force. The parallel between the two grows closer with each succeeding experiment. You know, for example, that each magnetized particle has two poles. Similarly each gravitized particle, to coin a new word, had two poles, one positive and one negative. Every particle on the earth is so oriented that the negative poles point toward the positive center of the earth. This is what causes the commonly known phenomena of gravity or weight."

"I can prove the fallacy of that in a moment," I retorted.

"There are none so blind as those who will not see," he quoted with an icy smile. "I can probably predict your puerile argument, but go ahead and present it."

"If two magnets are placed so that the north pole of one is in juxtaposition to the south pole of the other,

they attract one another," I said. "If the position of the magnets be reversed so that the two similar poles are opposite, they will repel. If your theory were correct, a man standing on his head would fall off the earth."

"Exactly what I expected," he replied. "Now let me ask you a question. Have you ever seen a small bar magnet placed within the field of attraction of a large electromagnet? Of course you have, and you have noticed that, when the north pole of the bar magnet was pointed toward the electromagnet, the bar was attracted. However, when the bar was reversed and the south pole pointed toward the electromagnet, the bar was still attracted. You doubtless remember that experiment."

"But in that case the magnetism of the electromagnet was so large that the polarity of the small magnet was reversed!" I cried.

"Exactly, and the field of gravity of the earth is so great compared to the gravity of a man that when he stands on his head, his polarity is instantly reversed."

I nodded. His explanation was too logical for me to pick a flaw in it.

"If that same bar magnet were held in the field of the electromagnet with its north pole pointed toward the magnet and then, by the action of some outside force of sufficient power, its polarity were reversed, the bar would be repelled. If the magnetism were neutralized and held exactly neutral, it would be neither repelled nor attracted, but would act only as the force of gravity impelled it. Is that clear?"

"Perfectly," I assented.

"That, then, paves the way for what I have to tell you. I have developed an electrical method of neutralizing the gravity of a body while it is within the field of the earth, and also, by a slight extension, a method of entirely reversing its polarity."

I nodded calmly.

"Do you realize what this means?" he cried.

"No," I replied, puzzled by his great excitement.

"Man alive," he cried, "it means that the problem of aerial flight is entirely revolutionized, and that the era of interplanetary travel is at hand! Suppose that I construct an airship and then render it neutral to gravity. It would weigh nothing, *absolutely nothing*! The tiniest propeller would drive it at almost incalculable speed with a minimum consumption of power, for the only resistance to its motion would be the resistance of the air. If I were to reverse the polarity, it would be repelled from the earth with the same force with which it is now attracted, and it would rise with the same acceleration as a body falls toward the earth. It would travel to the moon in two hours and forty minutes."

"Air resistance would—"

"There is no air a few miles from the earth. Of course, I do not mean that such a craft would take off from the earth and land on the moon three hours later. There are two things which would interfere with that. One is the fact that the propelling force, the gravity of

the earth, would diminish as the square of the distance from the center of the earth, and the other is that when the band of neutral attraction, or rather repulsion, between the earth and the moon had been reached, it would be necessary to decelerate so as to avoid a smash on landing. I have been over the whole thing and I find that it would take twenty-nine hours and fifty-two minutes to make the whole trip. The entire thing is perfectly possible. In fact, I have asked you here to witness and report the first interplanetary trip to be made."

"Have you constructed such a device?" I cried.

"My space ship is finished and ready for your inspection," he replied. "If you will come with me, I will show it to you."

Hardly knowing what to believe, I followed him from the house and to a huge barnlike structure, over a hundred feet high, which stood nearby. He opened the door and switched on a light, and there before me stood what looked at first glance to be a huge artillery shell, but of a size larger than any ever made. It was

constructed of sheet steel, and while the lower part was solid, the upper sections had huge glass windows set in them. On the point was a mushroom shaped protuberance. It measured perhaps fifty feet in diameter and was one hundred and forty feet high, the Doctor informed me. A ladder led from the floor to a door about fifty feet from the ground.

I followed the Doctor up the ladder and into the space flier. The door led us into a comfortable living room through a double door arrangement.

"The whole hull beneath us," explained the Doctor, "is filled with batteries and machinery except for a space in the center, where a shaft leads to a glass window in the bottom so that I can see behind me, so to speak. The space above is filled with storerooms and the air purifying apparatus. On this level is my bedroom, kitchen, and other living rooms, together with a laboratory and an observatory. There is a central control room located on an upper level, but it need seldom be entered, for the craft can be controlled by a system of relays from this room or from any other room in the ship. I suppose that you are more or less

familiar with imaginative stories of interplanetary travel?"

I nodded an assent.

"In that case there is no use in going over the details of the air purifying and such matters," he said. "The story writers have worked out all that sort of thing in great detail, and there is nothing novel in my arrangements. I carry food and water for six months and air enough for two months by constant renovating. Have you any question you wish to ask?"

"One objection I have seen frequently raised to the idea of interplanetary travel is that the human body could not stand the rapid acceleration which would be necessary to attain speed enough to ever get anywhere. How do you overcome this?"

"My dear boy, who knows what the human body can stand? When the locomotive was first invented learned scientists predicted that the limit of speed was thirty miles an hour, as the human body could not stand a higher speed. To-day the human body stands a

speed of three hundred and sixty miles an hour without ill effects. At any rate, on my first trip I intend to take no chances. We know that the body can stand an acceleration of thirty-two feet per second without trouble. That is the rate of acceleration due to gravity and is the rate at which a body increases speed when it falls. This is the acceleration which I will use.

"Remember that the space traveled by a falling body in a vacuum is equal to one half the acceleration multiplied by the square of the elapsed time. The moon, to which I intend to make my first trip, is only 280,000 miles, or 1,478,400,000 feet, from us. With an acceleration of thirty-two feet per second, I would pass the moon two hours and forty minutes after leaving the earth. If I later take another trip, say to Mars, I will have to find a means of increasing my acceleration, possibly by the use of the rocket principle. Then will be time enough to worry about what my body will stand."

A short calculation verified the figures the Doctor had given me, and I stood convinced.

"Are you really going?" I asked.

"Most decidedly. To repeat, I would have started yesterday, had you arrived. As it is, I am ready to start at once. We will go back to the house for a few minutes while I show you the location of an excellent telescope through which you may watch my progress, and instruct you in the use of an ultra-short-wave receiver which I am confident will pierce the Heaviside layer. With this I will keep in communication with you, although I have made no arrangements for you to send messages to me on this trip. I intend to go to the moon and land. I will take atmosphere samples through an air port and, if there is an atmosphere which will support life, I will step out on the surface. If there is not, I will return to the earth."

A few minutes was enough for me to grasp the simple manipulations which I would have to perform, and I followed him again to the space flier.

"How are you going to get it out?" I asked.

"Watch," he said.

He worked some levers and the roof of the barn folded back, leaving the way clear for the departure of the huge projectile. I followed him inside and he climbed the ladder.

"When I shut the door, go back to the house and test the radio," he directed.

The door clanged shut and I hastened into the house. His voice came plainly enough. I went back to the flier and waved him a final farewell, which he acknowledged through a window; then I returned to the receiver. A loud hum filled the air, and suddenly the projectile rose and flew out through the open roof, gaining speed rapidly until it was a mere speck in the sky.

IMAGEDescription

It vanished. I had no trouble in picking him up with the telescope. In fact, I could see the Doctor through one of the windows.

"I have passed beyond the range of the atmosphere, Tom," came his voice over the receiver, "and I find that everything is going exactly as it should. I feel no

discomfort, and my only regret is that I did not install a transmitter in the house so that you could talk to me; but there is no real necessity for it. I am going to make some observations now, but I will call you again with a report of progress in half-an-hour."

For the rest of the afternoon and all of that night I received his messages regularly, but with the coming of daylight they began to fade. By nine o'clock I could get only a word here and there. By noon I could hear nothing. I went to sleep hoping that the night would bring better reception, nor was I disappointed. About eight o'clock I received a message, rather faintly, but none the less distinctly.

"I regret more than ever that I did not install a transmitter so that I could learn from you whether you are receiving my messages," his voice said faintly. "I have no idea of whether you can hear me or not, but I will keep on repeating this message every hour while my battery holds out. It is now thirty hours since I left the earth and I should be on the moon, according to my calculations. But I am not, and never will be. I am caught at the neutral point where the

gravity of the earth and the moon are exactly equal.

"I had relied on my momentum to carry me over this point. Once over it, I expected to reverse my polarity and fall on the moon. My momentum did not do so. If I keep my polarity as it was when left the earth, both the earth and the moon repel me. If I reverse it, they both attract me, and again I cannot move. If I had equipped my space flier with a rocket so that I could move a few miles, or even a few feet, from the dead line, I could proceed, but I did not do so, and I cannot move forward or back. Apparently I am doomed to stay here until my air gives out. Then my body, entombed in my space ship, will endlessly circle the earth as a satellite until the end of time. There is no hope for me, for long before a duplicate of my device equipped with rockets could be constructed and come to my rescue, my air would be exhausted. Good-by, Tom. You may write your story as soon as you wish. I will repeat my message in one hour. Good-by!"

At nine and at ten o'clock the message was repeated. At eleven it started again but after a few sentences the sound suddenly ceased and the receiver went

dead. I thought that the fault was with the receiver and I toiled feverishly the rest of the night, but without result. I learned later that the messages heard all over the world ceased at the same hour.

The next morning Professor Montescue announced his discovery of the world's new satellite.

#13 Mad Music, by Anthony Pelcher:

The sixty stories of the perfectly constructed colossus building had mysteriously crashed! What was the connection between this catastrophe and the weird strains of the mad musician's violin?

Aproximate word count: 6,100

Bigotry:

Warnings:

- - -

To the accompaniment of a crashing roar, not unlike rumbling thunder, the proud Colossus Building, which a few minutes before had reared its sixty stories of artistic architecture towards the blue dome of the sky, crashed in a rugged, dusty heap of stone, brick, cement and mortar. The steel framework, like the skeleton of some prehistoric monster, still reared to dizzy heights but in a bent and twisted shape of grotesque outline.

The sixty stories of the perfectly constructed Colossus building had mysteriously crashed! What was the connection between this catastrophe and the weird strains of the Mad Musician's violin?

No one knew how many lives were snuffed out in the avalanche.

As the collapse occurred in the early dawn it was not believed the death list would be large. It was admitted, however, that autos, cabs and surface cars may have been caught under the falling rock. One train was known to have been wrecked in the subway due to a cave-in from the surface under the ragged mountain of debris.

The litter fairly filled a part of Times Square, the most congested cross-roads on God's footstool. Straggling brick and rock had rolled across the street to the west and had crashed into windows and doors of innocent small tradesmen's shops.

A few minutes after the crash a mad crowd of people had piled from subway exits as far away as Penn

Station and Columbus Circle and from cross streets. These milled about, gesticulating and shouting hysterically. All neighboring police stations were hard put to handle the growing mob.

Hundreds of dead and maimed were being carried to the surface from the wrecked train in the subway. Trucks and cabs joined the ambulance crews in the work of transporting these to morgues and hospitals. As the morning grew older and the news of the disaster spread, more milling thousands tried to crowd into the square. Many were craning necks hopelessly on the outskirts of the throng, blocks away, trying vainly to get a view of what lay beyond.

The fire department and finally several companies of militia joined the police in handling the crowd. Newsies, never asleep, yowled their "Wuxtras" and made much small money.

The newspapers devoted solid pages in attempting to describe what had happened. Nervously, efficient reporters had written and written, using all their best adjectives and inventing new ones in attempts to

picture the crash and the hysterics which followed.

When the excitement was at its height a middle-aged man, bleeding at the head, clothes torn and dusty, staggered into the West 47th street police station. He found a lone sergeant at the desk.

The police sergeant jumped to his feet as the bedraggled man entered and stumbled to a bench.

"I'm Pat Brennan, street floor watchman of the Colossus," he said. "I ran for it. I got caught in the edge of the wreck and a brick clipped me. I musta been out for some time. When I came around I looked back just once at the wreck and then I beat it over here. Phone my boss."

"I'll let you phone your boss," said the sergeant, "but first tell me just what happened."

"Earthquake, I guess. I saw the floor heaving in waves. Glass was crashing and falling into the street. All windows in the arcade buckled, either in or out. I ran into the street and looked up. God, what a sight!

The building from sidewalk to towers was rocking and waving and twisting and buckling and I saw it was bound to crumple, so I lit out and ran. I heard a roar like all Hell broke loose and then something nicked me and my light went out."

"How many got caught in the building?"

"Nobody got out but me, I guess. There weren't many tenants. The building is all rented, but not everybody had moved in yet and those as had didn't spend their nights there. There was a watchman for every five stories. An engineer and his crew. Three elevator operators had come in. There was no names of tenants in or out on my book after 4 A.M. The crash musta come about 6. That's all."

Throughout the country the news of the crash was received with great interest and wonderment, but in one small circle it caused absolute consternation. That was in the offices of the Muller Construction Company, the builders of the Colossus. Jason V. Linane, chief engineer of the company, was in conference with its president, James J. Muller.

Muller sat with his head in his hands, and his face wore an expression of a man in absolute anguish. Linane was pacing the floor, a wild expression in his eyes, and at times he muttered and mumbled under his breath.

In the other offices the entire force from manager to office boys was hushed and awed, for they had seen the expressions on the faces of the heads of the concern when they stalked into the inner office that morning.

Muller finally looked up, rather hopelessly, at Linane.

"Unless we can prove that the crash was due to some circumstance over which we had no control, we are ruined," he said, and there actually were tears in his eyes.

"No doubt about that," agreed Linane, "but I can swear that the Colossus went up according to specifications and that every ounce and splinter of material was of the best. The workmanship was faultless. We have built scores of the biggest blocks in

the world and of them all this Colossus was the most perfect. I had prided myself on it. Muller, it was perfection. I simply cannot account for it. I cannot. It should have stood up for thousands of years. The foundation was solid rock. It positively was not an earthquake. No other building in the section was even jarred. No other earthquake was ever localized to one half block of the earth's crust, and we can positively eliminate an earthquake or an explosion as the possible cause. I am sure we are not to blame, but we will have to find the exact cause."

"If there was some flaw?" questioned Muller, although he knew the answer.

"If there was some flaw, then we're sunk. The newspapers are already clamoring for probes, of us, of the building, of the owners and everybody and everything. We have got to have something damned plausible when we go to bat on this proposition or every dollar we have in the world will have to be paid out."

"That is not all," said Muller: "not only will we be

penniless, but we may have to go to jail and we will never be able to show our faces in reputable business circles again. Who was the last to go over that building?"

"I sent Teddy Jenks. He is a cub and is swell headed and too big for his pants, but I would bank my life on his judgment. He has the judgment of a much older man and I would also bank my life and reputation on his engineering skill and knowledge. He pronounced the building positively O.K.—100 per cent."

"Where is Jenks?"

"He will be here as soon as his car can drive down from Tarrytown. He should be here now."

As they talked Jenks, the youngest member of the engineering force, entered. He entered like a whirlwind. He threw his hat on the floor and drew out a drawer of a cabinet. He pulled out the plans for the Colossus, big blue prints, some of them yards in extent, and threw them on the floor. Then he dropped to his knees and began poring over them.

"This is a hell of a time for you to begin getting around," exploded Muller. "What were you doing, cabareting all night?"

"It sure is terrible—awful," said Jenks, half to himself.

"Answer me," thundered Muller.

"Oh yes," said Jenks, looking up. He saw the look of anguish on his boss's face and forgot his own excitement in sympathy. He jumped to his feet, placed his arm about the shoulders of the older man and led him to a chair. Linane only scowled at the young man.

"I was delayed because I stopped by to see the wreck. My God, Mr. Muller, it is awful." Jenks drew his hand across his eye as if to erase the scene of the wrecked building. Then patting the older man affectionately on the back he said:

"Buck up. I'm on the job, as usual. I'll find out about it. It could not have been our fault. Why man, that building was as strong as Gibraltar itself!"

"You were the last to inspect it," accused Muller, with a break in his voice.

"Nobody knows that better than I, and I can swear by all that's square and honest that it was no fault of the material or the construction. It must have been—"

"Must have been what?"

"I'll be damned if I know."

"That's like him," said Linane, who, while really kindly intentioned, had always rather enjoyed prodding the young engineer.

"Like me, like the devil," shouted Jenks, glaring at Linane. "I suppose you know all about it, you're so blamed wise."

"No, I don't know," admitted Linane. "But I do know that you don't like me to tell you anything.

Nevertheless, I am going to tell you that you had better get busy and find out what caused it, or—"

"That's just what I'm doing," said Jenks, and he dived for his plans on the floor.

Newspaper reporters, many of them, were fighting outside to get in. Muller looked at Linane when a stenographer had announced the reporters for the tenth time.

"We had better let them in," he said, "it looks bad to crawl for cover."

"What are you going to tell them?" asked Linane.

"God only knows," said Muller.

"Let me handle them," said Jenks, looking up confidently.

The newspapermen had rushed the office. They came in like a wild wave. Questions flew like feathers at a cock-fight.

Muller held up his hand and there was something in his grief-stricken eyes that held the gentlemen of the

press in silence. They had time to look around. They saw the handsome, dark-haired, brown-eyed Jenks poring over the plans. Dust from the carpet smudged his knees, and he had rubbed some of it over a sweating forehead, but he still looked the picture of self-confident efficiency.

"Gentlemen," said Muller slowly, "I can answer all your questions at once. Our firm is one of the oldest and staunchest in the trade. Our buildings stand as monuments to our integrity—"

"All but one," said a young Irishman.

"You are right. All but one," confessed Muller. "But that one, believe me, has been visited by an act of God. Some form of earthquake or some unlooked for, uncontrolled, almost unbelievable catastrophe has happened. The Muller company stands back of its work to its last dollar. Gentlemen, you know as much as we do. Mr. Jenks there, whose reputation as an engineer is quite sturdy, I assure you, was the last to inspect the building. He passed upon it when it was finished. He is at your service."

Jenks arose, brushed some dust from his knees.

"You look like you'd been praying," bandied the Irishman.

"Maybe I have. Now let me talk. Don't broadside me with questions. I know what you want to know. Let me talk."

The newspapermen were silent.

"There has been talk of probing this disaster, naturally," began Jenks. "You all know, gentlemen, that we will aid any inquiry to our utmost. You want to know what we have to say about it—who is responsible. In a reasonable time I will have a statement to make that will be startling in the extreme. I am not sure of my ground now."

"How about the ground under the Colossus?" said the Irishman.

"Don't let's kid each other," pleaded Jenks. "Look at Mr. Muller: it is as if he had lost his whole family. We

are good people. I am doing all I can. Mr. Linane, who had charge of the construction, is doing all he can. We believe we are blameless. If it is proven otherwise we will acknowledge our fault, assume financial responsibility, and take our medicine. Believe me, that building was perfection plus, like all our buildings. That covers the entire situation."

Hundreds of questions were parried and answered by the three engineers, and the reporters left convinced that if the Muller Construction Company was responsible, it was not through any fault of its own.

The fact that Jenks and Linane were not strong for each other, except to recognize each other's ability as engineers, was due to an incident of the past. This incident had caused a ripple of mirth in engineering circles when it happened, and the laugh was on the older man, Linane.

It was when radio was new. Linane, a structural engineer, had paid little attention to radio. Jenks was the kind of an engineer who dabbled in all sciences. He knew his radio.

When Jenks first came to work with a technical sheepskin and a few tons of brass, Linane accorded him only passing notice. Jenks craved the plaudits of the older man and his palship. Linane treated him as a son, but did not warm to his social advances.

"I'm as good an engineer as he is," mused Jenks, "and if he is going to high-hat me, I'll just put a swift one over on him and compel his notice."

The next day Jenks approached Linane in conference and said:

"I've got a curious bet on, Mr. Linane. I am betting sound can travel a mile quicker than it travels a quarter of a mile."

"What?" said Linane.

"I'm betting fifty that sound can travel a mile quicker than it can travel a quarter of a mile."

"Oh no—it can't," insisted Linane.

"Oh yes—it can!" decided Jenks.

"I'll take some of that fool money myself," said Linane.

"How much?" asked Jenks.

"As much as you want."

"All right—five hundred dollars."

"How you going to prove your contention?"

"By stop watches, and your men can hold the watches. We'll bet that a pistol shot can be heard two miles away quicker than it can be heard a quarter of a mile away."

"Sound travels about a fifth of a mile a second. The rate varies slightly according to temperature," explained Linane. "At the freezing point the rate is 1,090 feet per second and increases a little over one foot for every degree Fahrenheit."

"Hot or cold," breezed Jenks, "I am betting you five

hundred dollars that sound can travel two miles quicker than a quarter-mile."

"You're on, you damned idiot!" shouted the completely exasperated Linane.

Jenks let Linane's friends hold the watches and his friend held the money. Jenks was to fire the shot.

Jenks fired the shot in front of a microphone on a football field. One of Linane's friends picked the sound up instantaneously on a three-tube radio set two miles away. The other watch holder was standing in the open a quarter of a mile away and his watch showed a second and a fraction.

All hands agreed that Jenks had won the bet fairly. Linane never exactly liked Jenks after that.

Then Jenks rather aggravated matters by a habit. Whenever Linane would make a very positive statement Jenks would look owl-eyed and say: "Mr. Linane, I'll have to sound you out about that." The heavy accent on the word "sound" nettled Linane

somewhat.

Linane never completely forgave Jenks for putting over this "fast one." Socially they were always more or less at loggerheads, but neither let this feeling interfere with their work. They worked together faithfully enough and each recognized the ability of the other.

And so it was that Linane and Jenks, their heads together, worked all night in an attempt to find some cause that would tie responsibility for the disaster on mother nature.

They failed to find it and, sleepy-eyed, they were forced to admit failure, so far.

The newspapers, to whom Muller had said that he would not shirk any responsibility, began a hue and cry for the arrest of all parties in any way concerned with the direction of the building of the Colossus.

When the death list from the crash and subway wreck reached 97, the press waxed nasty and demanded the

arrest of Muller, Linane and Jenks in no uncertain tones.

Half dead from lack of sleep, the three men were taken by the police to the district attorney's offices and, after a strenuous grilling, were formally placed under arrest on charges of criminal negligence. They put up a \$50,000 bond in each case and were permitted to go and seek further to find the cause of what the newspapers now began calling the "Colossal Failure."

Several days were spent by Linane and Jenks in examining the wreckage which was being removed from Times Square, truckload after truckload, to a point outside the city. Here it was again sorted and examined and piled for future disposal.

So far as could be found every brick, stone and ounce of material used in the building was perfect. Attorneys, however, assured Linane, Jenks and Muller that they would have to find the real cause of the disaster if they were to escape possible long prison sentences.

Night after night Jenks courted sleep, but it would not come. He began to grow wan and haggard.

Jenks took to walking the streets at night, mile after mile, thinking, always thinking, and searching his mind for a solution of the mystery.

It was evening. He had walked past the scene of the Colossus crash several times. He found himself on a side street. He looked up and saw in electric lights:

TOWN HALL

Munsterbergen, the Mad Musician

Concert Here To-night.

He took five dollars from his pocket and bought a ticket. He entered with the crowd and was ushered to a seat. He looked neither to the right or left. His eyes were sunken, his face lined with worry.

Something within Jenks caused him to turn slightly. He was curiously aware of a beautiful girl who sat beside him. She had a mass of golden hair which

seemed to defy control. It was wild, positively tempestuous. Her eyes were deep blue and her skin as white as fleecy clouds in spring. He was dimly conscious that those glorious eyes were troubled.

She glanced at him. She was aware that he was suffering. A great surge of sympathy welled in her heart. She could not explain the feeling.

A great red plush curtain parted in the center and drew in graceful folds to the edges of the proscenium. A small stage was revealed.

A tousle-headed man with glaring, beady black eyes, dressed in black evening clothes stepped forward and bowed. Under his arm was a violin. He brought the violin forward. His nose, like the beak of some great bird, bobbed up and down in acknowledgment of the plaudits which greeted him. His long nervous fingers began to caress the instrument and his lips began to move.

Jenks was aware that he was saying something, but was not at all interested. What he said was this:

"Maybe, yes, I couldn't talk so good English, but you could understood it, yes? Und now I tell you dot I never play the compositions of any man. I axtemporize exgloosively. I chust blay und blay, und maybe you should listen, yes? If I bleeze you I am chust happy."

Jenks' attention was drawn to him. He noted his wild appearance.

"He sure looks mad enough," mused Jenks.

The violinist flipped the fiddle up under his chin. He drew the bow over the strings and began a gentle melody that reminded one of rain drops falling on calm waters.

Jenks forgot his troubles. He forgot everything. He slumped in his seat and his eyes closed. The rain continued falling from the strings of the violin.

Suddenly the melody changed to a glad little lilting measure, as sweet as love itself. The sun was coming out again and the birds began to sing. There was the

trill of a canary with the sun on its cage. There was the song of the thrush, the mocking-bird and the meadow lark. These blended finally into a melodious burst of chirping melody which seemed a chorus of the wild birds of the forest and glen. Then the lilting love measure again. It tore at the heart strings, and brought tears to one's eyes.

Unconsciously the girl next to Jenks leaned towards him. Involuntarily he leaned to meet her. Their shoulders touched. The cloud of her golden hair came to rest against his dark locks. Their hands found each other with gentle pressure. Both were lost to the world.

Abruptly the music changed. There was a succession of broken treble notes that sounded like the crackling of flames. Moans deep and melancholy followed. These grew more strident and prolonged, giving place to abject howls, suggesting the lamentations of the damned.

The hands of the boy and girl gripped tensely. They could not help shuddering.

The violin began to produce notes of a leering, jeering character, growing more horrible with each measure until they burst in a loud guffaw of maniacal laughter.

The whole performance was as if someone had taken a heaven and plunged it into a hell.

The musician bowed jerkily, and was gone.

There was no applause, only wild exclamations. Half the house was on its feet. The other half sat as if glued to chairs.

The boy and the girl were standing, their hands still gripping tensely.

"Come, let's get out of here," said Jenks. The girl took her wrap and Jenks helped her into it. Hand in hand they fled the place.

In the lobby their eyes met, and for the first time they realized they were strangers. Yet deep in their hearts was a feeling that their fates had been sealed.

"My goodness!" burst from the girl.

"It can't be helped now," said Jenks decisively.

"What can't be helped?" asked the girl, although she knew in her heart.

"Nothing can be helped," said Jenks. Then he added: "We should know each other by this time. We have been holding hands for an hour."

The girl's eyes flared. "You have no right to presume on that situation," she said.

Jenks could have kicked himself. "Forgive me," he said. "It was only that I just wanted so to know you. Won't you let me see you home?"

"You may," said the girl simply, and she led the way to her own car.

They drove north.

Their bodies seemed like magnets. They were again

shoulder to shoulder, holding hands.

"Will you tell me your name?" pleaded Jenks.

"Surely," replied the girl. "I am Elaine Linane."

"What?" exploded Jenks. "Why, I work with a Linane, an engineer with the Muller Construction Company."

"He is my father," she said.

"Why, we are great friends," said the boy. "I am Jenks, his assistant—at least we work together."

"Yes, I have heard of you," said the girl. "It is strange, the way we met. My father admires your work, but I am afraid you are not great friends." The girl had forgotten her troubles. She chuckled. She had heard the way Jenks had "sounded" her father out.

Jenks was speechless. The girl continued:

"I don't know whether to like you or to hate you. My father is an old dear. You were cruel to him."

Jenks was abject. "I did not mean to be," he said. "He rather belittled me without realizing it. I had to make my stand. The difference in our years made him take me rather too lightly. I had to compel his notice, if I was to advance."

"Oh!" said the girl.

"I am sorry—so sorry."

"You might not have been altogether at fault," said the girl. "Father forgets at times that I have grown up. I resent being treated like a child, but he is the soul of goodness and fatherly care."

"I know that," said Jenks.

Every engineer knows his mathematics. It was this fact, coupled with what the world calls a "lucky break," that solved the Colossus mystery. Nobody can get around the fact that two and two make four.

Jenks had happened on accomplishment to advance in the engineering profession, and it was well for him

that he had reached a crisis. He had never believed in luck or in hunches, so it was good for him to be brought face to face with the fact that sometimes the footsteps of man are guided. It made him begin to look into the engineering of the universe, to think more deeply, and to acknowledge a Higher Power.

With Linane he had butted into a stone wall. They were coming to know what real trouble meant. The fact that they were innocent did not make the steel bars of a cage any more attractive. Their troubles began to wrap about them with the clammy intimacy of a shroud. Then came the lucky break.

Next to his troubles, Jenks' favorite topic was the Mad Musician. He tried to learn all he could about this uncanny character at whose concert he had met the girl of his life. He learned two facts that made him perk up and think.

One was that the Mad Musician had had offices and a studio in the Colossus and was one of the first to move in. The other was that the Mad Musician took great delight in shattering glassware with notes of or

vibrations from a violin. Nearly everyone knows that a glass tumbler can be shattered by the proper note sounded on a violin. The Mad Musician took delight in this trick. Jenks courted his acquaintance, and saw him shatter a row of glasses of different sizes by sounding different notes on his fiddle. The glasses crashed one after another like gelatine balls hit by the bullets of an expert rifleman.

Then Jenks, the engineer who knew his mathematics, put two and two together. It made four, of course.

"Listen, Linane," he said to his co-worker: "this fiddler is crazier than a flock of cuckoos. If he can crack crockery with violin sound vibrations, is it not possible, by carrying the vibrations to a much higher power, that he could crack a pile of stone, steel, brick and cement, like the Colossus?"

"Possible, but hardly probable. Still," Linane mused, "when you think about it, and put two and two together.... Let's go after him and see what he is doing now."

Both jumped for their coats and hats. As they fared forth, Jenks cinched his argument:

"If a madman takes delight in breaking glassware with a vibratory wave or vibration, how much more of a thrill would he get by crashing a mountain?"

"Wild, but unanswerable," said Linane.

Jenks had been calling on the Mad Musician at his country place. "He had a studio in the Colossus," he reminded Linane. "He must have re-opened somewhere else in town. I wonder where."

"Musicians are great union men," said Linane. "Phone the union."

Teddy Jenks did, but the union gave the last known town address as the Colossus.

"He would remain in the same district around Times Square," reasoned Jenks. "Let's page out the big buildings and see if he is not preparing to crash another one."

"Fair enough," said Linane, who was too busy with the problem at hand to choose his words.

Together the engineers started a canvass of the big buildings in the theatrical district. After four or five had been searched without result they entered the 30-story Acme Theater building.

Here they learned that the Mad Musician had leased a four-room suite just a few days before. This suite was on the fifteenth floor, just half way up in the big structure.

They went to the manager of the building and frankly stated their suspicions. "We want to enter that suite when the tenant is not there," they explained, "and we want him forestalled from entering while we are examining the premises."

"Hadn't we better notify the police?" asked the building manager, who had broken out in a sweat when he heard the dire disaster which might be in store for the stately Acme building.

"Not yet," said Linane. "You see, we are not sure: we have just been putting two and two together."

"We'll get the building detective, anyway," insisted the manager.

"Let him come along, but do not let him know until we are sure. If we are right we will find a most unusual infernal machine," said Linane.

The three men entered the suite with a pass-key. The detective was left outside in the hall to halt anyone who might disturb the searchers. It was as Jenks had thought. In an inner room they found a diabolical machine—a single string stretched across two bridges, one of brass and one of wood. A big horsehair bow attached to a shaft operated by a motor was automatically sawing across the string.

IMAGEDescription

The note resulting was evidently higher than the range of the human ear, because no audible sound resulted. It was later estimated that the destructive note was several octaves higher than the highest note

on a piano.

The entire machine was enclosed in a heavy wire-net cage, securely bolted to the floor. Neither the string or bow could be reached. It was evidently the Mad Musician's idea that the devilish contrivance should not be reached by hands other than his own.

How long the infernal machine had been operating no one knew, but the visitors were startled when the building suddenly began to sway perceptibly. Jenks jumped forward to stop the machine but could not find a switch.

"See if the machine plugs in anywhere in a wall socket!" he shouted to Linane, who promptly began examining the walls. Jenks shouted to the building manager to phone the police to clear the streets around the big building.

"Tell the police that the Acme Theater building may crash at any moment," he instructed.

The engineers were perfectly cool in face of the great

peril, but the building manager lost his head completely and began to run around in circles muttering: "Oh, my God, save me!" and other words of supplication that blended into an incoherent babel.

Jenks rushed to the man, trying to still his wild hysteria.

The building continued to sway dangerously.

Jenks looked from a window. An enormous crowd was collecting, watching the big building swinging a foot out of plumb like a giant pendulum. The crowd was growing. Should the building fall the loss of life would be appalling. It was mid-morning. The interior of the building teemed with thousands of workers, for all floors above the third were offices.

Teddy Jenks turned suddenly. He heard the watchman in the hall scream in terror. Then he heard a body fall. He rushed to the door to see the Mad Musician standing over the prostrate form of the detective, a devilish grin on his distorted countenance.

The madman turned, saw Jenks, and started to run. Jenks took after him. Up the staircase the madman rushed toward the roof. Teddy followed him two floors and then rushed out to take the elevators. The building in its mad swaying had made it impossible for the lifts to be operated. Teddy realized this with a distraught gulp in his throat. He returned to the stairway and took up the pursuit of the madman.

The corridors were beginning to fill with screaming men and wailing girls. It was a sight never to be forgotten.

Laboriously Jenks climbed story after story without getting sight of the madman. Finally he reached the roof. It was waving like swells on a lake before a breeze. He caught sight of the Mad Musician standing on the street wall, thirty stories from the street, a leer on his devilish visage. He jumped for him.

The madman grasped him and lifted him up to the top of the wall as a cat might have lifted a mouse. Both men were breathing heavily as a result of their 15-story climb.

The madman tried to throw Teddy Jenks to the street below. Teddy clung to him. The two battled desperately as the building swayed.

The dense crowd in the street had caught sight of the two men fighting on the narrow coping, and the shout which rent the air reached the ears of Jenks.

The mind of the engineer was still working clearly, but a wild fear gripped his heart. His strength seemed to be leaving him. The madman pushed him back, bending his spine with brute strength. Teddy was forced to the narrow ledge that had given the two men footing. The fingers of the madman gripped his throat.

He was dimly conscious that the swaying of the building was slowing down. His reason told him that Linane had found the wall socket and had stopped the sawing of the devil's bow on the engine of hell.

He saw the madman draw a big knife. With his last remaining strength he reached out and grasped the wrist above the hand which held the weapon. In spite

of all he could do he saw the madman inching the knife nearer and nearer his throat.

Grim death was peering into the bulging eyes of Teddy Jenks, when his engineering knowledge came to his rescue. He remembered the top stories of the Acme building were constructed with a step of ten feet in from the street line, for every story of construction above the 24th floor.

"If we fall," he reasoned, "we can only fall one story." Then he deliberately rolled his own body and the weight of the madman, who held him, over the edge of the coping. At the same time he twisted the madman's wrist so the point of the knife pointed to the madman's body.

There was a dim consciousness of a painful impact. Teddy had fallen underneath, but the force of the two bodies coming together had thrust the knife deep into the entrails of the Mad Musician.

Clouds which had been collecting in the sky began a splattering downpour. The storm grew in fury and

lightning tore the heavens, while thunder boomed and crackled. The rain began falling in sheets.

This served to revive the unconscious Teddy. He painfully withdrew his body from under that of the madman. The falling rain, stained with the blood of the Mad Musician, trickled over the edge of the building.

Teddy dragged himself through a window and passed his hand over his forehead, which was aching miserably. He tried to get to his feet and fell back, only to try again. Several times he tried and then, his strength returning, he was able to walk.

He made his way to the studio where he had left Linane and found him there surrounded by police, reporters and others. The infernal machine had been rendered harmless, but was kept intact as evidence.

Catching sight of Teddy, Linane shouted with joy. "I stopped the damned thing," he chuckled, like a pleased schoolboy. Then, observing Teddy's exhausted condition he added:

"Why, you look like you have been to a funeral!"

"I have," said Teddy. "You'll find that crazy fiddler dead on the twenty-ninth story. Look out the window of the thirtieth story," he instructed the police, who had started to recover the body. "He stabbed himself. He is either dead or dying."

It proved that he was dead.

No engineering firm is responsible for the actions of a madman. So the Muller Construction Company was given a clean bill of health.

Jenks and Elaine Linane were with the girl's father in his study. They were asking for the paternal blessing.

Linane was pretending to be hard to convince.

"Now, my daughter," he said, "this young man takes \$500 of my good money by sounding me out, as he calls it. Then he comes along and tries to take my daughter away from me. It is positively high-handed. It dates back to the football game—"

"Daddy, dear, don't be like that!" said Elaine, who was on the arm of his chair with her own arms around him.

"I tell you, Elaine, this dates back to the fall of 1927."

"It dates back to the fall of Eve," said Elaine. "When a girl finds her man, no power can keep him from her. If you won't give me to Teddy Jenks, I'll elope with him."

"Well, all right then. Kiss me," said Linane as he turned towards his radio set.

"One and one makes one," said Teddy Jenks.

Every engineer knows his mathematics.

#14 The Thief of Time, by Sterner St. Paul Meek:

The teller turned to the stacked pile of bills. They were gone! And no one had been near!

Aproximate word count: 8,100

Bigotry:

Warnings:

- - -

Harvey Winston, paying teller of the First National Bank of Chicago, stripped the band from a bundle of twenty dollar bills, counted out seventeen of them and added them to the pile on the counter before him.

The teller turned to the stacked pile of bills. They were gone! And no one had been near!

"Twelve hundred and thirty-one tens," he read from the payroll change slip before him. The paymaster of the Cramer Packing Company nodded an assent and Winston turned to the stacked bills in his rear

currency rack. He picked up a handful of bundles and turned back to the grill. His gaze swept the counter where, a moment before, he had stacked the twenties, and his jaw dropped.

"You got those twenties, Mr. Trier?" he asked.

"Got them? Of course not, how could I?" replied the paymaster. "There they are...."

His voice trailed off into nothingness as he looked at the empty counter.

"I must have dropped them," said Winston as he turned. He glanced back at the rear rack where his main stock of currency was piled. He stood paralyzed for a moment and then reached under the counter and pushed a button.

The bank resounded instantly to the clangor of gongs and huge steel grills shot into place with a clang, sealing all doors and preventing anyone from entering or leaving the bank. The guards sprang to their stations with drawn weapons and from the inner

offices the bank officials came swarming out. The cashier, followed by two men, hurried to the paying teller's cage.

"What is it, Mr. Winston?" he cried.

"I've been robbed!" gasped the teller.

"Who by? How?" demanded the cashier.

"I—I don't know, sir," stammered the teller. "I was counting out Mr. Trier's payroll, and after I had stacked the twenties I turned to get the tens. When I turned back the twenties were gone."

"Where had they gone?" asked the cashier.

"I don't know, sir. Mr. Trier was as surprised as I was, and then I turned back, thinking that I had knocked them off the counter, and I saw at a glance that there was a big hole in my back racks. You can see yourself, sir."

The cashier turned to the paymaster.

"Is this a practical joke, Mr. Trier?" he demanded sharply.

"Of course not," replied the paymaster. "Winston's grill was closed. It still is. Granted that I might have reached the twenties he had piled up, how could I have gone through a grill and taken the rest of the missing money without his seeing me? The money disappeared almost instantly. It was there a moment before, for I noticed when Winston took the twenties from his rack that it was full."

"But someone must have taken it," said the bewildered cashier. "Money doesn't walk off of its own accord or vanish into thin air—"

A bell interrupted his speech.

"There are the police," he said with an air of relief. "I'll let them in."

The smaller of the two men who had followed the cashier from his office when the alarm had sounded stepped forward and spoke quietly. His voice was low

and well pitched yet it carried a note of authority and power that held his auditors' attention while he spoke. The voice harmonized with the man. The most noticeable point about him was the inconspicuousness of his voice and manner, yet there was a glint of steel in his gray eyes that told of enormous force in him.

"I don't believe that I would let them in for a few moments, Mr. Rogers," he said. "I think that we are up against something a little different from the usual bank robbery."

"But, Mr. Carnes," protested the cashier, "we must call in the police in a case like this, and the sooner they take charge the better chance there will be of apprehending the thief."

"Suit yourself," replied the little man with a shrug of his shoulders. "I merely offered my advice."

"Will you take charge, Mr. Carnes?" asked the cashier.

"I can't supersede the local authorities in a case like this," replied Carnes. "The secret service is primarily

interested in the suppression of counterfeiting and the enforcement of certain federal statutes, but I will be glad to assist the local authorities to the best of my ability, provided they desire my help. My advice to you would be to keep out the patrolmen who are demanding admittance and get in touch with the chief of police. I would ask that his best detective together with an expert finger-print photographer be sent here before anyone else is admitted. If the patrolmen are allowed to wipe their hands over Mr. Winston's counter they may destroy valuable evidence."

"You are right, Mr. Carnes," exclaimed the cashier. "Mr. Jervis, will you tell the police that there is no violence threatening and ask them to wait for a few minutes? I'll telephone the chief of police at once."

As the cashier hurried away to his telephone Carnes turned to his companion who had stood an interested, although silent spectator of the scene. His companion was a marked contrast to the secret service operator. He stood well over six feet in height, and his protruding jaw and shock of unruly black hair combined with his massive shoulders and chest to

give him the appearance of a man who labored with his hands—until one looked at them. His hands were in strange contrast to the rest of him. Long, slim, mobile hands they were, with tapering nervous fingers—the hands of a thinker or of a musician. Telltale splotches of acid told of hours spent in a laboratory, a tale that was confirmed by the almost imperceptible stoop of his shoulders.

"Do you agree with my advice, Dr. Bird?" asked Carnes deferentially.

The noted scientist, who from his laboratory in the Bureau of Standards had sent forth many new things in the realms of chemistry and physics, and who, incidentally, had been instrumental in solving some of the most baffling mysteries which the secret service had been called upon to face, grunted.

"It didn't do any harm," he said, "but it is rather a waste of time. The thief wore gloves."

"How in thunder do you know that?" demanded Carnes.

"It's merely common sense. A man who can do what he did had at least some rudiments of intelligence, and even the feeblest-minded crooks know enough to wear gloves nowadays."

Carnes stepped a little closer to the doctor.

"Another reason why I didn't want patrolmen tramping around," he said in an undertone, "is this. If Winston gave the alarm quickly enough, the thief is probably still in the building."

"He's a good many miles away by now," replied Dr. Bird with a shrug of his shoulders.

Carnes' eyes opened widely. "Why?—how?—who?" he stammered. "Have you any idea of who did it, or how it was done?"

"Possibly I have an idea," replied Dr. Bird with a cryptic smile. "My advice to you, Carnes, is to keep away from the local authorities as much as possible. I want to be present when Winston and Trier are questioned and I may possibly wish to ask a few

questions myself. Use your authority that far, but no farther. Don't volunteer any information and especially don't let my name get out. We'll drop the counterfeiting case we were summoned here on for the present and look into this a little on our own hook. I will want your aid, so don't get tied up with the police."

"At that, we don't want the police crossing our trail at every turn," protested Carnes.

"They won't," promised the doctor. "They will never get any evidence on this case, if I am right, and neither will we—for the present. Our stunt is to lie low and wait for the next attempt of this nature and thus accumulate some evidence and some idea of where to look."

"Will there be another attempt?" asked Carnes.

"Surely. You don't expect a man who got away with a crime like this to quit operations just because a few flatfeet run around and make a hullabaloo about it, do you? I may be wrong in my assumption, but if I am

right, the most important thing is to keep all reference to my name or position out of the press reports."

The cashier hastened up to them.

"Detective-Captain Sturtevant will be here in a few minutes with a photographer and some other men," he said. "Is there anything that we can do in the meantime, Mr. Carnes?"

"I would suggest that Mr. Trier and his guard and Mr. Winston go into your office," replied Carnes. "My assistant and I would like to be present during the questioning, if there are no objections."

"I didn't know that you had an assistant with you," answered the cashier.

Carnes indicated Dr. Bird.

"This gentleman is Mr. Berger, my assistant," he said. "Do you understand?"

"Certainly. I am sure there will be no objection to your presence, Mr. Carnes," replied the cashier as he led the way to his office.

A few minutes later Detective-Captain Sturtevant of the Chicago police was announced. He acknowledged the introductions gruffly and got down to business at once.

"What were the circumstances of the robbery?" he asked.

Winston told his story, Trier and the guard confirming it.

"Pretty thin!" snorted the detective when they had finished. He whirled suddenly on Winston.

"Where did you hide the loot?" he thundered.

"Why—uh—er—what do you mean?" gulped the teller.

"Just what I said," replied the detective. "Where did you hide the loot?"

"I didn't hide it anywhere," said the teller. "It was stolen."

"You had better think up a better one," sneered Sturtevant. "If you think that you can make me believe that that money was stolen from you in broad daylight with two men in plain sight of you who didn't see it, you might just as well get over it. I know that you have some hiding place where you have slipped the stuff and the quicker you come clean and spill it, the better it will be for you. Where did you hide it?"

"I didn't hide it!" cried the teller, his voice trembling. "Mr. Trier can tell you that I didn't touch it from the time I laid it down until I turned back."

"That's right," replied the paymaster. "He turned his back on me for a moment, and when he turned back, it was gone."

"So you're in on it too, are you?" said Sturtevant.

"What do you mean?" demanded the paymaster hotly.

"Oh nothing, nothing at all," replied the detective. "Of course Winston didn't touch it and it disappeared and you never saw it go, although you were within three feet of it all the time. Did *you* see anything?" he demanded of the guard.

"Nothing that I am sure of," answered the guard. "I thought that a shadow passed in front of me for an instant, but when I looked again, it was gone."

Dr. Bird sat forward suddenly. "What did this shadow look like?" he asked.

"It wasn't exactly a shadow," said the guard. "It was as if a person had passed suddenly before me so quickly that I couldn't see him. I seemed to feel that there was someone there, but I didn't rightly *see* anything."

"Did you notice anything of the sort?" demanded the doctor of Trier.

"I don't know," replied Trier thoughtfully. "Now that Williams has mentioned it, I did seem to feel a breath

of air or a motion as though something had passed in front of me. I didn't think of it at the time."

"Was this shadow opaque enough to even momentarily obscure your vision?" went on the doctor.

"Not that I am conscious of. It was just a breath of air such as a person might cause by passing very rapidly."

"What made you ask Trier if he had the money when you turned around?" asked the doctor of Winston.

"Say-y-y," broke in the detective. "Who the devil are you, and what do you mean by breaking into my examination and stopping it?"

Carnes tossed a leather wallet on the table.

"There are my credentials," he said in his quiet voice. "I am chief of one section of the United States Secret Service as you will see, and this is Mr. Berger, my assistant. We were in the bank, engaged on a

counterfeiting case, when the robbery took place. We have had a good deal of experience along these lines and we are merely anxious to aid you."

Sturtevant examined Carnes' credentials carefully and returned them.

"This is a Chicago robbery," he said, "and we have had a little experience in robberies and in apprehending robbers ourselves. I think that we can get along without your help."

"You have had more experience with robberies than with apprehending robbers if the papers tell the truth," said Dr. Bird with a chuckle.

The detective's face flushed.

"That will be enough from you, Mr. Sherlock Holmes," he said. "If you open your mouth again, I'll arrest you as a material witness and as a possible accomplice."

"That sounds like Chicago methods," said Carnes quietly. "Now listen to me, Captain. My assistant and I

are merely trying to assist you in this case. If you don't desire our assistance we'll proceed along our own lines without interfering, but in the meantime remember that this is a National Bank, and that our questions will be answered. The United States is higher than even the Chicago police force, and I am here under orders to investigate a counterfeiting case. If I desire, I can seal the doors of this bank and allow no one in or out until I have the evidence I desire. Do you understand?"

Sturtevant sprang to his feet with an oath, but the sight of the gold badge which Carnes displayed stopped him.

"Oh well," he said ungraciously. "I suppose that no harm will come of letting Winston answer your fool questions, but I'll warn you that I'll report to Washington that you are interfering with the course of justice and using your authority to aid the getaway of a criminal."

"That is your privilege," replied Carnes quietly. "Mr. Winston, will you answer Mr. Berger's question?"

"Why, I asked him because he was right close to the money and I thought that he might have reached through the wicket and picked it up. Then, too—"

He hesitated for a moment and Dr. Bird smiled encouragingly.

"What else?" he asked.

"Why, I can't exactly tell. It just seemed to me that I had heard the rustle that bills make when they are pulled across a counter. When I saw them gone, I thought that he might have taken them. Then when I turned toward him, I seemed to hear the rustle of bills behind me, although I knew that I was alone in the cage. When I looked back the money was gone."

"Did you see or hear anything like a shadow or a person moving?"

"No—yes—I don't know. Just as I turned around it seemed to me that the rear door to my cage had moved and there may have been a shadow for an instant. I don't know. I hadn't thought of it before."

"How long after that did you ring the alarm gongs?"

"Not over a second or two."

"That's all," said Dr. Bird.

"If your high and mightiness has no further questions to ask, perhaps you will let me ask a few," said Sturtevant.

"Go ahead, ask all you wish," replied Dr. Bird with a laugh. "I have all the information I desire here for the present. I may want to ask other questions later, but just now I think we'll be going."

"If you find any strange finger-prints on Winston's counter, I'll be glad to have them compared with our files," said Carnes.

"I am not bothering with finger-prints," snorted the detective. "This is an open and shut case. There would be lots of Winston's finger-prints there and no others. There isn't the slightest doubt that this is an inside case and I have the men I want right here. Mr.

Rogers, your bank is closed for to-day. Everyone in it will be searched and then all those not needed to close up will be sent away. I will get a squad of men here to go over your building and locate the hiding place. Your money is still on the premises unless these men slipped it to a confederate who got out before the alarm was given. I'll question the guards about that. If that happened, a little sweating will get it out of them."

"Are you going to arrest me?" demanded Trier in surprise.

"Yes, dearie," answered the detective. "I am going to arrest you and your two little playmates if these Washington experts will allow me to. You will save a lot of time and quite a few painful experiences if you will come clean now instead of later."

"I demand to see my lawyer and to communicate with my firm," said the paymaster.

"Time enough for that when I am through with you," replied the detective.

He turned to Carnes.

"Have I your gracious permission to arrest these three criminals?" he asked.

"Yes indeed, Captain," replied Carnes sweetly. "You have my gracious permission to make just as big an ass of yourself as you wish. We're going now."

"By the way, Captain," said Dr. Bird as he followed Carnes out. "When you get through playing with your prisoners and start to look for the thief, here is a tip. Look for a left-handed man who has a thorough knowledge of chemistry and especially toxicology."

"It's easy enough to see that he was left-handed if he pulled that money out through the grill from the positions occupied by Trier and his guard, but what the dickens led you to suspect that he is a chemist and a toxicologist?" asked Carnes as he and the doctor left the bank.

"Merely a shrewd guess, my dear Watson," replied the doctor with a chuckle. "I am likely to be wrong, but

there is a good chance that I am right. I am judging solely from the method used."

"Have you solved the method?" demanded Carnes in amazement. "What on earth was it? The more I have thought about it, the more inclined I am to believe that Sturtevant is right and that it is an inside job. It seems to me impossible that a man could have entered in broad daylight and lifted that money in front of three men and within sight of a hundred more without some one getting a glimpse of him. He must have taken the money out in a grip or a sack or something like that, yet the bank record shows that no one but Trier entered with a grip and no one left with a package for ten minutes before Trier entered."

"There may be something in what you say, Carnes, but I am inclined to have a different idea. I don't think it is the usual run of bank robbery, and I would rather not hazard a guess just now. I am going back to Washington to-night. Before I go any further into the matter, I need some rather specialized knowledge that I don't possess and I want to consult with Dr. Knolles. I'll be back in a week or so and then we can

look into that counterfeiting case after we get this disposed of."

"What am I to do?" asked Carnes.

"Sit around the lobby of your hotel, eat three meals a day, and read the papers. If you get bored, I would recommend that you pay a visit to the Art Institute and admire the graceful lions which adorn the steps. Artistic contemplations may well improve your culture."

"All right," replied Carnes. "I'll assume a pensive air and moon at the lions, but I might do better if you told me what I was looking for."

"You are looking for knowledge, my dear Carnes," said the doctor with a laugh. "Remember the saying of the sages: To the wise man, no knowledge is useless."

A huge Martin bomber roared down to a landing at the Maywood airdrome, and a burly figure descended from the rear cockpit and waved his hand jovially to

the waiting Carnes. The secret service man hastened over to greet his colleague.

"Have you got that truck I wired you to have ready?" demanded the doctor.

"Waiting at the entrance; but say, I've got some news for you."

"It can wait. Get a detail of men and help us to unload this ship. Some of the cases are pretty heavy."

Carnes hurried off and returned with a gang of laborers, who took from the bomber a dozen heavy packing cases of various sizes, several of them labelled either "Fragile" or "Inflammable" in large type.

"Where do they go, Doctor?" he asked when the last of them had been loaded onto the waiting truck.

"To the First National Bank," replied Dr. Bird, "and Casey here goes with them. You know Casey, don't you, Carnes? He is the best photographer in the

Bureau."

"Shall I go along too?" asked Carnes as he acknowledged the introduction.

"No need for it. I wired Rogers and he knows the stuff is coming and what to do with it. Unpack as soon as you get there, Casey, and start setting up as soon as the bank closes."

"All right, Doctor," replied Casey as he mounted the truck beside the driver.

"Where do we go, Doctor?" asked Carnes as the truck rolled off.

"To the Blackstone Hotel for a bath and some clean clothes," replied the doctor. "And now, what is the news you have for me?"

"The news is this, Doctor. I carried out your instructions diligently and, during the daylight hours, the lions have not moved."

Dr. Bird looked contrite.

"I beg your pardon, Carnes," he said. "I really didn't think when I left you so mystified how you must have felt. Believe me, I had my own reasons, excellent ones, for secrecy."

"I have usually been able to maintain silence when asked to," replied Carnes stiffly.

"My dear fellow, I didn't mean to question your discretion. I know that whatever I tell you is safe, but there are angles to this affair that are so weird and improbable that I don't dare to trust my own conclusions, let alone share them. I'll tell you all about it soon. Did you get those tickets I wired for?"

"Of course I got them, but what have two tickets to the A. A. U. track meet this afternoon got to do with a bank robbery?"

"One trouble with you, Carnes," replied the doctor with a judicial air, "is that you have no idea of the importance of proper relaxation. Is it possible that

you have no desire to see Ladd, this new marvel who is smashing records right and left, run? He performs for the Illinois Athletic Club this afternoon, and it would not surprise me to see him lower the world's record again. He has already lowered the record for the hundred yard dash from nine and three-fifths to eight and four-fifths. There is no telling what he will do."

"Are we going to waste the whole afternoon just to watch a man run?" demanded Carnes in disgust.

"We will see many men run, my dear fellow, but there is only one in whom I have a deep abiding interest, and that is Mr. Ladd. Have you your binoculars with you?"

"No."

"Then by all means beg, borrow or steal two pairs before this afternoon. We might easily miss half the fun without them. Are our seats near the starting line for the sprints?"

"Yes. The big demand was for seats near the finish line."

"The start will be much more interesting, Carnes. I was somewhat of a minor star in track myself in my college days and it will be of the greatest interest to me to observe the starting form of this new speed artist. Now Carnes, don't ask any more questions. I may be barking up the wrong tree and I don't want to give you a chance to laugh at me. I'll tell you what to watch for at the track."

The sprinters lined up on the hundred yard mark and Dr. Bird and Carnes sat with their glasses glued to their eyes watching the slim figure in the colors of the Illinois Athletic Club, whose large "62" on his back identified him as the new star.

"On your mark!" cried the starter. "Get set!"

"Ah!" cried Dr. Bird. "Did you see that Carnes?"

The starting gun cracked and the runners were off on their short grind. Ladd leaped into the lead and

rapidly distanced the field, his legs twinkling under him almost faster than the eye could follow. He was fully twenty yards in the lead when his speed suddenly lessened and the balance of the runners closed up the gap he had opened. His lead was too great for them, and he was still a good ten yards in the lead when he crossed the tape. The official time was posted as eight and nine-tenths seconds.

"Another thirty yards and he would have been beaten," said Carnes as he lowered his glasses.

"That is the way he has won all of his races," replied the doctor. "He piles up a huge lead at first and then loses a good deal at the finish. His speed doesn't hold up. Never mind that, though, it is only an additional point in my favor. Did you notice his jaws just before the gun went?"

"They seemed to clench and then he swallowed, but most of them did some thing like that."

"Watch him carefully for the next heat and see if he puts anything into his mouth. That is the important

thing."

Dr. Bird sank into a brown study and paid no attention to the next few events, but he came to attention promptly when the final heat of the hundred yard dash was called. With his glasses he watched Ladd closely as the runner trotted up to the starting line.

"There, Carnes!" he cried suddenly. "Did you see?"

"I saw him wipe his mouth," said Carnes doubtfully.

"All right, now watch his jaws just before the gun goes."

The final heat was a duplicate of the first preliminary. Ladd took an early lead which he held for three-fourths of the distance to the tape, then his pace slackened and he finished only a bare ten yards ahead of the next runner. The time tied his previous world's record of eight and four-fifths seconds.

"He crunched and swallowed all right, Doctor," said Carnes.

"That is all I wanted to be sure of. Now Carnes, here is something for you to do. Get hold of the United States Commissioner and get a John Doe warrant and go back to the hotel with it and wait for me. I may phone you at any minute and I may not. If I don't, wait in your room until you hear from me. Don't leave it for a minute."

"Where are you going, Doctor?"

"I'm going down and congratulate Mr. Ladd. An old track man like me can't let such an opportunity pass."

"I don't know what this is all about, Doctor," replied Carnes, "but I know you well enough to obey orders and to keep my mouth shut until it is my turn to speak."

Few men could resist Dr. Bird when he set out to make a favorable impression, and even a world's champion is apt to be flattered by the attention of one of the greatest scientists of his day, especially when that scientist has made an enviable reputation as an athlete in his college days and can talk the jargon of

the champion's particular sport. Henry Ladd promptly capitulated to the charm of the doctor and allowed himself to be led away to supper at Bird's club. The supper passed off pleasantly, and when the doctor requested an interview with the young athlete in a private room, he gladly consented. They entered the room together, remained for an hour and a half, and then came out. The smile had left Ladd's face and he appeared nervous and distracted. The doctor talked cheerfully with him but kept a firm grip on his arm as they descended the stairs together. They entered a telephone booth where the doctor made several calls, and then descended to the street, where they entered a taxi.

"Maywood airdrome," the doctor told the driver.

Two hours later the big Martin bomber which had carried the doctor to Chicago roared away into the night, and Bird turned back, reentered the taxi, and headed for the city alone.

When Carnes received the telephone call, which was one of those the doctor made from the booth in his

club, he hurried over to the First National Bank. His badge secured him an entrance and he found Casey busily engaged in rigging up an elaborate piece of apparatus on one of the balconies where guards were normally stationed during banking hours.

"Dr. Bird said to tell you to keep on the job all night if necessary," he told Casey. "He thinks he will need your machine to-morrow."

"I'll have it ready to turn on the power at four A.M.," replied Casey.

Carnes watched him curiously for a while as he soldered together the electrical connections and assembled an apparatus which looked like a motion picture projector.

"What are you setting up?" he asked at length.

"It is a high speed motion picture camera," replied Casey, "with a telescopic lens. It is a piece of apparatus which Dr. Bird designed while he was in Washington last week and which I made from his

sketches, using some apparatus we had on hand. It's a dandy, all right."

"What is special about it?"

"The speed. You know how fast an ordinary movie is taken, don't you? No? Well, it's sixteen exposures per second. The slow pictures are taken sometimes at a hundred and twenty-eight or two hundred and fifty-six exposures per second, and then shown at sixteen. This affair will take half a million pictures per second."

"I didn't know that a film would register with that short an exposure."

"That's slow," replied Casey with a laugh. "It all depends on the light. The best flash-light powder gives a flash about one ten-thousandth of a second in duration, but that is by no means the speed limit of the film. The only trouble is enough light and sufficient shutter speed. Pictures have been taken by means of spark photography with an exposure of less than one three-millionth of a second. The whole

secret of this machine lies in the shutter. This big disc with the slots in the edge is set up before the lens and run at such a speed that half a million slots per second pass before the lens. The film, which is sixteen millimeter X-ray film, travels behind the lens at a speed of nearly five miles per second. It has to be gradually worked up to this speed, and after the whole thing is set up, it takes it nearly four hours to get to full speed."

"At that speed, it must take a million miles of film before you get up steam."

"It would, if the film were being exposed. There is only about a hundred yards of film all told, which will run over these huge drums in an endless belt. There is a regular camera shutter working on an electric principle which remains closed. When the switch is tripped, the shutter opens in about two thirty-thousandths of a second, stays open just one one-hundredth of a second, and then closes. This time is enough to expose nearly all of our film. When we have our picture, I shut the current down, start applying a magnetic brake, and let it slow down. It takes over an

hour to stop it without breaking the film. It sounds complicated, but it works all right."

"Where is your switch?"

"That is the trick part of it. It is a remote control affair. The shutter opens and starts the machine taking pictures when the back door of the paying teller's cage is opened half an inch. There is also a hand switch in the line that can be opened so that you can open the door without setting off the camera, if you wish. When the hand switch is closed and the door opened, this is what happens. The shutter on the camera opens, the machine takes five thousand pictures during the next hundredth of a second, and then the shutter closes. Those five thousand exposures will take about five minutes to show at the usual rate of sixteen per second."

"You said that you had to get plenty of light. How are you managing that?"

"The camera is equipped with a special lens ground out of rock crystal. This lens lets in ultra-violet light

which the ordinary lens shuts out, and X-ray film is especially sensitive to ultra-violet light. In order to be sure that we get enough illumination, I will set up these two ultra-violet floodlights to illumine the cage. The teller will have to wear glasses to protect his eyes and he'll get well sunburned, but something has to be sacrificed to science, as Dr. Bird is always telling me."

"It's too deep for me," said Carnes with a sigh. "Can I do anything to help? The doctor told me to stand by and do anything I could."

"I might be able to use you a little if you can use tools," said Casey with a grin. "You can start bolting together that light proof shield if you want to."

"Well, Carnes, did you have an instructive night?" asked Dr. Bird cheerfully as he entered the First National Bank at eight-thirty the next morning.

"I don't see that I did much good, Doctor. Casey would have had the machine ready on time anyway, and I'm no machinist."

"Well, frankly, Carnes, I didn't expect you to be of much help to him, but I did want you to see what Casey was doing, and a little of it was pretty heavy for him to handle alone. I suppose that everything is ready?"

"The motor reached full speed about fifteen minutes ago and Casey went out to get a cup of coffee. Would you mind telling me the object of the whole thing?"

"Not at all. I plan to make a permanent record of the work of the most ingenious bank robber in the world. I hope he keeps his word."

"What do you mean?"

"Three days ago when Sturtevant sweated a 'confession' out of poor Winston, the bank got a message that the robbery would be repeated this morning and dared them to prevent it. Rogers thought it was a hoax, but he telephoned me and I worked the Bureau men night and day to get my camera ready in time for him. I am afraid that I can't do much to prevent the robbery, but I may be able to

take a picture of it and thus prevent other cases of a like nature."

"Was the warning written?"

"No. It was telephoned from a pay station in the loop district, and by the time it was traced and men got there, the telephoner was probably a mile away. He said that he would rob the same cage in the same manner as he did before."

"Aren't you taking any special precautions?"

"Oh, yes, the bank is putting on extra guards and making a lot of fuss of that sort, probably to the great amusement of the robber."

"Why not close the cage for the day?"

"Then he would rob a different one and we would have no way of photographing his actions. To be sure, we will put dummy money there, bundles with bills on the outside and paper on the inside, so if I don't get a picture of him, he won't get much. Every bill in the

cage will be marked as well."

"Did he say at what time he would operate?"

"No, he didn't, so we'll have to stand by all day. Oh, hello, Casey, is everything all right?"

"As sweet as chocolate candy, Doctor. I have tested it out thoroughly, and unless we have to run it so long that the film wears out and breaks, we are sitting pretty. If we don't get the pictures you are looking for, I'm a dodo, and I haven't been called that yet."

"Good work, Casey. Keep the bearings oiled and pray that the film doesn't break."

The bank had been opened only ten minutes when the clangor of gongs announced a robbery. It was practically a duplicate of the first. The paying teller had turned from his window to take some bills from his rack and had found several dozens of bundles missing. As the gongs sounded, Dr. Bird and Casey leaped to the camera.

"She snapped, Doctor!" cried Casey as he threw two switches. "It'll take an hour to stop and half a day to develop the film, but I ought to be able to show you what we got by to-night."

"Good enough!" cried Dr. Bird. "Go ahead while I try to calm down the bank officials. Will you have everything ready by eight o'clock?"

"Easy, Doctor," replied Casey as he turned to the magnetic brake.

By eight o'clock quite a crowd had assembled in a private room at the Blackstone Hotel. Besides Dr. Bird and Carnes, Rogers and several other officials of the First National Bank were present, together with Detective-Captain Sturtevant and a group of the most prominent scientists and physicians gathered from the schools of the city.

"Gentlemen," said Dr. Bird when all had taken seats facing a miniature moving picture screen on one wall, "to-night I expect to show you some pictures which will, I am sure, astonish you. It marks the advent of a

new departure in transcendental medicine. I will be glad to answer any questions you may wish to ask and to explain the pictures after they are shown, but before we start a discussion, I will ask that you examine what I have to show you. Lights out, please!"

He stepped to the rear of the room as the lights went out. As his eyes grew used to the dimness of the room he moved forward and took a vacant seat. His hand fumbled in his pocket for a second.

"Now!" he cried suddenly.

In the momentary silence which followed his cry, two dull metallic clicks could be heard, and a quick cry that was suddenly strangled as Dr. Bird clamped his hand over the mouth of the man who sat between him and Carnes.

"All right, Casey," called the doctor.

The whir of a projection machine could be heard and on the screen before them leaped a picture of the paying teller's cage of the First National Bank.

Winston's successor was standing motionless at the wicket, his lips parted in a smile, but the attention of all was riveted on a figure who moved at the back of the cage. As the picture started, the figure was bent over an opened suitcase, stuffing into it bundles of bills. He straightened up and reached to the rack for more bills, and as he did so he faced the camera full for a moment. He picked up other bundles of bills, filled the suitcase, fastened it in a leisurely manner, opened the rear door of the cage and walked out.

"Again, please!" called Dr. Bird. "And stop when he faces us full."

The picture was repeated and stopped at the point indicated.

"Lights, please!" cried the doctor.

The lights flashed on and Dr. Bird rose to his feet, pulling up after him the wilted figure of a middle-aged man.

"Gentlemen," said the doctor in ringing tones, "allow

me to present to you Professor James Kirkwood of the faculty of the Richton University, formerly known as James Collier of the Bureau of Standards, and robber of the First National Bank."

Detective-Captain Sturtevant jumped to his feet and cast a searching glance at the captive.

"He's the man all right," he cried. "Hang on to him until I get a wagon here!"

"Oh, shut up!" said Carnes. "He's under federal arrest just now, charged with the possession of narcotics. When we are through with him, you can have him if you want him."

"How did you get that picture, Doctor?" cried the cashier. "I watched that cage every minute during the morning and I'll swear that man never entered and stole that money as the picture shows, unless he managed to make himself invisible."

IMAGE DESCRIPTION

"You're closer to the truth than you suspect, Mr. Rogers," said Dr. Bird. "It is not quite a matter of invisibility, but something pretty close to it. It is a matter of catalysts."

"What kind of cats?" asked the cashier.

"Not cats, Mr. Rogers, catalysts. Catalysts is the name of a chemical reaction consisting essentially of a decomposition and a new combination effected by means of a catalyst which acts on the compound bodies in question, but which goes through the reaction itself unchanged. There are a great many of them which are used in the arts and in manufacturing, and while their action is not always clearly understood, the results are well known and can be banked on.

"One of the commonest instances of the use of a catalyst is the use of sponge platinum in the manufacture of sulphuric acid. I will not burden you with the details of the 'contact' process, as it is known, but the combination is effected by means of finely divided platinum which is neither changed, consumed or wasted during the process. While there are a number of other catalysts known, for instance iron in reactions in which metallic magnesium is concerned, the commonest are the metals of the platinum group.

"Less is known of the action of catalysts in the organic reactions, but it has been the subject of intensive study by Dr. Knolles of the Bureau of Standards for several years. His studies of the effects of different colored lights, that is, rays of different wave-lengths, on the reactions which constitute growth in plants have had a great effect on hothouse forcing of plants and promise to revolutionize the truck gardening industry. He has speeded up the rate of growth to as high as ten times the normal rate in some cases.

"A few years ago, he and his assistant, James Collier, turned their attention toward discovering a catalyst which would do for the metabolic reactions in animal life what his light rays did for plants. What his method was, I will not disclose for obvious reasons, but suffice it to say that he met with great success. He took a puppy and by treating it with his catalytic drugs, made it grow to maturity, pass through its entire normal life span, and die of old age in six months."

"That is very interesting, Doctor, but I fail to see what bearing it has on the robbery."

"Mr. Rogers, how, on a dark day and in the absence of a timepiece, would you judge the passage of time?"

"Why, by my stomach, I guess."

"Exactly. By your metabolic rate. You eat a meal, it digests, you expend the energy which you have taken into your system, your stomach becomes empty and your system demands more energy. You are hungry and you judge that some five or six hours must have passed since you last ate. Do you follow?"

"Certainly."

"Let us suppose that by means of some tonic, some catalytic drug, your rate of metabolism and also your rate of expenditure of energy has been increased six fold. You would eat a meal and in one hour you would be hungry again. Having no timepiece, and assuming that you were in a light-proof room, you would judge that some five hours had passed, would you not?"

"I expect so."

"Very well. Now suppose that this accelerated rate of digestion and expenditure of energy continued. You would be sleepy in perhaps three hours, would sleep about an hour and a quarter, and would then wake, ready for your breakfast. In other words, you would have lived through a day in four hours."

"What advantage would there be in that?"

"None, from your standpoint. It would, however, increase the rate of reproduction of cattle greatly and might be a great boom to agriculture, but we will not discuss this phase now. Suppose it were possible to increase your rate of metabolism and expenditure of energy, in other words, your rate of living, not six times, but thirty thousand times. In such a case you would live five minutes in one one-hundredth of a second."

"Naturally, and you would live a year in about seventeen and one-half minutes, and a normal lifespan of seventy years in about twenty hours. You would be as badly off as any common may-fly."

"Agreed, but suppose that you could so regulate the dose of your catalyst that its effect would last for only one one-hundredth of a second. During that short period of time, you would be able to do the work that would ordinarily take you five minutes. In other words, you could enter a bank, pack a satchel with currency and walk out. You would be working in a leisurely manner, yet your actions would have been so quick that no human eye could have detected them. This is my theory of what actually took place. For verification, I will turn to Dr. Kirkwood, as he prefers to be known now."

"I don't know how you got that picture, but what you have said is about right," replied the prisoner.

"I got that picture by using a speed of thirty thousand times the normal sixteen exposures per second," replied Dr. Bird. "That figure I got from Dr. Knolles, the man who perfected the secret you stole when you left the Bureau three years ago. You secured only part of it and I suppose it took all your time since to perfect and complete it. You gave yourself away when you experimented on young Ladd. I was a track man

myself in my college days and when I saw an account of his running, I smelt a rat, so I came back and watched him. As soon as I saw him crush and swallow a capsule just as the gun was fired, I was sure, and got hold of him. He was pretty stubborn, but he finally told me what name you were running under now, and the rest was easy. I would have got you in time anyway, but your bravado in telling us when you would next operate gave me the idea of letting you do it and photographing you at work. That is all I have to say. Captain Sturtevant, you can take your prisoner whenever you want him."

"I reckoned without you, Dr. Bird, but the end hasn't come yet. You may send me up for a few years, but you'll never find that money. I'm sure of that."

"Tut, tut, Professor," laughed Carnes. "Your safety deposit box in the Commercial National is already sealed until a court orders it opened. The bills you took this morning were all marked, so that is merely additional proof, if we needed it. You surely didn't think that such a transparent device as changing your name from 'James Collier' to 'John Collyer' and

signing with your left hand instead of your right would fool the secret service, did you? Remember, your old Bureau records showed you to be ambidextrous."

"What about Winston's confession?" asked Rogers suddenly.

"Detective-Captain Sturtevant can explain that to a court when Mr. Winston brings suit against him for false arrest and brutal treatment," replied Carnes.

"A very interesting case, Carnes," remarked the doctor a few hours later. "It was an enjoyable interlude in the routine of most of the cases on which you consult me, but our play time is over. We'll have to get after that counterfeiting case to-morrow."

March 1930

#15 Cold Light, by Sterner St. Paul Meek:

How could a human body be found actually splintered--broken into sharp fragments like a shattered glass! Once again Dr. Bird probes deep into an amazing mystery.

Aproximate word count: 7,000

Bigotry:

Warnings:

- - -

“Confound it, Carnes, I am on my vacation!”

“I know it, Doctor, and I hate to disturb you, but I felt that I simply had to. I have one of the weirdest cases on my hands that I have ever been mixed up in and I think that you’ll forgive me for calling you when I tell you about it.”

How could a human body be found actually splintered--broken into sharp fragments like a

shattered glass! Once again Dr. Bird probes deep into an amazing mystery.

Dr. Bird groaned into the telephone transmitter.

“I took a vacation last summer, or tried to, and you hauled me away from the best fishing I have found in years to help you on a case. This year I traveled all the way from Washington to San Francisco to get away from you and the very day that I get here you are after me. I won’t have anything to do with it. Where are you, anyway?”

“I am at Fallon, Nevada, Doctor. I’m sorry that you won’t help me out because the case promises to be unusually interesting. Let me at least tell you about it.”

Dr. Bird groaned louder than ever into the telephone transmitter.

“All right, go ahead and tell me about it if it will relieve your mind, but I have given you my final answer. I am not a bit interested in it.”

“That is quite all right, Doctor, I 296 don’t expect you to touch it. I hope, however, that you will be able to give me an idea of where to start. Did you ever see a man’s body broken in pieces?”

“Do you mean badly smashed up?”

“No indeed, I mean just what I said, broken in pieces. Legs snapped off as though the entire flesh had become brittle.”

“No, I didn’t, and neither did anyone else.”

“I have seen it, Doctor.”

“Hooey! What had you been drinking?”

Operative Carnes of the United States Secret Service chuckled softly to himself. The voice of the famous scientist of the Bureau of Standards plainly showed an interest which was quite at variance with his words.

“I was quite sober, Doctor, and so was Hughes, and

we both saw it.”

“Who is Hughes?”

“He is an air mail pilot, one of the crack fliers of the Transcontinental Airmail Corporation. Let me tell you the whole thing in order.”

“All right. I have a few minutes to spare, but I’ll warn you again that I don’t intend to touch the case.”

“Suit yourself, Doctor. I have no authority to requisition your services. As you know, the T.A.C. has been handling a great deal of the transcontinental air mail with a pretty clean record on accidents. The day before yesterday, a special plane left Washington to carry two packages from there to San Francisco. One of them was a shipment of jewels valued at a quarter of a million, consigned to a San Francisco firm and the other was a sealed packet from the War Department. No one was supposed to know the contents of that packet except the Chief of Staff who delivered it to the plane personally, but rumors got out, as usual, and it was popularly supposed to

contain certain essential features of the Army's war plans. This much is certain: The plane carried not only the regular T.A.C. pilot and courier, but also an army courier, and it was guarded during the trip by an army plane armed with small bombs and a machine-gun. I rode in it. My orders were simply to guard the ship until it landed at Mills Field and then to guard the courier from there to the Presidio of San Francisco until his packet was delivered personally into the hands of the Commanding General of the Ninth Corps Area.

"The trip was quiet and monotonous until after we left Salt Lake City at dawn this morning. Nothing happened until we were about a hundred miles east of Reno. We had taken elevation to cross the Stillwater Mountains and were skimming low over them, my plane trailing the T.A.C. plane by about half a mile. I was not paying any particular attention to the other ship when I suddenly felt our plane leap ahead. It was a fast Douglas and the pilot gave it the gun and made it move, I can tell you. I yelled into the speaking tube and asked what was the reason. My pilot yelled back

that the plane ahead was in trouble.

“As soon as it was called to my attention I could see myself that it wasn’t acting normally. It was losing elevation and was pursuing a very erratic course. Before we could reach it it lost flying speed and fell into a spinning nose dive and headed for the ground. I watched, expecting every minute to see the crew make parachute jumps, but they didn’t and the plane hit the ground with a terrific crash.”

“It caught fire, of course?”

“No, Doctor, that is one of the funny things about the accident. It didn’t. It hit the ground in an open place free from brush and literally burst into pieces, but it didn’t flame up. We headed directly for the scene of the crash and we encountered another funny thing. We almost froze to death.”

“What do you mean?”

“Exactly what I say. Of course, it’s 297 pretty cold at that altitude all the time, but this cold was like

nothing I had ever encountered. It seemed to freeze the blood in our veins and it congealed frost on the windshields and made the motor miss for a moment. It was only momentary and it only existed directly over the wrecked plane. We went past it and swung around in a circle and came back over the wreck, but we didn't feel the cold again.

“The next thing we tried to do was to find a landing place. That country is pretty rugged and rough and there wasn't a flat place for miles that was large enough to land a ship on. Hughes and I talked it over and there didn't seem to be much of anything that we could do except to go on until we found a landing place. I had had no experience in parachute jumping and I couldn't pilot the plane if Hughes jumped. We swooped down over the wreck as close as we dared and that was when we saw the condition of the bodies. The whole plane was cracked up pretty badly, but the weird part of it was the fact that the bodies of the crew had broken into pieces, as though they had been made of glass.

IMAGEDescription

Arms and legs were detached from the torsos and lying at a distance. There was no sign of blood on the ground. We saw all this with our naked eyes from close at hand and verified it by observations through binoculars from a greater height.

“When we had made our observations and marked the location of the wreck as closely as we could, we

headed east until we found a landing place near Fallon. Hughes dropped me here and went on to Reno, or to San Francisco if necessary, to report the accident and get more planes to aid in the search. I was wholly at sea, but it seemed to be in your line and as I knew that you were at the St. Francis, I called you up.”

“What are your plans?”

“I made none until I talked with you. The country where the wreck occurred is unbelievably wild and we can’t get near it with any transportation other than burros. The only thing that I can see to do is to gather together what transportation I can and head for the wreck on foot to rescue the packets and to bring out the bodies. Can you suggest anything better?”

“When do you expect to start?”

“As soon as I can get my pack train together. Possibly in three or four hours.”

“Carnes, are you sure that those bodies were broken into bits? An arm or a leg might easily be torn off in a complete crash.”

“They were smashed into bits as nearly as I could tell, Doctor. Hughes is an old flier and he has seen plenty of crashes but he never saw anything like this. It beats anything that I ever saw.”

“If your observations were accurate, there could be only one cause and that one is a patent impossibility. I haven’t a bit of equipment here, but I expect that I can get most of the stuff I want from the University of California across the bay at Berkeley. I can get a plane at Crissy Field. I’ll tell you what to do, Carnes. Get your burro train together and start as soon as you can, but leave me half a dozen burros and a guide at Fallon. I’ll get up there as soon as I can and I’ll try to overtake you before you get to the wreck. If I don’t, don’t disturb anything any more than you can help until my arrival. Do you understand?”

“I thought that you were on your vacation, Doctor.”

“Oh shut up! Like most of my vacations, this one will have to be postponed. I’ll move as swiftly as I can and I ought to be at Fallon to-night if I’m lucky and don’t run into any obstacles. Burros are fairly slow, but I’ll make the best time possible.”

“I rather expected you would, Doctor. I can’t get my pack train together until evening, so I’ll wait for you right here. I’m mighty glad that you are going to get in on it.”

298

Silently Carnes and Dr. Bird surveyed the wreck of the T.A.C. plane. The observations of the secret service operative had been correct. The bodies of the unfortunate crew had been broken into fragments. Their limbs had not been twisted off as a freak of the fall but had been cleanly broken off, as though the bodies had suddenly become brittle and had shattered on their impact with the ground. Not only the bodies, but the ship itself had been broken up. Even the clothing of the men was in pieces or had long splits in the fabric whose edges were as clean as though they

had been cut with a knife.

Dr. Bird picked up an arm which had belonged to the pilot and examined it. The brittleness, if it had ever existed, was gone and the arm was limp.

“No *rigor mortis*,” commented the Doctor. “How long ago was the wreck?”

“About seventy-two hours ago.”

“Hm-m! What about those packets that were on the plane?”

Carnes stepped forward and gingerly inspected first the body of the army courier and then that of the courier of the T.A.C.

“Both gone, Doctor,” he reported, straightening up.

Dr. Bird’s face fell into grim lines.

“There is more to this case than appears on the surface, Carnes,” he said. “This was no ordinary

wreck. Bring up that third burro; I want to examine these fragments a little. Bill," he went on to one of the two guides who had accompanied them from Fallon, "you and Walter scout around the ground and see what you can find out. I especially wish to know whether anyone has visited the scene of the wreck."

The guides consulted a moment and started out. Carnes drove up the burro the Doctor had indicated and Dr. Bird unpacked it. He opened a mahogany case and took from it a high powered microscope. Setting the instrument up on a convenient rock, he subjected portions of the wreck, including several fragments of flesh, to a careful scrutiny. When he had completed his observations he fell into a brown study, from which he was aroused by Carnes.

"What did you find out about the cause of the wreck, Doctor?"

"I don't know what to think. The immediate cause was that everything was frozen. The plane ran into a belt of cold which froze up the motor and which probably killed the crew instantly. It was undoubtedly the

aftermath of that cold which you felt when you swooped down over the wreck.”

“It seems impossible that it could have suddenly got cold enough to freeze everything up like that.”

“It does, and yet I am confident that that is what happened. It was no ordinary cold, Carnes; it was cold of the type that infests interstellar space; cold beyond any conception you have of cold, cold near the range of the absolute zero of temperature, nearly four hundred and fifty degrees below zero on the Fahrenheit scale. At such temperatures, things which are ordinarily quite flexible and elastic, such as rubber, or flesh, become as brittle as glass and would break in the manner which these bodies have broken. An examination of the tissues of the flesh shows that it has been submitted to some temperature that is very low in the scale, probably below that of liquid air. Such a temperature would produce instant death and the other phenomena which we can observe.”

“What could cause such a low temperature, Doctor?”

“I don’t know yet, although I hope to find out before we are finished. Cold is a funny thing, Carnes. Ordinarily it is considered as simply the absence of heat; and yet I have always held it to be a definite negative quantity. All through nature we observe that every force has its opposite or negative force to oppose it. We have positive and negative electrical charges, positive and negative, or north and south, magnetic poles. We have gravity and its opposite apery, and I believe cold is really negative heat.”

“I never heard of anything like that, Doctor. I always thought that things were cold because heat was taken from them--not because cold was added. It sounds preposterous.”

“Such is the common idea, and yet I cannot accept it, for it does not explain all the recorded phenomena. You are familiar with a searchlight, are you not?”

“In a general way, yes.”

“A searchlight is merely a source of light, and of course, of heat, which is placed at the focus of a

parabolic reflector so that all of the rays emanating from the source travel in parallel lines. A searchlight, of course, gives off heat. If we place a lens of the same size as the searchlight aperture in the path of the beam and concentrate all the light, and heat, at one spot, the focal point of the lens, the temperature at that point is the same as the temperature of the source of the light, less what has been lost by radiation. You understand that, do you not?"

"Certainly."

"Suppose that we place at the center of the aperture of the searchlight a small opaque disc which is permeable neither to heat nor light, in such a manner as to interrupt the central portion of the beam. As a result, the beam will go out in the form of a hollow rod, or pipe, of heat and light with a dark, cold core. This core will have the temperature of the surrounding air plus the small amount which has radiated into it from the surrounding pipe. If we now pass this beam of light through a lens in order to concentrate the beam, both the pipe of heat and the cold core will focus. If we place a temperature

measuring device near the focus of the dark core, we will find that the temperature is lower than the surrounding air. This means that we have focused or concentrated cold.”

“That sounds impossible. But I can offer no other criticism.”

“Nevertheless, it is experimentally true. It is one of the facts which lead me to consider cold as negative heat. However, this is true of cold, as it is of the other negative forces; they exist and manifest themselves only in the presence of the positive forces. No one has yet concentrated cold except in the presence of heat, as I have outlined. How this cold belt which the T.A.C. plane encountered came to be there is another question. The thing which we have to determine is whether it was caused by natural or artificial forces.”

“Both of the packets which the plane carried are gone, Doctor,” observed Carnes.

“Yes, and that seems to add weight to the possibility that the cause was artificial, but it is far from

conclusive. The packets might not have been on the men when the plane fell, or someone may have passed later and taken them for safekeeping.”

The doctor’s remarks were interrupted by the guides.

“Someone has been here since the wreck, Doctor,” said Bill. “Walter and I found tracks where two men came up here and prowled around for some time and then left by the way they came. They went off toward the northwest, and we followed their trail for about forty rods and then lost it. We weren’t able to pick it up again.”

“Thanks, Bill,” replied the doctor. “Well, Carnes, that seems to add more weight to the theory that the spot of cold was made and didn’t just happen. If a prospecting party had just happened along they would either have left the wreck alone or would have made some attempt to enter the bodies. That cold belt must have been produced artificially by men who planned to rob this plane after bringing it down and who were near at hand to get their plunder. Is there any chance of following that trail?”

“I doubt it, Doc. Walter and I scouted around quite a little, but we couldn’t pick it up again.”

300

“Is there any power line passing within twenty miles of here?”

“None that Walter and I know of, Doc.”

“Funny! Such a device as must have been used would need power and lots of it for operation. Well, I’ll try my luck. Carnes, help me unpack and set up the rest of my apparatus.”

With the aid of the operative, Dr. Bird unpacked two of the burros and extracted from cases where they were carefully packed and padded some elaborate electrical and optical apparatus. The first was a short telescope of large diameter which he mounted on a base in such a manner that it could be elevated or depressed and rotated in any direction. At the focal point of the telescope was fastened a small knot of wire from which one lead ran to the main piece of

apparatus, which he sat on a flat rock. The other lead from the wire knot ran into a sealed container surrounded by a water bath under which a spirit lamp burned. From the container another lead led to the main apparatus. This main piece consisted of a series of wire coils mounted on a frame and attached to the two leads. The doctor took from a padded case a tiny magnet suspended on a piece of wire of exceedingly small diameter which he fastened in place inside the coils. Cemented to the magnet was a tiny mirror.

“What is that apparatus?” asked Carnes as the doctor finished his set-up and surveyed it with satisfaction.

“Merely a thermocouple attached to a D’Arsonval galvanometer,” replied the doctor. “This large, squat telescope catches and concentrates on the thermocouple and the galvanometer registers the temperature.”

“You’re out of my depth. What is a thermocouple?”

“A juncture of two wires made of dissimilar metals, in this case of platinum and of platinum-iridium alloy.

When the temperatures of the two junctions are the same, the system is in equilibrium. When they are at different temperatures, an electrical potential is set up, which causes a current to flow from one to the other through the galvanometer. The galvanometer consists of a magnet set up inside coils through which the current I flows. This current causes the magnet to rotate and by watching the mirror, the rotation can be detected and measured.

“What are you going to use it for?”

“I am going to try to locate somewhere in these hills a

patch of local cold. It may not work, but I have hopes. If you will manipulate the telescope so as to search the hills around here, I will watch the galvanometer."

For several minutes Carnes swung the telescope around. Twice Dr. Bird stopped him and decreased the sensitiveness of his instrument by introducing more resistance in the lines in order to keep the magnet from twisting clear around, due to the fluctuations in the heats received on account of the varying conditions of reflection. As Carnes swung the telescope again the magnet swung around sharply, nearly to a right angle to its former position.

"Stop!" cried the doctor. "Read your azimuth."

Carnes read the compass bearing on the protractor attached to the frame which supported the telescope. Dr. Bird took a pair of binoculars and looked long and earnestly in the indicated direction. With a sigh he laid down the glasses.

“I can’t see a thing, Carnesy,” he said. “We’ll have to move over to the next crest and make a new set-up. Plant a rod on the hill so that we can get an azimuth bearing and get the airline distance with a range finder.”

On the hilltop which Dr. Bird had pointed out the apparatus was again set up. For several minutes Carnes swept the hills before an exclamation from the doctor told him to pause. He read the new azimuth, and the doctor laid off the two readings on a sheet of paper with a protractor and made a few calculations.

“I don’t know,” he said reflectively when he had finished his computations. “This darned instrument is still so sensitive that you may have merely focused on a deep shadow or a cold spring or something of that sort, but the magnet kicked clear around and it may mean that we have located what we are looking for. It should be about two miles away and almost due west of here.”

“There is no spring that I know of, Doc, and I think I know of every water hole in this country,” remarked

Bill.

“There could hardly be a spring at this elevation, anyway,” replied the doctor. “Maybe it is what we are seeking. We’ll start out in that direction, anyway. Bill, you had better take the lead, for you know the country. Spread out a little so that we won’t be too bunched if anything happens.”

For three-quarters of an hour the little group of men made their way through the wilderness in the direction indicated by the doctor. Presently Bill, who was in the lead, held up his hand with a warning gesture. The other three closed up as rapidly as cautious progress would allow.

“What is it, Bill?” asked the doctor in an undertone.

“Slip up ahead and look over that crest.”

The doctor obeyed instructions. As he glanced over he gave vent to a low whistle of surprise and motioned for Carnes to join him. The operative crawled up and glanced over the crest. In a hollow before them was a

crude one-storied house, and erected on an open space before it was a massive piece of apparatus. It consisted of a number of huge metallic cylinders, from which lines ran to a silvery concave mirror mounted on an elaborate frame which would allow it to be rotated so as to point in any direction.

“What is it?” whispered Carnes.

“Some kind of a projector,” muttered the doctor. “I never saw one quite like it, but it is meant to project something. I can’t make out the curve of that mirror. It isn’t a parabola and it isn’t an ellipse. It must be a high degree subcatenary or else built on a transcendental function.”

He raised himself to get a clearer view, and as he did so a puff of smoke came from the house, to be followed in a moment by a sharp crack as a bullet flattened itself a few inches from his head. The doctor tumbled back over the crest out of sight of the house. Bill and Walter hurried forward, their rifles held ready for action.

“Get out on the flanks, men,” directed the doctor.

“The man we want is in a house in that hollow. He’s armed, and he means business.”

Bill and Walter crawled under the shelter of the rocks to a short distance away and then, rifles ready, advanced to the attack. A report came from the hollow and a bullet whined over Bill’s head. Almost instantly a crack came from Walter’s rifle and splinters flew from the building in the hollow a few inches from a loophole, through which projected the barrel of a rifle.

The rifle barrel swung rapidly in a circle and barked in Walter’s direction; but as it did so, Bill’s gun spoke and again splinters flew from the building.

“Good work!” ejaculated Dr. Bird as he watched the slow advance of the two guides. “If we just had rifles we could join in the party, but it’s a little far for effective pistol work. Let’s go ahead, and we may get close enough to do a little shooting.”

Pistols in hand, Carnes and the doctor crawled over

the crest and joined the advance. Again and again the rifle spoke from the hollow and was answered by the vicious barks of the rifles in the hands of the guides, Carnes and the doctor resting their pistols on rocks and sending an occasional bullet toward the loophole. The conditions of light and the moving target were not conducive to good marksmanship on the part of the besieged man, and none of the attackers were hit. Presently Walter succeeded in sending a bullet through the loophole. The rifle barrel suddenly disappeared. With a shout the four men rose from their cover and advanced toward the building at a run.

As they did so an ominous whirring sound came from the apparatus in front of the house and a sudden chill filled the air.

“Back!” shouted Dr. Bird. “Back below the hill if you value your lives!”

He turned and raced at full speed toward the sheltering crest of the hill, the others following him closely. The whirring sound continued, and the

concave reflector turned with a grating sound on its gears. As the path of its rays struck the ground the rocks became white with frost and one rock split with a sharp report, one fragment rolling down the slope, carrying others in its trail.

With panic-stricken faces the four men raced toward the sheltering crest, but remorselessly the reflector swung around in their direction. The intense cold numbed the racing men, cutting off their breath and impeding their efforts for speed.

“Stop!” cried the doctor suddenly. “Fire at that reflector! It’s our only chance!”

He set the example by turning and emptying his pistol futilely at the turning mirror. Bill, Walter and Carnes followed his example. Nearer and nearer to them came the deadly ray. Bill was the nearest to its path, and he suddenly stiffened and fell forward, his useless gun still grasped in his hands. As his body struck the ground it rolled down hill for a few feet, the deadly ray following it. His head struck a rock, and Carnes gave a cry of horror as it broke into fragments.

Walter threw his rifle to his shoulder and fired again and again at the rotating disc. The cold had become intense and he could not control the actions of his muscles and his rifle wavered about. He threw himself flat on the ground, and, with an almost superhuman effort, steadied himself for a moment and fired. His aim was true, and with a terrific crash the reflector split into a thousand fragments. Dr. Bird staggered to his feet.

“It’s out of order for a moment!” he cried. “To the house while we can!”

As swiftly as his numbed feet would allow him, he stumbled toward the house. The muzzle of the rifle again projected from the loophole and with its crack the doctor staggered for a moment and then fell. Walter’s rifle spoke again and the rifle disappeared through the loophole with a spasmodic jerk. Carnes stumbled over the doctor.

“Are you hit badly?” he gasped through chattering teeth.

“I’m not hit at all,” muttered the doctor. “I stumbled and fell just as he fired. Look out! He’s going to shoot again!”

The rifle barrel came slowly into view through the loophole. Walter fired, but his bullet went wild. Carnes threw himself behind a rock for protection.

The rifle swung in Walter’s direction and paused. As it did so, from the house came a strangled cry and a sound as of a blow. The rifle barrel disappeared, and the sounds of a struggle came from the building.

“Come on!” cried Carnes as he rose to his feet, and made his stumbling way forward, the others following at the best speed which their numbed limbs would allow.

As they reached the door they were aware of a struggle which was going on inside. With an oath the doctor threw his massive frame against the door. It creaked, but the solid oak of which it was composed was proof against the attack, and he drew back for another onslaught. From the house came a pistol

shot, followed by a despairing cry and a guttural shout. Reinforced by Carnes, the doctor threw his weight against the door again. With a rending crash it gave, and they fell sprawling into the cabin. The doctor was the first one on his feet.

“Who are you?” asked a voice from one corner. The doctor whirled like a flash and covered the speaker with his pistol.

“Put them up!” he said tersely.

“I am unarmed,” the voice replied. “Who are you?”

“We’re from the United States Secret Service,” replied Carnes who had gained his feet. “The game is up for you, and you’d better realize it.”

“Secret Service! Thank God!” cried the voice. “Get Koskoff—he has the plans. He has gone out through the tunnel!”

“Where is it?” demanded Carnes.

“The entrance is that iron plate on the floor.”

Carnes and the doctor jumped at the plate and tried to lift it, without result. There was no handle or projection on which they could take hold.

“Not that way,” cried the voice. “That cover is fastened on the inside. Go outside the building; he’ll come out about two hundred yards north. Shoot him as he appears or he’ll get away.”

The three men nearly tumbled over each other to get through the doorway into the bitter cold outside. As they emerged from the cabin the gaze of the guide swept the surrounding hills.

“There he goes!” he cried.

“Get him!” said Carnes sharply.

Walter ran forward a few feet and dropped prone on the ground, cuddling the stock of his rifle to his cheek. Two hundred yards ahead a figure was scurrying over the rocks away from the cabin. Walter

drew in his breath and his hand suddenly grew steady as his keen gray eyes peered through the sights. Carnes and the doctor held their breath in sympathy.

Suddenly the rifle spoke, and the fleeing man threw up his arms and fell forward on his face.

“Got him,” said Walter laconically.

“Go bring the body in, Carnes,” exclaimed the doctor. “I’ll take care of the chap inside.”

“Did you get him?” asked the voice eagerly, as the doctor stepped inside.

“He’s dead all right,” replied the doctor grimly. “Who the devil are you, and what are you doing here?”

“There is a light switch on the left of the door as you come in,” was the reply.

Dr. Bird found the switch and snapped on a light. He turned toward the corner from whence the voice had come and recoiled in horror. Propped in the corner

was the body of a middle-aged man, daubed and splashed with blood which ran from a wound in the side of his head.

“Good Lord!” he ejaculated. “Let me help you.”

“There’s not much use,” replied the man rather faintly. “I am about done in. This face wound doesn’t amount to much, but I am shot through the body and am bleeding internally. If you try to move me, it may easily kill me. Leave me alone until your partners come.”

The doctor drew a flask of brandy from his pocket and advanced toward the corner.

“Take a few drops of this,” he advised.

With an effort the man lifted the flask to his lips and gulped down a little of the fiery spirit. A sound of tramping feet came from the outside and then a thud as though a body had been dropped. Carnes and Walter entered the cabin.

“He’s dead as a mackerel,” said Carnes in answer to the doctor’s look. “Walter got him through the neck and broke his spinal cord. He never knew what hit him.”

“The plans?” came in a gasping voice from the man in the corner.

“We got them, too,” replied Carnes. “He had both packets inside his coat. They have been opened, but I guess they are all here. Who the devil are you?”

“Since Koskoff is dead, and I am dying, there is no reason why I shouldn’t tell you,” was the answer.

“Leave that brandy handy to keep up my strength. I have only a short time and I can’t repeat.

“As to who I am or what I was, it doesn’t really matter. Koskoff knew me as John Smith, and it will pass as well as any other name. Let my past stay buried. I am, or was, a scientist of some ability; but fortune frowned on me, and I was driven out of the world. Money would rehabilitate me--money will do anything nowadays--so I set out to get it. In the

course of my experimental work, I had discovered that cold was negative heat and reacted to the laws which governed heat.”

“I knew that,” cried Dr. Bird; “but I never could prove it.”

“Who are you?” demanded John Smith.

“Dr. Bird, of the Bureau of Standards.”

“Oh, Bird. I’ve heard of you. You can understand me when I say that as heat, positive heat is a concomitant of ordinary light. I have found that cold, negative heat, is a concomitant of cold light. Is my apparatus in good shape outside?”

“The reflector is smashed.”

“I’m sorry. You would have enjoyed studying it. I presume that you saw that it was a catenary curve?”

“I rather thought so.”

“It was, and it was also adjustable. I could vary the focal point from a few feet to several miles. With that apparatus I could throw a beam of negative heat with a focal point which I could adjust at will. Close to the apparatus, I could obtain a temperature almost down to absolute zero, but at the longer ranges it wasn’t so cold, due to leakage into the atmosphere. Even at two miles I could produce a local temperature of three hundred degrees below zero.”

“What was the source of your cold?”

“Liquid helium. Those cylinders contain, or rather did contain, for I expect that Koskoff has emptied them, helium in a liquid state.”

“Where is your compressor?”

“I didn’t have to use one. I developed a cold light under whose rays helium would liquefy and remain in a state of equilibrium until exposed to light rays. Those cylinders had merely enough pressure to force the liquid out to where the sun could hit it, and then it turned to a gas, dropping the temperature at the first

focal point of the reflector to absolute zero. When I had this much done, Koskoff and I packed the whole apparatus here and were ready for work.

“We were on the path of the transcontinental air mail, and I bided my time until an especially valuable shipment was to be made. My plans, which worked perfectly, were to freeze the plane in midair and then rob the wreck. I heard of the jewel shipment the T.A.C. was to carry and I planned to get it. When the plane came over, Koskoff and I brought it down. The unsuspected presence of another plane upset us a little, and I started to bring it down. But we had been all over this country and knew there was no place that a plane could land. I let it go on in safety.”

“Thank you,” replied Carnes with a grimace.

“We robbed the wreck and we found two packets, one the jewels I was after, 305 and the other a sealed packet, which proved to contain certain War Department plans. That was when I learned who Koskoff was. I had hired him in San Francisco as a good mechanic who had no principles. He was to get

one-fourth of the loot. When we found these plans, he told me who he was. He was really a Russian secret agent and he wanted to deliver the plans to Russia. I may be a thief and a murderer, but I am not yet ready to betray my country, and I told him so. He offered me almost any price for the plans; but I wouldn't listen. We had a serious quarrel, and he overpowered me and bound me.

"We had a radio set here and he called San Francisco and sent some code message. I think he was waiting here for someone to come. Had we followed our original plans, we would have been miles from here before you arrived.

"He had me bound and helpless, as he thought, but I worked my bonds a little loose. I didn't let him know it, for I knew that the plane I had let get away would guide a party here and I thought I might be able to help out. When you came and attacked the house, I worked at my bonds until they were loose enough to throw off. I saw Koskoff start my cold apparatus to working and then he quit, because he ran out of helium. When he started shooting again, I worked out

of my bonds and tackled him.

“He was a better man than I gave him credit for, or else he suspected me, for about the time I grabbed him he whirled and struck me over the head with his gun barrel and tore my face open. The blow stunned me, and when I came to, I was thrown into this corner. I meant to have another try at it, but I guess you rushed him too fast. He turned and ran for the tunnel, but as he did so, he shot me through the body. I guess I didn’t look dead enough to suit him. You gentlemen broke open the door and came in. That’s all.”

“Not by a long shot, it isn’t,” exclaimed Dr. Bird.
“Where is that cold light apparatus of yours?”

“In the tunnel.”

“How do you get into it?”

“If you will open that cupboard on the wall, you’ll find an open knife switch on the wall. Close it.”

Dr. Bird found the switch and closed it. As he did so the cabin rocked on its foundations and both Carnes and Walter were thrown to the ground. The thud of a detonation deep in the earth came to their ears.

“What was that?” cried the doctor.

“That,” replied Smith with a wan smile, “was the detonation of two hundred pounds of T.N.T. When you dig down into the underground cave where we used the cold light apparatus, you will find it in fragments. It was my only child, and I’ll take it with me.”

As he finished his head slumped forward on his chest. With an exclamation of dismay Dr. Bird sprang forward and tried to lift the prostrate form.

In an agony of desire the Doctor tightened his grip on the dying man’s shoulder. But Smith collapsed into a heap. Dr. Bird bent forward and tore open his shirt and listened at his chest. Presently he straightened up.

“He is gone,” he said sadly, “and I guess the results of

his genius have died with him. He doesn't strike me as a man who left overmuch to chance. Carnes, is your case completed?"

"Very satisfactorily, Doctor. I have both of the lost packets."

"All right, then, come back to the wreck and help me pack my burros. I can make my way back to Fallon without a guide."

"Where are you going, Doctor?"

"That, Carnes, old dear, is none of your blankety blanked business. Permit me to remind you that I am on my vacation. I haven't decided yet just where I am going, but I can tell you one thing. It's going to be some place where you can't call me on the telephone."

#16 Brigands of the Moon, by Ray Cummings:

Black mutiny and brigandage stalk the space-ship Planetara as she speeds to the moon to pick up a fabulously rich cache of radium-ore.

Aproximate word count: 77,300

Bigotry:

Warnings:

Foreword by Ray Cummings:

I have been thinking that if, during one of those long winter evenings at Valley Forge, someone had placed in George Washington's hands one of our present day best sellers, the illustrious Father of our Country would have read it with considerable emotion. I do not mean what we call a story of science, or fantasy--just a novel of action, adventure and romance. The sort of thing you and I like to read, but do not find amazing in any way at all.

Black mutiny and brigandage stalk the Space-ship Planetara as she speeds to the Moon to pick up a fabulously rich cache of radium-ore.

But I fancy that George Washington would have found it amazing. Don't you? It might picture, for instance, a factory girl at a sewing machine. George Washington would be amazed at a sewing machine. And the girl, journeying in the subway to and from her work! Stealing an opportunity to telephone her lover at the noon hour; going to the movies in the evening, or

listening to a radio. And there might be a climax, perhaps, with the girl and the villain in a transcontinental railway Pullman, and the hero sending frantic telegrams, or telephoning the train, and then chasing it in his airplane.

George Washington would have found it amazing!

And I am wondering how you and I would feel if someone were to give us now a book of ordinary adventure of the sort which will be published a hundred and fifty years hence. I have been trying to imagine such a book and the nature of its contents.

IMAGEDescription

Let us imagine it together. Suppose we walk down Fifth Avenue, a pleasant spring morning of May, 2080. Fifth Avenue, no doubt, will be there. I don't know whether the New York Public Library will be there or

not. We'll assume that it is, and that it has some sort of books, printed, or in whatever fashion you care to imagine.

The young man library attendant is surprised at our curiously antiquated aspect. We look as though we were dressed for some historical costume ball. We talk old-fashioned English, like actors in an historical play of the 1930 period.

But we get the book. The attendant assures us it is a good average story of action and adventure. Nothing remarkable, but he read it himself, and found it interesting.

We thank him and take the book. But we find that the language in which it is written is too strange for comfortable reading. And it names so many extraordinary things so casually! As though we knew all about them, which we certainly do not!

So we take it to the kind-hearted librarian in the language division. He modifies it to old-fashioned English of 1930, and he puts occasional footnotes to

help explain some of the things we might not understand. Why he should bother to do this for us I don't know; but let us assume that he does.

And now we take the book home--in the pneumatic tube, or aerial moving sidewalk, or airship, or whatever it is we take to get home.

And now that we are home, let's read the book. It ought to be interesting.

Chapter 1 Tells of the Grantline Moon Expedition and of the Mysterious Martian Who Followed Us in the City Corridor

One may write about oneself and still not be an egoist. Or so, at least, they tell me. My narrative went broadcast with a fair success. It was pantomimed and the public flashed me a reasonable approval. And so my disc publishers have suggested that I record it in more permanent form.

I introduce myself, begging grace that I intrude upon your busy minutes, with my only excuse that perhaps I may amuse you. For what the commercial sellers of my pictured version were pleased to blare as my handsome face, I ask your indulgence. My feminine audience of the pantomimes was undoubtedly graciously pleased at my personality and physical aspect. That I am “tall as a Viking of old”—and “handsome as a young Norse God”—is very pretty talk in the selling of my product. But I deplore its intrusion into the personality of this, my recorded narrative. And so now, for preface, to all my audience

I do give earnest assurance that Gregg Haljan is no conceited zebra, handsomely striped by nature, and proud of it. Not so. I am, I do beg you to believe, a very humble fellow, striving for your approval, hoping only to entertain you.

My introduction: My name, Gregg Haljan. My age, twenty-five years. I was, at the time my narrative begins, Third Officer on the Space-Ship Planetara. Our line was newly established; in 2070, to be exact, following the modern improvements of the Martel Magnetic Levitation. [As early as 1910 it was discovered that an object magnetized under certain conditions was subject to a loss of weight, its gravity partially nullified. The Martel discovery undoubtedly followed that method.]

Our ship, whose home port was Great-New York, carried mail and passenger traffic to and from both Venus and Mars. Of astronomical necessity, our flights were irregular. This spring, with the two other planets both close to the earth, we were making two complete round trips. We had just arrived in Great-New York, this May evening, from Grebhar, Venus Free State.

With only five hours in port here, we were departing the same night at the zero hour for Ferrok-Shahn, capital of the Martian Union.

We were no sooner at the landing stage than I found a code-flash summoning Dan Dean and me to Divisional Detective Headquarters. Dan “Snap” Dean was one of my closest friends. He was radio-helio operator of the Planetara. A small, wiry, red-headed chap, with a quick, ready laugh and a wit that made everyone like him.

The summons to Detective-Colonel Halsey’s office surprised us. Snap eyed me.

“You haven’t been opening any treasury vaults, have you, Gregg?”

“He wants you, also,” I retorted.

He laughed. “Well, he can roar at me like a traffic switchman and my private life will remain my own.”

We could not think why we should be wanted. It was

the darkness of mid-evening when we left the Planetara for Halsey's office. It was not a long trip. We went direct in the upper monorail, descending into the subterranean city at Park-Circle 30.

We had never been to Halsey's office before. We found it to be a gloomy, vaultlike place in one of the deepest corridors. The door lifted.

"Gregg Haljan and Daniel Dean."

The guard stood aside. "Come in."

I own that my heart was unduly thumping as we entered. The door dropped behind us. It was a small blue-lit apartment--a steel-lined room like a vault.

Colonel Halsey sat at his desk. And the big, heavy-set, florid Captain Carter--our commander of the Planetara--was here. That surprised us: we had not seen him leave the ship.

Halsey smiled at us gravely. Captain Carter said, "Sit down, lads."

We took the seats. There was an alarming solemnity about this. If I had been guilty of anything that I could think of, it would have been frightening. But Halsey's first words reassured me.

"It's about the Grantline Moon Expedition. In spite of our secrecy, the news has gotten out. We want to know how. Can you tell us?"

Captain Carter's huge bulk--he was about as tall as I am--towered over us as we sat before Halsey's desk. "If you lads have told anyone--said anything--let slip the slightest hint about it--"

Snap smiled with relief; but he turned solemn at once. "I haven't. Not a word!"

"Nor have I," I declared.

The Grantline Moon Expedition! We had not thought of that as a reason for this summons. Johnny Grantline was a close friend to us both. He had organized an exploring expedition to the Moon. Uninhabited, with its bleak, forbidding, airless,

waterless surface, the Moon--even though so close to the Earth--was seldom visited. No regular ship ever stopped there. A few exploring parties of recent years had come to grief.

But there was a persistent rumor that upon the Moon, mineral riches of fabulous wealth were awaiting discovery. The thing had already caused some interplanetary complications. The aggressive Martians would be only too glad to explore the Moon. But the U.S.W. ["United States of the World," which came into being in 2057 upon the centenary of the Yellow War.] definitely warned them away. The Moon was World Territory, we announced, and we would protect it as such.

The threatened conflict between the Earth and Mars had come to nothing. There was, this year of 2079, a thorough amity between all three of the inhabited planets. It still holds, and I pray that it may always hold.

There was, nevertheless, a realization by our government, that whatever riches might be upon the

Moon should be seized at once and held by some reputable Earth Company. And when Johnny Grantline applied, with his father's wealth and his own scientific record of attainment, the government was only too glad to grant him its writ.

The Grantline Expedition had started six months ago. The Martian government had acquiesced in our ultimatum, yet brigands have been known to be financed under cover of a governmental disavowal. And so the expedition was kept secret.

My words need give no offense to any Martian who comes upon them. I refer to the history of our earth only. The Grantline Expedition was on the Moon now. No word had come from it. One could not flash helios even in code without letting all the universe know that explorers were on the Moon. And why they were there, anyone could easily guess.

And now Colonel Halsey was telling us that the news was abroad! Captain Carter eyed us closely; his flashing eyes under the white bushy brows would pry a secret from anyone.

“You’re sure? A girl of Venus, perhaps, with her cursed, seductive lure! A chance word, with you lads befuddled by alcolite?”

We assured him we had been careful. By the heavens, I know that I had been. Not a whisper, even to Snap, of the name Grantline in six months or more.

Captain Carter added abruptly, “We’re insulated here, Halsey?”

“Yes, talk as freely as you like. An eavesdropping ray will never get into these walls.”

They questioned us. They were satisfied at last that, though the secret had escaped, we had not done it. Hearing it discussed, it occurred to me to wonder why Carter was concerned. I was not aware that he knew of Grantline’s venture. I learned now the reason why the Planetara, upon each of her voyages, had managed to pass fairly close to the Moon. It had been arranged with Grantline that if he wanted help or had any important message, he was to flash it locally to our passing ship. And this Snap knew, and had never

mentioned it, even to me.

Halsey was saying, "Well, we can't blame you, but the secret is out."

Snap and I regarded each other. What could anyone do? What would anyone dare do?

Captain Carter said abruptly, "Look here, lads, this is my chance now to talk plainly to you. Outside, anywhere outside these walls, an eavesdropping ray may be upon us. You know that? One may never even dare whisper since that accursed ray was developed."

Snap opened his mouth to speak but decided against it. My heart was pounding.

Captain Carter went on, "I know I can trust you two more than anyone else under me on the Planetara--"

"What do you mean by that?" I demanded. "What--"

He interrupted me. "Nothing at all but what I say."

Halsey smiled grimly. "What he means, Haljan, is that things are not always what they seem these days. One cannot always tell a friend from an enemy. The Planetara is a public vessel. You have--how many is it, Carter?--thirty or forty passengers this trip to-night?"

"Thirty-eight," said Carter.

"There are thirty-eight people listed for the flight to Ferrok-Shahn to-night," Halsey said slowly. "And some may not be what they seem." He raised his thin dark hand. "We have information--" He paused. "I confess, we know almost nothing--hardly more than enough to alarm us."

Captain Carter interjected, "I want you and Dean to be on your guard. Once on the Planetara it is difficult for us to talk openly, but be watchful. I will arrange for us to be doubly armed."

Vague, perturbing words! Halsey said, "They tell me George Prince is listed for the voyage. I am suggesting, Haljan, that you keep your eye especially upon him. Your duties on the Planetara leave you

comparatively free, don't they?"

"Yes," I agreed. With the first and second officers on duty, and the captain aboard, my routine was more or less that of an understudy.

I said, "George Prince! Who is he?"

"A mechanical engineer," said Halsey. "An under-official of the Earth Federated Radium Corporation. But he associates with bad companions--particularly Martians."

I had never heard of this George Prince, though I was familiar with the Federated Radium Corporation, of course. A semi-government trust, which controlled virtually the entire Earth supply of radium.

"He was in the Automotive Department," Carter put in. "You've heard of the Federated Radium Motor?"

We had, of course. A recent Earth invention which promised to revolutionize the automotive industry. An engine of a new type, using radium as its fuel.

Snap demanded, "What in the stars has this got to do with Johnny Grantline?"

"Much," said Halsey quietly, "or perhaps nothing. But George Prince some years ago mixed in rather unethical transactions. We had him in custody once. He is known now as unusually friendly with several Martians in New York of bad reputation."

"Well--" began Snap.

"What you don't know," Halsey went on quietly, "is that Grantline expects to find radium on the Moon."

We gasped.

"Exactly," said Halsey. "The ill-fated Ballon Expedition thought they had found it on the Moon some years ago. A new type of ore, as rich in radium as our gold-bearing sands are rich in gold. Ballon's first samples gave uranium atoms with a fair representation of ionium and thorium. A richly radio-active ore. A lode of the pure radium is there somewhere, without doubt."

He added vehemently, "Do you understand now why we should be suspicious of this George Prince? He has a criminal record. He has a thorough technical knowledge of radium ores. He associates with Martians of bad reputation. A large Martian Company has recently developed a radium engine to compete with our Earth motor. You know that? You know that there is very little radium available on Mars, and our government will not allow our own radium supply to be exported. That Martian Company needs radium. It will do anything to get radium. What do you suppose it would pay for a few tons of really rich radio-active ore--such as Grantline may have found on the Moon?"

"But," I objected, "that is a reputable Martian company. It's backed by the government of the Martian Union. The government of Mars would not dare--"

"Of course not!" Captain Carter exclaimed sardonically. "Not openly! But if Martian brigands had a supply of radium--I don't imagine where it came from would make much difference. That Martian Company would buy it."

Halsey added, "And George Prince, my agents inform me, seems to know that Grantline is on the Moon. Put it all together, lads. Little sparks show the hidden current.

"More than that: George Prince knows that we have arranged to have the Planetara stop at the Moon and bring back Grantline's radium-ore. This is your last voyage this year. You'll hear from Grantline this time, we're convinced. He'll probably give you the signal as you pass the Moon on your way out. Coming back, you'll stop at the Moon and transport whatever radium-ore Grantline has ready. The Grantline Flyer is too small for ore transportation."

Halsey's voice turned grimly sarcastic. "Doesn't it seem queer that George Prince and a few of his Martian friends happen to be listed as passengers for this voyage?"

In the silence that followed, Snap and I regarded each other. Halsey added abruptly,

"We had George Prince typed that time we arrested

him four years ago. I'll show him to you."

He snapped open an alcove, and said to his waiting attendant, "Get me the type of George Prince."

The disc in a moment came through the pneumatic. Halsey, smiling wryly, adjusted it.

"A nice looking fellow. Nicely spoken. Though at the time we made this he was somewhat annoyed, naturally. He is older now. Twenty-nine, to be exact. Here he is."

The image glowed on the grids before us. His name, George Prince, in letters illumined upon his forehead, showed for a moment and then faded. He stood smiling sourly before us as he repeated the official formula:

"My name is George Prince. I was born in Great-New York City twenty-five years ago."

I gazed at this life-size, moving image of George Prince. He stood somber in the black detention

uniform. A dark, almost a girlishly handsome fellow, well below medium height--the rod beside him showed five feet four inches. Slim and slight. Long, wavy black hair, falling about his ears. A pale, clean-cut, really handsome face, almost beardless. I regarded it closely. A face that would have been femininely beautiful without its masculine touch of heavy black brows and firmly set jaw. His voice as he spoke was low and soft; but at the end, with the concluding words, "I am innocent!" it flashed into strong masculinity. His eyes, shaded with long, girlish black lashes, by chance met mine. "I am innocent." His curving sensuous lips drew down into a grim sneer....

The type faded at its end. Halsey replaced the disc in its box and waved the attendant away. "Thank you."

He turned back to Snap and me. "Well, there he is. We have nothing tangible against him now. But I'll say this: he's a clever fellow, one to be afraid of. I would not blare it from the newscasters' microphone, but if he is hatching any plot, he has been too clever for my agents."

We talked for another half-hour, and then Captain Carter dismissed us. We left Halsey's office with Carter's final words ringing in our ears. "Whatever comes, lads, remember I trust you...."

Snap and I decided to walk a portion of the way back to the ship. It was barely more than a mile through this subterranean corridor to where we could get the vertical lift direct to the landing stage.

We started off on the lower level. Once outside the insulation of Halsey's office we did not dare talk of this thing. Not only electrical ears, but every possible eavesdropping device might be upon us. The corridor was two hundred feet or more below the ground level. At this hour of the night this business section was comparatively deserted. The through tube sounded over our heads with the passing of its occasional trains. The ventilators buzzed and whirled. At the cross intersections, the traffic directors dozed at their posts. It was hot and sticky down here, and gloomy with the daylight globes extinguished, and only the night lights to give a dim illumination. The stores and office arcades were all closed and deserted; only an

occasional night-light burning behind their windows.

Our footfalls echoed on the metal grids as we hurried along.

“Nice evening,” said Snap awkwardly.

“Yes,” I said, “isn’t it?”

I felt oppressed. As though prying eyes and ears were here. We walked for a time in silence, each of us busy with memory of what had transpired in Halsey’s office.

Suddenly Snap gripped me. “What’s that?”

“Where?” I whispered.

We stopped at a corner. An entryway was here. Snap pulled me into it. I could feel him quivering with excitement.

“What is it?” I demanded in a whisper.

“We’re being followed. Did you hear anything?”

“No!” Yet I thought now I could hear something. Vague footfalls. A rustling. And a microscopic electrical whine, as though some device were near us.

Snap was fumbling in his pocket. “Wait, I’ve got a pair of low-scale phones.”

He put the little grids against his ears. I could hear the sharp intake of his breath. Then he seized me, pulled me down to the metal floor of the entryway.

“Back, Gregg! Get back!” I could barely hear his whisper. We crouched as far back into the doorway as we could get. I was armed. My official permit for the carrying of the pencil heat-ray allowed me to have it always with me. I drew it now. But there was nothing to shoot at. I felt Snap clamping the grids on my ears. And now I heard something! An intensification of the vague footsteps I had thought I heard before.

There was something following us! Something out in the corridor there now! A street light was nearby. The corridor was dim, but plainly visible; and to my sight it was empty. But there was something there.

Something invisible! I could hear it moving. Creeping towards us. I pulled the grids off my ears.

Snap murmured, "You've got a local phone."

"Yes! I'll get them to give us the street glare!"

I pressed the danger signal, giving our location to the nearest operator. In a second or two we got the light. The street in all this neighborhood burst into a brilliant actinic glare. The thing menacing us was revealed! A figure in a black cloak, crouching thirty feet away across the corridor.

Snap was on his feet. His voice rang shrilly, "There it is! Give it a shot, Gregg!"

Snap was unarmed, but he flung his hands out menacingly. The figure, which may perhaps not have been aware of our city safeguard, was taken wholly by surprise. A human figure. Seven feet tall, at the least, and therefore, I judged, doubtless a Martian man. The black cloak covered his head. He took a step toward us, hesitated, and then turned in confusion.

Snap's shrill voice was bringing help. The whine of a street guard's alarm whistle nearby sounded. The figure was making off! My pencil-ray was in my hand and I pressed its switch. The tiny heat-ray stabbed through the glare, but I missed. The figure stumbled, but did not fall. I saw a bare gray arm come from the cloak, flung up to maintain its balance. Or perhaps my pencil-ray of heat had seared the arm. The gray-skinned arm of a Martian.

Snap was shouting, "Give him another!" But the figure passed beyond the actinic glare and vanished.

We were detained in the turmoil of the corridor for ten minutes or more with official explanations. Then a message from Halsey released us. The Martian who had been following us in his invisible cloak was never caught.

We escaped from the crowd at last and made our way back to the Planetara, where the passengers were already assembling for the outward Martian voyage.

Chapter 2 “A Fleeting Glance--”

I stood on the turret-balcony of the Planetara with Captain Carter and Dr. Frank, the ship surgeon, watching the arriving passengers. It was close to the zero hour: the level of the stage was a turmoil of confusion. The escalators, with the last of the freight aboard, were folded back. But the stage was jammed with the incoming passenger baggage: the interplanetary customs and tax officials with their X-ray and Zed-ray paraphernalia and the passengers themselves, lined up for the export inspection.

At this height, the city lights lay spread in a glare of blue and yellow beneath us. The individual local planes came dropping like birds to our stage. Thirty-eight passengers for this flight to Mars, but that accursed desire of every friend and relative to speed the departing voyager brought a hundred or more extra people to crowd our girders and bring added difficulty to everybody.

Carter was too absorbed in his duties to stay with us

long. But here in the turret Dr. Frank and I found ourselves at the moment with nothing much to do but watch.

“Think we’ll get away on time, Gregg?”

“No,” I said. “And this of all voyages--”

I checked myself, with thumping heart. My thoughts were so full of what Halsey and Carter had told us that it was difficult to rein my tongue. Yet here in the turret, unguarded by insulation, I could say nothing. Nor would I have dared mention the Grantline Moon Expedition to Dr. Frank. I wondered what he knew of this affair. Perhaps as much as I--perhaps nothing.

He was a thin, dark, rather smallish man of fifty, this ship’s surgeon, trim in his blue and white uniform. I knew him well: we had made several flights together. An American--I fancy of Jewish ancestry. A likable man, and a skillful doctor and surgeon. He and I had always been good friends.

“Crowded,” he said. “Johnson says thirty-eight. I hope

they're experienced travelers. This pressure sickness is a rotten nuisance--keeps me dashing around all night assuring frightened women they're not going to die. Last voyage, coming out of the Venus atmosphere--"

He plunged into a lugubrious account of his troubles with space-sick voyagers. But I was in no mood to listen. My gaze was down on the spider incline, up which, over the bend of the ship's sleek, silvery body, the passengers and their friends were coming in little groups. The upper deck was already jammed with them.

The Planetara, as flyers go, was not a large vessel. Cylindrical of body, forty feet maximum beam, and two hundred and seventy-five feet in overall length. The passenger superstructure--no more than a hundred feet long--was set amidships. A narrow deck, metallic-enclosed, and with large bulls-eye windows, encircled the superstructure. Some of the cabins opened directly onto the deck. Others had doors to the interior corridors. There were half a dozen small but luxurious public rooms.

The rest of the vessel was given to freight storage and the mechanism and control compartments. Forward of the passenger structure the deck level continued under the cylindrical dome-roof to the bow. The forward watch-tower observatory was here; officers' cabins; Captain Carter's navigating rooms and Dr. Frank's office. Similarly, under the stern-dome, was the stern watch-tower and a series of power compartments.

Above the superstructure a confusion of spider bridges, ladders and balconies were laced like a metal network. The turret in which Dr. Frank and I now stood was perched here. Fifty feet away, like a bird's nest, Snap's instrument room stood clinging to the metal bridge. The dome-roof, with the glassite windows rolled back now, rose in a mound-peak to cover this highest middle portion of the vessel.

Below, in the main hull, blue-lit metal corridors ran the entire length of the ship. Freight storage compartments; gravity control rooms; the air renewal systems; heater and ventilators and pressure mechanisms--all were located there. And the

kitchens, stewards' compartments, and the living quarters of the crew. We carried a crew of sixteen, this voyage, exclusive of the navigating officers, and the purser, Snap Dean, and Dr. Frank.

The passengers coming aboard seemed a fair representation of what we usually had for the outward voyage to Ferrok-Shahn. Most were Earth people--and returning Martians. Dr. Frank pointed out one. A huge Martian in a gray cloak. A seven-foot fellow.

"His name is Set Miko," Dr. Frank remarked. "Ever heard of him?"

"No," I said. "Should I?"

"Well--" The doctor suddenly checked himself, as though he were sorry he had spoken.

"I never heard of him," I repeated slowly.

An awkward silence fell suddenly between us.

There were a few Venus passengers. I saw one of them presently coming up the incline, and recognized her. A girl traveling alone. We had brought her from Grebhar, last voyage but one. I remembered her. An alluring sort of girl, as most of them are. Her name was Venza. She spoke English well. A singer and dancer who had been imported to Great-New York to fill some theatrical engagement. She'd made quite a hit on the Great White Way.

She came up the incline, with the carrier ahead of her. Gazing up, she saw Dr. Frank and me at the turret window and waved her white arm in greeting. And flashed us a smile.

Dr. Frank laughed. "By the gods of the airways, there's Alta Venza! You saw that look, Gregg? That was for me, not you."

"Reasonable enough," I retorted. "But I doubt it--the Venza was nothing if not impartial."

I wondered what could be taking Venza now to Mars. I was glad to see her. She was diverting. Educated.

Well-traveled. Spoke English with a colloquial, theatrical manner more characteristic of Great-New York than of Venus. And for all her light banter, I would rather put my trust in her than any Venus girl I had ever met.

The hum of the departing siren was sounding. Friends and relatives of the passengers were crowding the exit incline. The deck was clearing. I had not seen George Prince come aboard. And then I thought I saw him down on the landing stage, just arrived from a private tube-car. A small, slight figure. The customs men were around him: I could only see his head and shoulders. Pale, girlishly handsome face; long, black hair to the base of his neck. He was bareheaded, with the hood of his traveling-cloak pushed back.

I stared, and I saw that Dr. Frank was also gazing down. But neither of us spoke.

Then I said upon impulse, "Suppose we go down to the deck, Doctor?"

He acquiesced. We descended to the lower room of

the turret and clambered down the spider ladder to the upper deck-level. The head of the arriving incline was near us. Preceded by two carriers who were littered with hand-baggage, George Prince was coming up the incline. He was closer now. I recognized him from the type we had seen in Halsey's office.

And then, with a shock, I saw it was not so. This was a girl coming aboard. An arch-light over the incline showed her clearly when she was half way up. A girl with her hood pushed back; her face framed in thick black hair. I saw now it was not a man's cut of hair; but long braids coiled up under the dangling hood.

Dr. Frank must have remarked my amazed expression.

"Little beauty, isn't she?"

"Who is she?"

We were standing back against the wall of the superstructure. A passenger was near us--the

Martian whom Dr. Frank had called Miko. He was loitering here, quite evidently watching this girl come aboard. But as I glanced at him he looked away and casually sauntered off.

The girl came up and reached the deck. "I am in A22," she told the carrier. "My brother came aboard two hours ago."

Dr. Frank answered my whisper. "That's Anita Prince."

She was passing quite close to us on the deck, following the carrier, when she stumbled and very nearly fell. I was nearest to her. I leaped forward and caught her as she went down.

"Oh!" she cried.

With my arm about her, I raised her up and set her upon her feet again. She had twisted her ankle. She balanced herself upon it. The pain of it eased up in a moment.

“I’m--all right--thank you!”

In the dimness of the blue-lit deck, I met her eyes. I was holding her with my encircling arm. She was small and soft against me. Her face, framed in the thick, black hair, smiled up at me. Small, oval face--beautiful--yet firm of chin, and stamped with the mark of its own individuality. No empty-headed beauty, this.

“I’m all right, thank you very much--”

I became conscious that I had not released her. I felt her hands pushing at me. And then it seemed that for an instant she yielded and was clinging. And I met her startled, upflung gaze. Eyes like a purple night with the sheen of misty starlight in them.

I heard myself murmuring, “I beg your pardon. Yes, of course!” I released her.

She thanked me again and followed the carrier along the deck. She was limping slightly from the twisted ankle.

An instant, while she had clung to me--and I had held her. A brief flash of something, from her eyes to mine--from mine back to hers. The poets write that love can be born of such a glance. The first meeting, across all the barriers of which love springs unsought, unbidden--defiant, sometimes. And the troubadours of old would sing: "A fleeting glance; a touch; two wildly beating hearts--and love was born."

I think, with Anita and me, it must have been like that....

I stood gazing after her, unconscious of Dr. Frank, who was watching me with his humorous smile. And presently, no more than a quarter beyond the zero hour, the Planetara got away. With the dome-windows battened tightly, we lifted from the landing stage and soared over the glowing city. The phosphorescence of the electronic tubes was like a comet's tail behind us as we slid upward.

At the trineight hour the heat of our atmospheric passage was over. The passengers had all retired. The ship was quiet, with empty decks and dim, silent

corridors. Vibrationless, with the electronic engines cut off and only the hum of the Martel magnetizers to break the unnatural stillness. We were well beyond the earth's atmosphere, heading out in the cone-path of the earth's shadow, in the direction of the moon.

Chapter 3 In the Helio-room

At six A.M., earth Eastern time, which we were still carrying, Snap Dean and I were alone in his instrument room, perched in the network over the Planetara's deck. The bulge of the dome enclosed us; it rounded like a great observatory window some twenty feet above the ceiling of this little metal cubby-hole.

The Planetara was still in the earth's shadow. The firmament--black interstellar space with its blazing white, red and yellow stars--lay spread around us. The moon, with nearly all its disc illumined, hung, a great silver ball, over our bow quarter. Behind it, to one side, Mars floated like the red tip of a smoldering cigarillo in the blackness. The earth, behind our stern, was dimly, redly visible--a giant sphere, etched with

the configurations of its oceans and continents. Upon one limb a touch of the sunlight hung on the mountain-tops with a crescent red-yellow sheen.

And then we plunged from the cone-shadow. The sun, with the leaping Corona, burst through the blackness behind us. The earth lighted into a huge, thin crescent with hooked cusps.

To Snap and me, the glories of the heavens were too familiar to be remarked. And upon this voyage particularly we were in no mood to consider them. I had been in the helio-room several hours. When the Planetara started, and my few routine duties were over, I could think of nothing save Halsey's and Carter's admonition: "Be on your guard. And particularly--watch George Prince."

I had not seen George Prince. But I had seen his sister, whom Carter and Halsey had not bothered to mention. My heart was still pounding with the memory....

When the passengers had retired and the ship

quieted, I prowled through the passenger corridors. This was about the trinight hour.[Trinight Hour, i.e., 3 A. M.] Hot as the corridors of hell, with our hull and the glassite dome seething with the friction of our atmospheric flight. But the refrigerators mitigated that; the ventilators blasted cold air from the renewers into every corner of the vessel. Within an hour or two, with the cold of space striking us, it was hot air that was needed.

Dr. Frank evidently was having little trouble with pressure-sick passengers [Pressure sickness. Caused by the difficulty of maintaining a constantly normal air pressure within the vessel owing to the sudden, extreme changes from heat to cold.]--the Planetara's equalizers were fairly efficient. I did not encounter Dr. Frank. I prowled through the silent metal lounges and passages. I went to the door of A22. It was on the deck-level, in a tiny transverse passage just off the main lounging room. Its name-grid glowed with the letters: "*Anita Prince*." I stood in my short white trousers and white silk shirt, like a cabin steward gawping. Anita Prince! I had never heard the name

until this night. But there was magic music in it now, as I murmured it to myself. Anita Prince....

She was here, doubtless asleep, behind this small metal door. It seemed as though that little oval grid were the gateway to a fairyland of my dreams.

I turned away. And thought of the Grantline Moon Expedition stabbed at me. George Prince--Anita's brother--he whom I had been told to watch. This renegade--associate of dubious Martians, plotting God knows what.

I saw, upon the adjoining door, "A20, *George Prince*." I listened. In the humming stillness of the ship's interior there was no sound from these cabins. A20 was without windows, I knew. But Anita's room had a window and a door which gave upon the deck. I went through the lounge, out its arch, and walked the deck length. The deck door and window of A22 were closed and dark.

The ten-foot-wide deck was dim with white starlight from the side ports. Chairs were here, but they were

all empty. From the bow windows of the arching dome a flood of moonlight threw long, slanting shadows down the deck. At the corner where the superstructure ended, I thought I saw a figure lurking as though watching me. I went that way, but it vanished.

I turned the corner, went the width of the ship to the other side. There was no one in sight save the observer on his spider bridge, high in the bow network, and the second officer, on duty on the turret balcony almost directly over me.

As I stood and listened, I suddenly heard footsteps. From the direction of the bow a figure came. Purser Johnson.

He greeted me. "Cooling off, Gregg?"

"Yes," I said.

He went past me and turned into the smoking room door nearby.

I stood a moment at one of the deck windows, gazing at the stars; and for no reason at all I realized I was tense. Johnson was a great one for his regular sleep--it was wholly unlike him to be roaming about the ship at such an hour. Had he been watching me? I told myself it was nonsense. I was suspicious of everyone, everything, this voyage.

I heard another step. Captain Carter appeared from his chart-room which stood in the center of the narrowing open deck space near the bow. I joined him at once.

"Who was that?" he half-whispered.

"Johnson."

"Oh, yes." He fumbled in his uniform; his gaze swept the moonlit deck. "Gregg--take this." He handed me a small metal box. I stuffed it at once into my shirt.

"An insulator," he added, swiftly. "Snap is in his office. Take it to him, Gregg. Stay with him--you'll have a measure of security--and you can help him to make

the photographs.” He was barely whispering. “I won’t be with you--no use making it look as though we were doing anything unusual. If your graphs show anything--or if Snap picks up any message--bring it to me.” He added aloud, “Well, it will be cool enough presently, Gregg.”

He sauntered away toward his chart-room.

“By heavens, what a relief!” Snap murmured as the current went on. We had wired his cubby with the insulator; within its barrage we could at last talk with a degree of freedom.

“You’ve seen George Prince, Gregg?”

“No. He’s assigned A20. But I saw his sister. Snap, no one ever mentioned--”

Snap had heard of her, but he hadn’t known that she was listed for this voyage. “A real beauty, so I’ve heard. Accursed shame for a decent girl to have a brother like that.”

I could agree with him there, but I made no comment.

It was now 6 A.M. Snap had been busy all night with routine cosmo-radios from the earth, following our departure. He had a pile of them beside him. Many were for the passengers; but anything that savored of a code was barred.

“Nothing queer looking?” I suggested.

“No. Not a thing.”

We were at this time no more than some sixty-five thousand miles from the moon’s surface. The Planetara presently would swing upon her direct course for Mars. There was nothing which could cause passenger comment in this close passing of the moon; normally we used the satellite’s attraction to give us additional starting speed.

It was now or never that a message would come from Grantline. He was supposed to be upon this earthward side of the moon. While Snap had rushed through with his routine, I had searched the moon

surface with our glass, as I knew Carter was searching it--and also the observer in his tower, very possibly.

But there was nothing. Copernicus and Kepler lay in full sunlight. The heights of the lunar mountains, the depths of the barren, empty seas were etched black and white, clear and clean. Grim, forbidding desolation, this unchanging moon! In romance, moonlight may shimmer and sparkle to light a lover's smile; but the reality of the moon is cold and bleak. There was nothing to show my prying eyes where the intrepid Grantline might be.

"Nothing at all, Snap."

And Snap's helio mirrors, attuned for an hour now to pick up the faintest signal, were motionless.

"If he has concentrated any appreciable amount of radio-active ore," said Snap, "we should get an impulse from its Gamma rays."

But our receiving shield was dark, untouched. We

tried taking hydrogen photographic impressions of the visible moon surface. A sequence of them, with stereoscopic lenses, forty-eight to the second. Our mirror-grid gave the magnified images; the spectro-heliograph, with its wave-length selection, pictured the mountain-levels, and slowly descended into the deepest seas.

There was nothing.

Yet in those moon caverns--a million million recesses amid the crags of that tumbled, barren surface--the pin-point of movement which might have been Grantline's expedition could so easily be hiding! Could he have the ore insulated, fearing its Gamma rays would betray its presence to hostile watchers?

Or might disaster have come to him? Or he might not be upon this hemisphere of the moon at all....

My imagination, sharpened by fancy of a lurking menace which seemed everywhere about the Planetara this voyage, ran rife with fears for Johnny Grantline. He had promised to communicate this

voyage. It was now, or perhaps never.

Six-thirty came and passed. We were well beyond the earth's shadow now. The firmament blazed with its vivid glories; the sun behind us was a ball of yellow-red leaping flames. The earth hung, opened to a huge, dull-red half-sphere.

We were within some forty thousand miles of the moon. Giant white ball--all of its disc visible to the naked eye. It poised over the bow, and presently, as the Planetara swung upon her course for Mars, it shifted sidewise. The light of it glared white and dazzling in our tiny side windows.

Snap, with his habitual red celluloid eyeshade shoved high on his forehead, worked over our instruments.

"Gregg!"

The receiving shield was glowing a trifle! Gamma rays were bombarding it! It glowed, gleamed phosphorescent, and the audible recorder began sounding its tiny tinkling murmurs.

Gamma rays! Snap sprang to the dials. The direction and strength were soon obvious. A richly radio-active ore body, of considerable size, was concentrated upon this hemisphere of the moon! It was unmistakable.

“He’s got it, Gregg! He’s--”

The tiny helio mirrors began quivering. Snap exclaimed triumphantly, “Here he comes! By God, the message at last! Bar off that light!”

I flung on the absorbers. The moonlight bathing the little room went into them and darkness sprang around us. Snap fumbled at his instrument board. Actinic light showed dimly in the quivering, thumbnail mirrors. Two of them. They hung poised on their cobweb wires, infinitely sensitive to the infra-red light-rays Grantline was sending from the moon. The mirrors in a moment began swinging. On the scale across the room the actinic beams from them were magnified into sweeps of light.

The message!

Snap spelled it out, decoded it.

“Success! Stop for ore on your return voyage. Will give you our location later. Success beyond wildest hopes--”

The mirrors hung motionless. The shield, where the Gamma rays were bombarding, went suddenly dark.

Snap murmured, “That’s all. He’s got the ore! ‘Success beyond wildest hopes.’ That must mean an enormous quantity of it available!”

We were sitting in darkness, and abruptly I became aware that across our open window, where the insulation barrage was flung, the air was faintly hissing. An interference there! I saw a tiny swirl of purple sparks. Someone--some hostile ray from the deck beneath us, or from the spider bridge that led to our little room--someone out there trying to pry in!

Snap impulsively reached for the absorbers to let in the outside light--it was all darkness to us outside. But I checked him.

“Wait!” I cut off our barrage, opened our door and stepped to the narrow metal bridge.

“Wait, Snap! You stay there.” I added aloud, “Well, Snap, I’m going to bed. Glad you’ve cleaned up that batch of work.”

I banged the door upon him. The lacework of metal bridges and ladders seemed empty. I gazed up to the dome, and forward and aft. Twenty feet beneath me was the metal roof of the cabin superstructure. Below it, both sides of the deck showed. All patched with moonlight.

No one visible down there. I descended a ladder. The deck was empty. But in the silence something was moving! Footsteps moving away from me down the deck! I followed; and suddenly I was running. Chasing something I could hear, but could not see. It turned into the smoking room.

I burst in. And a real sound smothered the phantom. Johnson the purser was sitting here alone in the dimness. He was smoking. I noticed that his cigar

held a long, frail ash. It could not have been him I was chasing. He was sitting there quite calmly. A thick-necked, heavy fellow, easily out of breath. But he was breathing calmly now.

He sat up with amazement at my wild-eyed appearance, and the ash jarred from his cigar.

“Gregg! What in the devil--”

I tried to grin. “I’m on my way to bed--worked all night helping Snap with those damn Earth messages.”

I went past him, out the door into the main interior corridor. It was the only way the invisible prowler could have gone. But I was too late now--I could hear nothing. I dashed forward into the main lounge. It was empty, dim and silent, a silence broken presently by a faint click--a stateroom door hastily closing. I swung and found myself in a tiny transverse passage. The twin doors of A22 and A20 were before me.

The invisible eavesdropper had gone into one of these rooms! I listened at each of the panels, but there was

only silence within.

The interior of the ship was suddenly singing with the steward's siren--the call to awaken the passengers. It startled me. I moved swiftly away. But as the siren shut off, in the silence I heard a soft, musical voice:

"Wake up, Anita--I think that's the breakfast call."

And her answer: "All right, George. I hear it."

Chapter 4 A Burn on a Martian Arm

I did not appear at that morning meal. I was exhausted and drugged with lack of sleep. I had a moment with Snap, to tell him what had occurred. Then I sought out Carter. He had his little chart-room insulated. And we were cautious. I told him what Snap and I had learned: the Gamma rays from the moon, proving that Grantline had concentrated a considerable ore-body. I also told him the message from Grantline.

"We'll stop on the way back, as he directs, Gregg." He

bent closer to me. "At Ferrok-Shahn I'm going to bring back a cordon of Interplanetary Police. The secret will be out, of course, when once we stop at the moon. We have no right, even now, to be flying this vessel as unguarded as it is."

He was very solemn. And he was grim when I told him of the invisible eavesdropper.

"You think he overheard Grantline's message?"

"I don't know," I said.

"Who was it? You seem to feel it was George Prince?"

"Yes."

I was convinced that the prowler had gone into A20. When I mentioned the purser, who seemed to have been watching me earlier in the night, and again was sitting in the smoking room when the eavesdropper fled past, Carter looked startled.

"Johnson is all right, Gregg."

“Is he? Does he know anything about this Grantline affair?”

“No--no,” said the captain hastily. “You haven’t mentioned it, have you?”

“Of course I haven’t. I’ve been wondering why Johnson didn’t hear that eavesdropper. I could hear him when I was chasing him. But Johnson sat perfectly unmoved and let him go by. What was he sitting there for, anyway, at that hour of the morning?”

“You’re too suspicious, Gregg. Overwrought. But you’re right--we can’t be too careful. I’m going to have that Prince suite searched when I catch it unoccupied. Passengers don’t ordinarily travel with invisible cloaks. Go to bed, Gregg--you need a rest.”

I went to my cabin. It was located aft, on the stern deck-space, near the stern watch-tower. A small metal room, with a desk, a chair and bunk. I made sure no one was in it. I sealed the lattice grill and the door, set the alarm trigger against any opening of them,

and went to bed.

The siren for the mid-day meal awakened me. I had slept heavily. I felt refreshed. And hungry.

I found the passengers already assembled at my table when I arrived in the dining salon. It was a low-vaulted metal room of blue and yellow tube-lights. At the sides its oval windows showed the deck, with its ports of the dome-side, through which a vista of the starry firmament was visible. We were well on our course to Mars. The moon had dwindled to a pin-point of light beside the crescent earth. And behind them our sun blazed, visually the largest orb in the heavens. It was some sixty-eight million miles from the earth to Mars, this voyage. A flight, under ordinary circumstances, of some ten days.

There were five tables in the dining salon, each with eight seats. Snap and I had one of the tables. We sat at the ends, with three passengers on each of the sides.

Snap was in his seat when I arrived. He eyed me

down the length of the table.

“Good morning, Gregg. We missed you at breakfast. Not pressure-sick, I hope?”

There were three passengers already seated at our table--all men. Snap, in a gay mood, introduced me.

“This is our third officer, Gregg Haljan. Big, handsome fellow, isn’t he? And as pleasant as he is good-looking. Gregg, this is Sero Ob Hahn.”

I met the keen, dark-eyed somber gaze of a Venus man of middle age. A small, slim, graceful man, with sleek black hair. His pointed face, accentuated by the pointed beard, was pallid. He wore a white and purple robe; upon his breast was a huge platinum ornament, a device like a star and cross entwined.

“I am happy to meet you, sir.” His voice was soft and sleek.

“Ob Hahn,” I repeated. “I should have heard of you, no doubt. But--”

A smile plucked at his thin, gray lips. "That is the error of mine, not yours. My mission is that all the universe shall hear of me."

"He's preaching the religion of the Venus Mystics," Snap explained.

"And this enlightened gentleman," said Ob Hahn ironically, "has just termed it fetishism. The ignorance--"

"Oh, I say!" protested the man at Ob Hahn's side. "I mean, you seem to think I intended something opprobrious. As a matter of fact--"

"We've an argument, Gregg," laughed Snap. "This is Sir Arthur Coniston, an English gentleman, lecturer and sky-trotter--that is, he will be a sky-trotter; he tells us he plans a number of voyages."

The tall Englishman in his white linen suit bowed acknowledgment. "My compliments, Mr. Haljan. I hope you have no strong religious convictions, else we will make your table here very miserable!"

The third passenger had evidently kept out of the argument. Snap introduced him as Rance Rankin. An American--a quiet, blond fellow of thirty-five or forty.

I ordered my breakfast and let the argument go on.

"Won't make me miserable," said Snap. "I love an argument. You said, Sir Arthur?..."

"I mean to say, I think I said too much. Mr. Rankin, you are more diplomatic."

Rankin laughed. "I am a magician," he said to me. "A theatrical entertainer. I deal in tricks--how to fool an audience--" His keen, amused gaze was on Ob Hahn. "This gentleman from Venus and I have too much in common to argue."

"A nasty one!" the Englishman exclaimed. "By Jove! Really, Mr. Rankin, you're a bit too cruel!"

I could see we were doomed to have turbulent meals this voyage. I like to eat in quiet; arguing passengers always annoy me. There were still three seats vacant

at our table; I wondered who would occupy them. I soon learned the answer--for one seat at least.

Rankin said calmly:

“Where is the little Venus girl this meal?” His glance went to the empty seat at my right hand. “The Venza--wasn’t that her name? She and I are destined for the same theater in Ferrok-Shahn.”

So Venza was to sit beside me. It was good news. Ten days of a religious argument three times a day would be intolerable. But the cheerful Venza would help.

“She never eats the mid-day meal,” said Snap. “She’s on the deck, having orange juice. I guess it’s the old gag about diet, eh?”

My attention wandered about the salon. Most of the seats were occupied. At the captain’s table I saw the objects of my search. George Prince and his sister sat one on each side of the captain. I saw George Prince in the life now as a man who looked hardly twenty-five. He was at this moment evidently in a gay mood. His clean-cut, handsome profile, with its poetic dark

curls, was turned toward me. There seemed little of the villain about him.

And I saw Anita Prince now as a dark-haired, black eyed little beauty, in feature resembling her brother very strongly. She presently finished her meal. She rose, with him after her. She was dressed in Earth fashion--white blouse and dark jacket, wide, knee-length trousers of gray, with a red sash her only touch of color. She went past me, flashed me her smile and nod.

My heart was pounding. I answered her greeting, and met George Prince's casual gaze. He, too, smiled, as though to signify that his sister had told him of the service I had done her. Or was his smile an ironical memory of how he had eluded me this morning when I chased him?

I gazed after his small, white-suited figure as he followed Anita from the salon. And thinking of her, I prayed that Carter and Halsey might be wrong. Whatever plotting against the Grantline Expedition might be going on, I hoped that George Prince was

innocent of it. Yet I knew in my heart it was a futile hope. Prince had been that eavesdropper outside the helio-room. I could not really doubt it. But that his sister must be ignorant of what he was doing, I was sure.

My attention was brought suddenly back to the reality of our table. I heard Ob Hahn's silky voice:

"We passed quite close to the moon last night, Mr. Dean."

"Yes," said Snap. "We did, didn't we? Always do--it's a technical problem of the exigencies of interstellar navigation. Explain it to them, Gregg--you're an expert."

I waved it away with a laugh. There was a brief silence. I could not help noticing Sir Arthur Coniston's queer look, and I think I have never seen so keen a glance as Rance Rankin shot at me. Were all these people aware of Grantline's treasure on the moon? It suddenly seemed so. I wished fervently at that instant that the ten days of this voyage were over

and we were safely at Ferrok-Shahn. Captain Carter was absolutely right. Coming back we would have a cordon of interplanetary police aboard.

Sir Arthur broke the awkward silence. "Magnificent sight, the moon, from so close a viewpoint--though I was too much afraid of pressure-sickness to be up to see it."

I had nearly finished my hasty meal when another incident shocked me. The two other passengers at our table came in and took their seats. A Martian girl and man. The girl had the seat at my left, with the man beside her. All Martians are tall. This girl was about my own height--that is, six feet, two inches. The man was seven feet or more. Both wore the Martian outer robe. The girl flung hers back. Her limbs were encased in pseudo-mail. She looked, as all Martians like to look, a very warlike Amazon. But she was a pretty girl. She smiled at me with a keen-eyed, direct gaze.

"Mr. Dean said at breakfast that you were big and handsome. You are."

They were brother and sister, these Martians. Snap introduced them as Set Miko and Setta Moa. ["Set and Setta," the Martian equivalent of Mr. and Miss.]

This Miko was, from our Earth standards, a tremendous, brawny giant. Not spindly, like most Martians, this fellow, for all his seven feet of height, was almost heavy-set. He wore a plaited leather jerkin beneath his robe, and knee pants of leather out of which his lower legs showed as gray, hairy pillars of strength. He had come into the salon with a swagger, his sword-ornament clanking.

"A pleasant voyage so far," he said to me as he started his meal. His voice had the heavy, throaty rasp characteristic of the Martian. He spoke perfect English--both Martians and Venus people are by heritage extraordinary linguists. Miko and his sister Moa had a touch of Martian accent, worn almost away by living for some years in Great-New York.

The shock to me came within a few minutes. Miko, absorbed in attacking his meal, inadvertently pushed back his robe to bare his forearm. An instant only,

then it dropped again to his wrist. But in that instant I had seen, upon the gray flesh, a thin sear turned red. A very recent burn--as though a pencil-ray of heat had caught his arm.

My mind flung back. Only last night in the City Corridor, Snap and I had been followed by a Martian. I had shot at him with the heat-ray; I thought I had hit him on the arm. Was this the mysterious Martian who had followed us from Halsey's office?

Chapter 5 Venza the Venus Girl

It was shortly after that mid-day meal when I encountered Venza sitting on the starlit deck. I had been in the bow observatory; taken my routine castings of our position and worked them out. I was, I think, of the Planetara's officers the most expert handler of the mathematical mechanical calculators. The locating of our position and charting the trajectory of our course was, under ordinary circumstances, about all I had to do. And it took only a few minutes each twelve hours.

I had a moment with Carter in the isolation of his chart-room.

“This voyage! Gregg, I’m getting like you--too fanciful. We’ve a normal group of passengers, apparently; but I don’t like the look of any of them. That Ob Hahn, at your table--”

“Snaky-looking fellow,” I commented. “He and the Englishman are great on arguments. Did you have Prince’s cabin searched?”

My breath hung on his answer.

“Yes. Nothing unusual among his things. We searched both his room and his sister’s.”

I did not follow that up. Instead I told him about the burn on Miko’s thick gray arm.

He stared. “I wish to the Almighty we were at Ferrok-Shahn. Gregg, to-night when the passengers are asleep, come here to me. Snap will be here, and Dr. Frank. We can trust him.”

“He knows about--about the Grantline treasure?”

“Yes. And so do Balch and Blackstone.”

Balch and Blackstone were our first and second officers.

“We’ll all meet here, Gregg--say about the zero hour. We must take some precautions.”

He suddenly felt he should say no more now. He dismissed me.

I found Venza seated alone in a secluded corner of the starlit deck. A porthole, with the black heavens and the blazing stars, was before her. There was an empty seat nearby.

“Hola-lo, [A Venus form of jocular, intimate greeting.] Gregg! Sit here with me. I have been wondering when you would come after me.”

I sat down beside her. “What are you doing--going to Mars, Venza? I’m glad to see you.”

“Many thanks. But I am glad to see you, Gregg. So handsome a man.... Do you know, from Venus to the earth and I have no doubt on all of Mars, no man will please me more.”

“Glib tongue,” I laughed. “Born to flatter the male-- every girl of your world.” And I added seriously, “You don’t answer my question? What takes you to Mars?”

“Contract. By the stars, what else? Of course, a chance to make a voyage with you--”

“Don’t be silly, Venza.”

I enjoyed her. I gazed at her small, slim figure gracefully reclining in the deck chair. Her long, gray robe parted--by design, I have no doubt--to display her shapely, satin-sheathed legs. Her black hair was coiled in a heavy knot at the back of her neck; her carmined lips were parted with a mocking, alluring smile. The exotic perfume of her enveloped me.

She glanced at me sidewise from beneath her sweeping black lashes.

“Be serious,” I added.

“I am serious. Sober. Intoxicated by you, but sober.”

I said, “What sort of a contract?”

“A theater in Ferrok-Shahn. Good money, Gregg. I’m to be there a year.” She sat up to face me. “There’s a fellow here on the Planetara, Rance Rankin, he calls himself. At our table--a big, good-looking blond American. He says he is a magician. Ever hear of him?”

“That’s what he told me. No, I never heard of him.”

“Nor did I. And I thought I had heard of everyone of any importance. He is listed for the same theater where I’m going. Nice sort of fellow.” She paused, and added suddenly, “If he’s a professional entertainer, I’m a motor-oiler.”

It startled me. “Why do you say that?”

Instinctively my gaze swept the deck. An Earth

woman and child and a small Venus man were in sight, but not within earshot.

“Why do you look so furtive?” she retorted. “Gregg, there’s something strange about this voyage. I’m no fool, nor you, and you know it as well as I do.”

“Rance Rankin--” I prompted.

She leaned closer toward me. “He could fool you. But not me--I’ve known too many real magicians.” She grinned. “I challenged him to trick me. You should have seen him trying to evade!”

“Do you know Ob Hahn?” I interrupted.

She shook her head. “Never heard of him. But he told me plenty at breakfast. By Satan, what a flow of words that devil-driver can muster! He and the Englishman don’t mesh very well, do they?”

She stared at me. I had not answered her grin; my mind was too busy with queer fancies. Halsey’s words: “Things are not always what they seem--”

Were these passengers masqueraders? Put here by George Prince? And then I thought of Miko the Martian, and the burn upon his arm.

“Come back, Gregg! Don’t go wandering off like that!” She dropped her voice to a whisper. “I’ll be serious. I want to know what in the hell is going on aboard this ship. I’m a woman, and I’m curious. You tell me.”

“What do you mean?” I parried.

“I mean a lot of things. What we’ve just been talking about. And what was the excitement you were in just before breakfast this morning?”

“Excitement?”

“Gregg, you may trust me.” For the first time she was wholly serious. Her gaze made sure no one was within hearing. She put her hand on my arm. I could barely hear her whisper: “I know they might have a ray upon us--I’ll be careful.”

“They?”

“Anyone. Something’s going on. You know it--you are in it. I saw you this morning, Gregg. Wild-eyed, chasing a phantom--”

“You?”

“And I heard the phantom! A man’s footsteps. A magnetic reflecting invisible cloak. You couldn’t fool an audience with that--it’s too commonplace. If Rance Rankin tried--”

I gripped her. “Don’t ramble, Venza! You saw me?”

“Yes. My stateroom door was open. I was sitting with a cigarillo. I saw the purser in the smoking room. He was visible from--”

“Wait! Venza, that prowler went through the smoking room!”

“I know he did. I could hear him.”

“Did the purser hear him?”

“Of course. The purser looked up, followed the sound with his gaze. I thought that was queer. He never made a move. And then you came along and he acted innocent. Why? What’s going on, that’s what I want to know!”

I held my breath. “Venza, where did the prowler run to? Can you--”

She whispered calmly, “Into A20. I saw the door open and close--I even think I could see the blurred outline of him. Those magnetic cloaks!” She added, “Why should George Prince be sneaking around with you after him? And the purser acting innocent? And who is this George Prince, anyway?”

The huge Martian, Miko, with his sister Moa came strolling along the deck. They nodded as they passed us.

I whispered, “I can’t explain anything now. But you’re right, Venza: there is something going on. Listen!

Whatever you learn--anything you encounter which looks unusual--will you tell me? I--well, I do trust you--really I do!--but the thing isn't mine to tell."

The somber pools of her eyes were shining. "You are very lovable, Gregg. I won't question you." She was trembling with excitement. "Whatever it is, I want to be in it. Here's something I can tell you now. We've two high-class gold-leaf gamblers aboard. Did you know that?"

"No. Who are--"

"Shac and Dud Ardley. Let me state every detective in Great-New York knows them. They had a wonderful game with that Englishman, Sir Arthur Coniston, this morning. Stripped him of half a pound of eight-inch leaves--a neat little stack. A crooked game, of course. Those fellows are more nimble-fingered than Rance Rankin ever dared to be!"

I sat staring at her. She was a mine of information, this girl.

“And Gregg, I tried my charms on Shac and Dud. Nice men, but dumb. Whatever’s going on, they’re not in it. They wanted to know what kind of a ship this was. Why? Because Shac has a cute little eavesdropping microphone of his own. He had it working in the night last night. He overheard George Prince and that big giant Miko arguing about the moon!”

I gasped. “Venza, softer!”

Against all propriety of this public deck she pretended to drape herself upon me. Her hair smothered my face as her lips almost touched my ear.

“Something about treasure on the moon--Shac couldn’t understand what. And they mentioned you. He didn’t hear what they said because the purser joined them.” Her whispered words tumbled over one another. “A hundred pounds of gold leaf--that’s the purser’s price. He’s with them, whatever it is. He promised to do something for them.”

She stopped. “Well?” I prompted.

“That’s all. Shac’s current was interrupted.”

“Tell him to try it again, Venza! I’ll talk with him. No! I’d better let him alone. Can you get him to keep his mouth shut?”

“I think he might do anything I told him. He’s a man.”

“Find out what you can.”

She sat away from me suddenly. “There’s Anita and George Prince.”

They came to the corner of the deck, but turned back. Venza caught my look. And understood it.

“So you love Anita Prince so much as that, Gregg?” Venza was smiling. “I wish you--I wish some man handsome as you would gaze after me like that.”

She turned solemn. “You may be interested to know that she loves you. I could see it. I knew it when I mentioned you to her this morning.”

“Me? Why, we’ve hardly spoken!”

“Is it necessary? I never heard that it was.”

I could not see Venza’s face; she stood up suddenly. And when I rose beside her, she whispered,

“We should not be seen talking so long. I’ll find out what I can.”

I stared after her slight robed figure as she turned into the lounge archway and vanished.

Chapter 7 A Traitor, and a Passing Asteroid

Captain Carter was grim. “So they’ve bought him off, have they? Go bring him in here, Gregg. We’ll have it out with him now.”

Snap, Dr. Frank, Balch, our first officer, and I were in the captain’s chart-room. It was 4 P.M.--our Earth starting time. We were sixteen hours upon our voyage.

I found Johnson in his office in the lounge. "Captain wants to see you. Close up."

He closed his window upon an American woman passenger who was demanding details of Martian currency, and followed me forward. "What is it, Gregg?"

"I don't know."

Captain Carter banged the slide upon us. The chart-room was insulated. The hum of the current was obvious. Johnson noticed it. He started at the hostile faces of the surgeon and Balch. And he tried to bluster.

"What is this? Something wrong?"

Carter wasted no words. "We have information, Johnson--there's some under cover plot here aboard. I want to know what it is. Suppose you tell us frankly."

The purser looked blank. "What do you mean? We've gamblers aboard, if that's--"

“To hell with that,” growled Balch. “You had a secret interview with that Martian, Set Miko, and with George Prince!”

Johnson scowled from under his heavy brows, and then raised them in surprise.

“Did I? You mean changing their money? I don’t like your tone, Balch. I’m not your under-officer!”

“But you’re under me,” roared the captain. “By God, I’m master here!”

“Well, I’m not disputing that,” said the purser mildly. “This fellow Balch--”

“We’re in no mood for argument,” Dr. Frank cut in. “Clouding the issue.”

“I won’t let it be clouded,” the captain exclaimed. I had never seen Carter so choleric. He was evidently under a tremendous strain. He added,

“Johnson, you’ve been acting suspiciously. I don’t give

a damn whether I've proof of it or not--I say it. Did you, or did you not meet George Prince and that Martian last night?"

"No, I did not. And I don't mind telling you, Captain Carter, that your tone also is offensive!"

"Is it?" Carter suddenly seized him. They were both big men. Johnson's heavy face went purplish red.

"Take your hands!--" They were struggling. Carter's hands were fumbling at the purser's pockets. I leaped, flung an arm around Johnson's neck, pinning him.

"Easy there! We've got you, Johnson!"

Snap tried to help me. "Go on, bang him on the head, Gregg. Now's your chance!"

We searched him. A heat-ray cylinder--that was legitimate. But we found a small battery and eavesdropping microphone similar to the one Venza had mentioned that Shac the gambler was carrying.

“What are you doing with that?” the captain demanded.

“None of your business! Is it criminal? Carter, I’ll have the Line officials dismiss you for this! Take your hands off me, all of you!”

“Look at this!” exclaimed Dr. Frank.

From Johnson’s breast pocket the surgeon drew a folded document. It was the scale drawing of the Planetara’s interior corridors, the lower control rooms and mechanisms. It was always kept in Johnson’s safe. And with it, another document: the ship’s clearance papers--the secret code pass-words for this voyage, to be used if we should be challenged by any interplanetary police ship.

Snap gasped. “My God, that was in my helio-room strong box! I’m the only one on this vessel except the captain who’s entitled to know those pass-words!”

Out of the silence, Balch demanded, “Well, what about it, Johnson?”

The purser was still defiant. “I won’t answer your questions, Balch. At the proper time, I’ll explain-- Gregg Haljan, you’re choking me!”

I eased up. But I shook him. “You’d better talk.”

He was exasperatingly silent.

“Enough!” exploded Carter. “He can explain when we get to port. Meanwhile I’ll put him where he’ll do no more damage. Gregg, lock him in the cage.”

We ignored his violent protestations. The cage--in the old days of sea-vessels on Earth, they called it the brig--was the ship’s jail. A steel-lined, windowless room located under the deck in the peak of the bow. I dragged the struggling Johnson there, with the amazed watcher looking down from the observatory window at our lunging, starlit forms.

“Shut up, Johnson! If you know what’s good for you--”

He was making a fearful commotion. Behind us, where the deck narrowed at the superstructure, half a

dozen passengers were gazing in surprise.

“I’ll have you thrown out of the Service, Gregg Haljan!”

I shut him up finally. And flung him down the ladder into the cage and sealed the deck trap-door upon him. I was headed back for the chart-room when from the observatory came the lookout’s voice.

“An asteroid, Haljan! Officer Blackstone wants you.”

I hurried to the turret bridge. An asteroid was in sight. We had attained nearly our maximum speed now. An asteroid was approaching, so dangerously close that our trajectory would have to be altered. I heard Blackstone’s signals ringing in the control rooms; and met Carter as he ran to the bridge with me.

“That scoundrel! We’ll get more out of him, Gregg. By God, I’ll put the chemicals on him--torture him, illegal or not!”

We had no time for further discussion. The asteroid was rapidly approaching. Already, under the glass, it was a magnificent sight. I had never seen this tiny world before--asteroids are not numerous between the Earth and Mars, or in toward Venus. I never expected to see this one again. How little of the future can we humans fathom, for all our science! If I could only have looked into the future, even for a few short hours! How different then would have been the outcome of this tragic voyage!

The asteroid came rushing at us. Its orbital velocity, I later computed, was some twenty-two miles a second. Our own, at the present maximum, was a fraction over seventy-seven. The asteroid had for some time been under observation by the lookout. He gave his warning only when it seemed that our trajectory should be altered to avoid a dangerously close passing.

At the combined speeds of nearly a hundred miles a second the asteroid swept into view. With the naked eye, at first it was a tiny speck of star-dust, unnoticed in the gem-strewn black velvet of Space. A speck.

Then a gleaming dot, silver white, with the light of our Sun upon it.

Five minutes. The dot grew to a disc. Expanding. A full moon, silver-white. Brightest world in the firmament--the light from it bathed the Planetara, illumined the deck, painting everything with silver.

I stood with Carter and Blackstone on the turret bridge. It was obvious that unless we altered our course, the asteroid would pass too close for safety. Already we were feeling its attraction; from the control rooms came the report that our trajectory was disturbed by this new mass so near.

“Better make your calculations now, Gregg,” Blackstone suggested.

I cast up the rough elements from the observational instruments in the turret. It took me some ten or fifteen minutes. When I had us upon our new course, with the attractive and repulsive plates in the Planetara's hull set in their altered combinations, I went out to the bridge again.

The asteroid hung over our bow quarter. No more than twenty or thirty thousand miles away. A giant ball now, filling all that quadrant of the heavens. The configurations of its mountains--its land and water areas--were plainly visible. Its axial rotation was apparent.

"Perfectly habitable," Blackstone said. "But I've searched all over this hemisphere with the glass. No sign of human life--certainly nothing civilized--nothing in the fashion of cities."

A fair little world, by the look of it. A tiny globe: Blackstone had figured it at some eight hundred miles in diameter. There seemed a normal atmosphere. We could see areas where the surface was obscured by clouds. And oceans, and land masses. Polar icecaps. Lush vegetation at its equator.

Blackstone had roughly cast its orbital elements. A narrow ellipse. No wonder we had never encountered this fair little world before. It had come from the outer region beyond Neptune. At perihelion it would reach inside Mercury, round the Sun, and head

outward again.

We swept past the asteroid at a distance of some six thousand miles. Close enough, in very truth--a minute of flight at our combined speeds totaling a hundred miles a second. I had descended to the passenger deck, where I stood alone at a window, gazing.

The passengers were all gathered to view the passing little world. I saw, not far from me, Anita, standing with her brother; and the giant figure of Miko with them.

Half an hour since, first with the naked eye, this wandering little world had shown itself; it swam slowly past, began to dwindle behind us. A huge half moon. A thinner, smaller quadrant. A tiny crescent, like a silver bar-pin to adorn some lady's breast. And then it was a dot, a point of light indistinguishable among the myriad others hovering in this great black void.

The incident of the passing of the asteroid was over. I turned from the deck window. My heart leaped. The

moment for which all day I had been subconsciously longing was at hand. Anita was sitting in a deck chair, momentarily alone. Her gaze was on me as I looked her way, and she smiled an invitation for me to join her.

Chapter 8 Unspoken Love

Unspoken love! I think if I had yielded to the impulse of my heart, I would have poured out all those protestations of a lover's ecstasy, incongruous here upon this starlit public deck, to a girl I hardly knew. I think, too, she might have received them with a tender acquiescence. The starlight was mirrored in her dark eyes. Misty eyes, with great reaches of unfathomable space in their depths. Yet I felt their tenderness.

Unfathomable strangeness of love! Who am I to write of it, with all the poets of all the ages striving to express the unexpressible? A bond, strangely fashioned by nature, between me and this little dark-haired Earth beauty. As though marked by the stars we were destined to be lovers....

Thus ran the romance of my unspoken thoughts. But I was sitting quietly in the deck chair, striving to regard her gentle beauty impersonally. And saying:

“But Miss Prince, why are you and your brother going to Ferrok-Shahn? His business--”

Even as I voiced it, I hated myself for such a question. So nimble is the human mind that mingled with my rhapsodies of love was my need for information of George Prince....

“Oh,” she said, “this is pleasure, not business, for George.” It seemed to me that a shadow crossed her expressive face. But it was gone in an instant, and she smiled. “We have always wanted to travel. We are alone in the world, you know--our parents died when we were children.”

I filled in her pause. “You will like Mars--so many interesting things to see.”

She nodded. “Yes, I understand so. Our Earth is so much the same all over, cast all in one mould.”

“But a hundred or two hundred years ago it was not, Miss Prince. I have read how the picturesque Orient, differing from--well, Great-New York, or London, for

instance--”

“Transportation did that,” she interrupted eagerly.

“Made everything the same--the people all look alike--dress alike.”

We discussed it. She had an alert, eager mind, childlike with its curiosity, yet strangely matured. And her manner was naïvely earnest. Yet this was no clinging vine, this little Anita Prince. There was a firmness, a hint of masculine strength in her chin, and in her manner.

“If I were a man, what wonders I could achieve in this marvelous age!” Her sense of humor made her laugh at herself. “Easy for a girl to say that,” she added.

“You have greater wonders to achieve, Miss Prince,” I said impulsively.

“Yes? What are they?” She had a very frank and level gaze, devoid of coquetry.

My heart was pounding. “The wonders of the next

generation. A little son, cast in your own gentle image--"

What madness, this clumsy brash talk! I choked it off.

But she took no offense. The dark rose-petals of her cheeks were mantled deeper red, but she laughed.

"That is true." She turned abruptly serious. "I should not laugh. The wonders of the next generation--conquering humans marching on...." Her voice trailed away. My hand went to her arm. Strange tingling something which poets call love! It burned and surged from my trembling fingers into the flesh of her forearm.

The starlight glowed in her eyes. She seemed to be gazing, not at the silver-lit deck, but away into distant reaches of the future. And she murmured:

"A little son, cast in my own gentle image. But with the strength of his father...."

Our moment. Just a breathless moment given us as

we sat there with my hand burning her arm, as though we both might be seeing ourselves joined in a new individual--a little son, cast in his mother's gentle image and with the strength of his father. Our moment, and then it was over. A step sounded. I sat back. The giant gray figure of Miko came past, his great cloak swaying, with his clanking sword-ornament beneath it. His bullet head, with its close-clipped hair, was hatless. He gazed at us, swaggered past, and turned the deck corner.

Our moment was gone. Anita said conventionally, "It has been pleasant to talk with you, Mr. Haljan."

"But we'll have many more," I said. "Ten days--"

"You think we'll reach Ferrok-Shahn on schedule?"

"Yes. I think so.... As I was saying, Miss Prince, you'll enjoy Mars. A strange, aggressively forward-looking people."

An oppression seemed on her. She stirred in her chair.

“Yes, they are,” she said vaguely. “My brother and I know many Martians in Great-New York.” She checked herself abruptly. Was she sorry she had said that? It seemed so.

Miko was coming back. He stopped this time before us.

“Your brother would see you, Anita. He sent me to bring you to his room.”

The glance he shot me had a touch of insolence. I stood up, and he towered a head over me.

Anita said, “Oh yes. I’ll come.”

I bowed. “I will see you again, Miss Prince. I thank you for a pleasant half-hour.”

The Martian led her away. Her little figure was like a child with a giant. It seemed, as they passed the length of the deck with me staring after them, that he took her arm roughly. And that she shrank from him in fear.

And they did not go inside. As though to show me that he had merely taken her from me, he stopped at a distant deck window and stood talking to her. Once he picked her up as one would pick up a child to show it some distant object through the window.

“A little son with the strength of his father...” Her words echoed in my mind. Was Anita afraid of this Martian’s wooing? Yet held to him by some power he might have over her brother? The vagrant thought struck me.

Was it that?

Chapter 8 A Scream in the Night

We kept, on the Planetara, always the time and routine of our port of departure. The rest of that afternoon and evening were a blank of confusion to me. Anita’s words; the touch of my hand upon her arm; that vast realm of what might be for us, like a glimpse of a magic land of happiness which I had seen in her eyes, and perhaps she had seen in mine--all this surged within me.

I wandered about the vessel. I was not hungry. I did not go to the dining salon for dinner. I carried Johnson food and water to his cage; and sat, with my heat-cylinder upon him, listening to his threats of what would happen when he could complain to the Line's higher officials.

But what was Johnson doing carrying a plan of the ship's control rooms in his pockets? And worse: How had he dared open Snap's box in the helio-room and abstract the code pass-words for this voyage? Without them we would be an outlawed vessel, subject to arrest if any patrol hailed us. Had Johnson been planning to sell those pass-words to Miko? I thought so. I tried to get the confession out of him, but could not.

I had a brief consultation with Captain Carter. He was genuinely apprehensive now. The Planetara carried no long-range guns, and very few side-arms. A half-dozen of the heat-ray hand projectors; a few old-fashioned weapons of explosion-rifles and automatic revolvers. And hand projectors with the new Benson curve-light. We had models of this for curved vision, so that one

might see around a corner, so to speak. And with them, we could project the heat-ray in a curve as well.

The weapons were all in Carter's chart-room, save the few we officers always carried. Carter was apprehensive, but of what he could not say. He had not thought that our plan to stop at the Moon for treasure could affect this outward voyage. Any danger would be upon the way back, when the Planetara would be adequately guarded with long-range electronic guns, and manned with police-soldiers.

But now we were practically defenseless....

I had a moment with Venza, but she had nothing new to communicate to me.

And for half an hour I chatted with George Prince. He seemed a gay, pleasant young man. I could almost have fancied I liked him. Or was it because he was Anita's brother? He told me how he looked forward to traveling with her on Mars. No, he had never been there before, he said.

He had a measure of Anita's earnest naïve personality. Or was he a very clever scoundrel, with irony lurking in his soft voice, and a chuckle that he could so befool me?

"We'll talk again, Haljan. You interest me--I've enjoyed it."

He sauntered away from me, joining the saturnine Ob Hahn, with whom presently I heard him discussing religion.

The arrest of Johnson had caused considerable comment among the passengers. A few had seen me drag him forward to the cage. The incident had been the subject of passenger discussion all afternoon. Captain Carter had posted a notice to the effect that Johnson's accounts had been found in serious error, and that Dr. Frank for this voyage would act in his stead.

It was near midnight when Snap and I closed and sealed the helio-room and started for the chart-room, where we were to meet with Captain Carter and the

other officers. The passengers had nearly all retired. A game was in progress in the smoking room, but the deck was almost deserted.

Snap and I were passing along one of the interior corridors. The stateroom doors, with the illumined names of the passengers, were all closed. The metal grid of the floor echoed our footsteps. Snap was in advance of me. His body suddenly rose in the air. He went like a balloon to the ceiling, struck it gently, and all in a heap came floating down and landed on the floor!

“What in the infernal!--”

He was laughing as he picked himself up. But it was a brief laugh. We knew what had happened: the artificial gravity-controls in the base of the ship, which by magnetic force gave us normality aboard, were being tampered with! For just this instant, this particular small section of this corridor had been cut off. The slight bulk of the Planetara, floating in space, had no appreciable gravity pull on Snap’s body, and the impulse of his step as he came to the

unmagnetized area of the corridor had thrown him to the ceiling. The area was normal now. Snap and I tested it gingerly.

He gripped me. "That never went wrong by accident, Gregg! Someone down there--"

We rushed to the nearest descending ladder. In the deserted lower room the bank of dials stood neglected. A score of dials and switches were here, governing the magnetism of different areas of the ship. There should have been a night operator, but he was gone.

Then we saw him lying nearby, sprawled face down on the floor! In the silence and dim lurid glow of the fluorescent tubes, we stood holding our breaths, peering and listening. No one here.

The guard was not dead. He lay unconscious from a blow on the head. A brawny fellow. We had him revived in a few moments. A broadcast flash of the call-buzz brought Dr. Frank in haste from the chart-room.

“What’s the matter?”

We pointed at the unconscious man. “Someone was here,” I said hastily. “Experimenting with the magnetic switches. Evidently unfamiliar with them--pulling one or another to test their workings and so see the reactions on the dials.”

We told him what had happened to Snap in the upper corridor.

Dr. Frank revived the guard in a moment. He was no worse off for the episode, save a lump on his head, and a nasty headache.

But he had little to tell us. He had heard a step. Saw nothing--and then had been struck on the head, by some invisible assailant.

We left him nursing his head, sitting belligerent at his post. Armed now with my heat-ray cylinder which I loaned him.

“Strange doings this voyage,” he told us. “All the crew

knows it--all been talkin' about it. I stick it out now, but when we get back home I'm done with this star travelin'. I belong on the sea anyway. A good old freighter is all right for me."

We hurried back to the upper level. We would indeed have to plan something at this chart-room conference. This was the first tangible attack our adversaries had made.

We were on the passenger deck headed for the chart-room when all three of us stopped short, frozen with horror. Through the silent passenger quarters a scream rang out! A girl's shuddering, gasping scream. Terror in it. Horror. Or a scream of agony. In the silence of the dully vibrating ship it was utterly horrible. It lasted an instant--a single long scream; then was abruptly stilled.

And with blood pounding my temples and rushing like ice through my veins, I recognized it.

Anita!

Chapter 9 The Murder in A 22

“Good God, what was that?” Dr. Frank’s face had gone white in the starlight. Snap stood like a statue of horror.

The deck here was patched as always, silver radiance from the deck ports. The empty deck chairs stood about. The scream was stilled, but now we heard a commotion inside--the rasp of opening cabin doors; questions from frightened passengers; the scurry of feet.

I found my voice. “Anita! Anita Prince!”

“Come on!” shouted Snap. “Was it the Prince girl? I thought so too! In her stateroom, A22!” He was dashing for the lounge archway.

Dr. Frank and I followed. I realized that we passed the deck door and window of A22. But they were dark, and evidently sealed on the inside. The dim lounge was in a turmoil; passengers standing at their cabin doors. I heard Sir Arthur Coniston:

“I say, what was that?”

“Over there,” said another man. “Come back inside, Martha.” He shoved his wife back. “Mr. Haljan!” He plucked at me as I went past.

I shouted, “Go back to your rooms! We want order here--keep back!”

We came to the twin doors of A22 and A20. Both were closed. Dr. Frank was in advance of Snap and me. He paused at the sound of Captain Carter’s voice behind us.

“Was it from in there? Wait a moment!”

Carter dashed up; he had a large heat-ray projector in his hand. He shoved us aside. “Let me in first. Is the door sealed? Gregg, keep those passengers back!”

The door was not sealed. Carter burst into the room. I heard him gasp, “Good God!”

Snap and I shoved back three or four crowding

passengers, and in that instant Dr. Frank had been in the room and out again.

“There’s been an accident! Get back, Gregg! Snap, help him keep the crowd away.” He shoved me forcibly.

From within, Carter was shouting, “Keep them out! Where are you, Frank? Come back here! Send a flash for Balch--I want Balch!”

Dr. Frank went back into the room and banged the cabin door upon Snap and me. I was unarmed--I had loaned my cylinder to the guard in the lower corridor. Weapon in hand, Snap forced the panic-stricken passengers back to their rooms.

“It’s all right! An accident! Miss Prince is hurt.”

Snap reassured them glibly; but he knew no more about it than I. Moa, with a night-robe drawn tight around her thin, tall figure, edged up to me.

“What has happened, Set Haljan?”

I gazed around for her brother Miko, but did not see him.

“An accident,” I said shortly. “Go back to your room. Captain’s orders.”

She eyed me and then retreated. Snap was threatening everybody with his cylinder. Balch dashed up. “What in the hell? Where’s Carter?”

“In there.” I pounded on A22. It opened cautiously. I could see only Carter, but I heard the murmuring voice of Dr. Frank through the interior connecting door to A20.

The captain rasped, “Get out, Haljan! Oh, is that you, Balch? Come in.” He admitted the older officer and slammed the door again upon me. And immediately reopened it.

“Gregg, keep the passengers quiet. Tell them everything’s all right. Miss Prince got frightened, that’s all. Then go up to the turret. Tell Blackstone what’s happened.”

“But I don’t know what’s happened,” I protested miserably.

Carter was grim and white. He whispered, “I think it may turn out to be murder, Gregg! No, not dead yet--Dr. Frank is trying--Don’t stand there like an ass, man! Get to the turret! Verify our trajectory--no--wait--”

The captain was almost incoherent. “Wait a minute, I don’t mean that! Tell Snap to watch his helio-room. Gregg, you and Blackstone stay in the chart-room. Arm yourselves and guard our weapons. By God, this murderer, whoever he is--”

I stammered, “If--if she dies--will you flash us word?”

He stared at me strangely. “I’ll be there presently, Gregg.”

He slammed the door upon me.

I followed his orders, but it was like a dream of horror. The turmoil of the ship gradually quieted.

Snap went to the helio-room; Blackstone and I sat in the tiny steel chart-room. How much time passed, I do not know. I was confused. Anita hurt! She might die.... Murdered.... But why? By whom? Had George Prince been in his own room when the attack came? I thought now I recalled hearing the low murmur of his voice in there with Dr. Frank and Carter.

Where was Miko? It stabbed at me. I had not seen him among the passengers in the lounge.

Carter came into the chart-room. "Gregg, you get to bed--you look like a ghost!"

"But--"

"She's not dead--she may live. Dr. Frank and her brother are with her. They're doing all they can." He told us what had happened. Anita and George Prince had both been asleep, each in their respective rooms. Someone unknown had opened Anita's corridor door.

"Wasn't it sealed?" I demanded.

“Yes. But the intruder opened it.”

“Burst it? I didn’t think it was broken.”

“It wasn’t broken. The assailant opened it somehow, and assaulted Miss Prince--shot her in the chest with a heat-ray. Her left lung.”

“She is conscious?” Balch demanded.

“Yes. But she did not see who did it. Nor did Prince. Her scream awakened him, but the intruder evidently fled out the corridor door of A22, the way he entered.”

I stood weak and shaken at the chart-room entrance. “A little son, cast in the gentle image of his mother. But with the strength of his father...” But Anita--dying, perhaps; and all my dreams were fading into a memory of what might have been.

“You go to bed, Gregg--we don’t need you.”

I was glad enough to get away. I would lie down for an

hour, and then go to Anita's stateroom. I'd demand that Dr. Frank let me see her, if only for a moment.

I went to the stern deck-space where my cubby was located. My mind was confused, but some instinct within me made me verify the seals of my door and window. They were intact. I entered cautiously, switched on the dimmer of the tube-lights, and searched the room. It had only a bunk, my tiny desk, a chair and clothes robe.

There was no evidence of any intruder here. I set my door and window alarm. Then I audiphoned to the helio-room.

"Snap?"

"Yes."

I told him about Anita. Carter cut in on us from the chart-room. "Stop that, you fools!"

We cut off. Fully dressed, I flung myself on my bed. Anita might die....

I must have fallen into a tortured sleep. I was awakened by the sound of my alarm buzzer. Someone was tampering with my door! Then the buzzer ceased; the marauder outside must have found a way of silencing it. But it had done its work--awakened me.

I had switched off the light; my cubby was Stygian dark. A heat-cylinder was in the bunk-bracket over my head; I searched for it, pried it loose softly.

I was fully awake. Alert. I could hear a faint sizzling--someone outside trying to unseal the door. In the darkness, cylinder in hand, I crept from the bunk. Crouched at the door. This time I would capture or kill this night prowler.

The sizzling was faintly audible. My door-seal was breaking. Upon impulse I reached for the door, jerked it open.

No one there! The starlit segment of deck was empty. But I had leaped, and I struck a solid body, crouching in the doorway. A giant man. Miko!

His electronized metallic robe burned my hands. I lunged against him--I was almost as surprised as he. I shot, but the stab of heat evidently missed him.

The shock of my encounter close-circuited his robe; he materialized in the starlight. A brief, savage encounter. He struck the weapon from my hand. He had dropped his hydrogen torch, and tried to grip me. But I twisted away from his hold.

“So it’s you!”

“Be quiet, Gregg Haljan! I only want to talk.”

Without warning, a stab of radiance shot from a weapon in his hand. It caught me. Ran like ice through my veins. Seized and numbed my limbs.

I fell helpless to the deck. Nerves and muscles paralyzed. My tongue was thick and inert. I could not speak, nor move. But I could see Miko bending over me. And hear him:

“I don’t want to kill you, Haljan. We need you.”

He gathered me up like a bundle in his huge arms; carried me swiftly across the deserted deck.

Snap's helio-room in the network under the dome was diagonally overhead. A white actinic light shot from it--caught us, bathed us. Snap had been awake; had heard the slight commotion of our encounter.

His voice rang shrilly: "Stop! I'll shoot!" His warning siren rang out to arouse the ship. His spotlight clung to us.

Miko ran with me a few steps. Then he cursed and dropped me, fled away. I fell like a sack of carbide to the deck. My senses faded into blackness....

"He's all right now."

I was in the chart-room, with Captain Carter, Snap and Dr. Frank bending over me. The surgeon said,

"Can you speak now, Gregg?"

I tried it. My tongue was thick, but it would move.

“Yes.”

I was soon revived. I sat up, with Dr. Frank vigorously rubbing me.

“I’m all right.” I told them what had happened.

Captain Carter said abruptly, “Yes, we know that. And it was Miko also who killed Anita Prince. She told us before she died.”

“Died!...” I leaped to my feet. “She ... died....”

“Yes, Gregg. An hour ago, Miko got into her stateroom and tried to force his love on her. She repulsed him--he killed her.”

It struck me blank. And then with a rush came the thought, “He says Miko killed her....”

I heard myself stammering, “Why--why we must get him!” I gathered my wits; a surge of hate swept me; a wild desire for vengeance.

“Why, by God, where is he? Why don’t you go get him? I’ll get him--I’ll kill him, I tell you!”

“Easy, Gregg!” Dr. Frank gripped me.

The captain said gently, “We know how you feel, Gregg. She told us before she died.”

“I’ll bring him in here to you! But I’ll kill him, I tell you!”

“No you won’t, lad. You’re hysterical now. We don’t want him killed, not attacked even. Not yet. We’ll explain later.”

They sat me down, calming me.

Anita dead. The door of the shining garden was closed. A brief glimpse, given to me and to her of what might have been. And now she was dead....

Chapter 10 A Speck of Human Earth-dust, Falling Free....

I had not been able at first to understand why Captain Carter wanted Miko left at liberty. Within me there was that cry of vengeance, as though to strike Miko down would somehow lessen my own grief at Anita's loss. Whatever Carter's purpose, Snap had not known it. But Balch and Dr. Frank were in the captain's confidence--all three of them working on some plan of action. Snap and I argued it, and thought we could fathom it; and in spite of my desire to kill Miko, the thing looked reasonable.

It was obvious that at least two of our passengers were plotting with Miko and George Prince; trying during this voyage to learn what they could about Grantline's activities on the Moon; scheming doubtless to seize the treasure when the Planetara stopped at the Moon on the return voyage. I thought I could name those masquerading passengers. Ob Hahn, supposedly a Venus Mystic. And Rance Rankin, who called himself an American magician. Those two, Snap and I agreed, seemed most suspicious. And

there was the purser.

With my hysteria still on me, I sat for a time on the deck outside the chart-room with Snap. Then Carter summoned us back, and we sat listening while he, Balch and Dr. Frank went on with their conference. Listening to them I could not but agree that our best plan was to secure evidence which would incriminate all who were concerned in the plot. Miko, we were convinced, had been the Martian who followed Snap and me from Halsey's office in Great-New York. George Prince had doubtless been the invisible eavesdropper outside the helio-room. He knew, and had told the others, that Grantline had found radium-ore on the Moon--that the Planetara would stop there on the way home.

But we could not incarcerate George Prince for being an eavesdropper. Nor had we the faintest tangible evidence against Ob Hahn or Rance Rankin. And even the purser would probably be released by the Interplanetary Court of Ferrok-Shahn when it heard our evidence.

There was only Miko. We could arrest him for the murder of Anita. But the others would be put on their guard. It was Carter's idea to let Miko remain at liberty for a time and see if we could not identify and incriminate his fellows. The murder of Anita obviously had nothing to do with any plot against the Grantline Moon treasure.

"Why," exclaimed Balch, "there might be--probably are--huge Martian interests concerned in this thing. These men here aboard are only emissaries, making this voyage to learn what they can. When they get to Ferrok-Shahn they'll make their report, and then we'll have a real danger on our hands. Why, an outlaw ship could be launched from Ferrok-Shahn that would beat us back to the Moon--and Grantline is entirely without warning of any danger!"

It seemed obvious. Unscrupulous, moneyed criminals in Ferrok-Shahn would be dangerous indeed, once these details of Grantline were given them. And so now it was decided that in the remaining nine days of our outward voyage, we would attempt to secure enough evidence to arrest all these plotters.

“I’ll have them all in the cage when we land,” Carter declared grimly. “They’ll make no report to their principals. The thing will end, be stamped out!”

Ah, the futile plans of men!

Yet we thought it practical. We were all doubly armed now. Explosive bullet-projectors and the heat-ray cylinders. And we had several eavesdropping microphones which we planned to use whenever occasion offered.

It was now, Earth Eastern Time, A.M. Twenty-eight hours only of this eventful voyage were passed. The Planetara was some six million miles from the Earth; it blazed behind us, a tremendous giant.

The body of Anita was being made ready for burial. George Prince was still in his stateroom. Glutz, effeminate little hairdresser, who waxed rich acting as beauty doctor for the women passengers, and who in his youth had been an undertaker, had gone with Dr. Frank to prepare the body.

Gruesome details. I tried not to think of them. I sat, numbed, in the chart-room.

An astronomical burial--there was little precedent for it. I dragged myself to the stern deck-space where, at five A.M., the ceremony took place. Most of the passengers were asleep, unaware of all this--which was why Carter hastened it.

We were a solemn little group, gathered there in the checkered starlight with the great vault of the heavens around us. A dismantled electronic projector--necessary when a long-range gun was mounted--had been rigged up in one of the deck ports.

They brought out the body. I stood apart, gazing reluctantly at the small bundle, wrapped like a mummy in a dark metallic screen-cloth. A patch of black silk rested over her face.

Four cabin stewards carried her. And beside her walked George Prince. A long black robe covered him, but his head was bare. And suddenly he reminded me

of the ancient play-character of Hamlet. His black, wavy hair; his finely chiseled, pallid face, set now in a stern, patrician cast. And staring, I realized that however much of a villain this man not yet thirty might be, at this instant, walking beside the body of his dead sister, he was stricken with grief. He loved that sister with whom he had lived since childhood; and to see him now, with his set white face, no one could doubt it.

The little procession stopped in a patch of starlight by the port. They rested the body on a bank of chairs. The black-robed Chaplain, roused from his bed and still trembling from excitement of this sudden, inexplicable death on board, said a brief, solemn little prayer. An appeal: That the Almighty Ruler of all these blazing worlds might guard the soul of this gentle girl whose mortal remains were now to be returned to Him.

Ah, if ever God seemed hovering close, it was now at this instant, on this starlit deck floating in the black void of space.

Then Carter for just a moment removed the black shroud from her face. I saw her brother gaze silently; saw him stoop and implant a kiss--and turn away. I did not want to look, but I found myself moving slowly forward.

She lay, so beautiful. Her face, white and calm and peaceful in death. My sight blurred. Words seemed to echo: "A little son, cast in the gentle image of his mother...."

"Easy, Gregg!" Snap was whispering to me. He had his arm around me. "Come on away!"

They tied the shroud over her face. I did not see them as they put her body in the tube, sent it through the exhaust-chamber, and dropped it.

But a moment later I saw it--a small black oblong bundle--hovering beside us. It was perhaps a hundred feet away, circling us. Held by the Planetara's bulk, it had momentarily become our satellite. It swung around us like a moon. Gruesome satellite, by nature's laws forever to follow us.

Then from another tube at the bow, Blackstone operated a small Zed-co-ray projector. Its dull light caught the floating bundle, neutralizing its metallic wrappings.

It swung off at a tangent. Speeding. Falling free in the dome of the heavens. A rotating black oblong. But in a moment distance dwindled it to a speck. A dull silver dot with the sunlight on it. A speck of human Earth-dust, falling free....

It vanished. Anita--gone. In my heart was an echo of the prayer that the Almighty might watch over her and guard her always....

Chapter 11 The Electrical Eavesdropper

I turned from the deck. Miko was near me! So he had dared to show himself here among us! But I realized that he could not be aware we knew he was the murderer. George Prince had been asleep, had not seen Miko with Anita. Miko, with impulsive rage, had shot the girl and escaped. No doubt now he was cursing himself for having done it. And he could very

well assume that Anita had died without regaining consciousness to tell who had killed her.

He gazed at me now, here on the deck. I thought for an instant he was coming over to talk to me. Though he probably considered he was not suspected of the murder of Anita, he realized, of course, that his attack on me was known; he must have wondered what action Captain Carter would take.

But he did not approach me; he moved away, and went inside. Moa had been near him; and as though by pre-arrangement with him she now accosted me.

“I want to speak to you, Set Haljan.”

“Go ahead.”

I felt an instinctive aversion for this Martian girl. Yet she was not unattractive. Over six feet tall, straight and slim. Sleek blond hair. Rather a handsome face. Not gray, like the burly Miko, but pink and white. Stern-lipped, yet feminine, too. She was smiling gravely now. Her blue eyes regarded me keenly. She

said gently:

“A sad occurrence, Gregg Haljan. And mysterious. I would not question you--”

“Is that all you have to say?” I demanded, when she paused.

“No. You are a handsome man, Gregg--attractive to women--to any Martian woman.”

She said it impulsively. Admiration for me was on her face, in her eyes--a man cannot miss it.

“Thank you.”

“I mean, I would be your friend. My brother Miko is so sorry about what happened between you and him this morning. He only wanted to talk to you, and he came to your cubby door--”

“With a torch to break its seal,” I interjected.

She waved that away. “He was afraid you would not

admit him. He told you he would not hurt you.”

“And so he struck me with one of your cursed Martian paralyzing rays!”

“He is sorry....”

She seemed gauging me, trying, no doubt, to find out what reprisal would be taken against her brother. I felt sure that Moa was as active as a man in any plan that was under way to capture the Grantline treasure. Miko, with his ungovernable temper, was doing things that put their plans in jeopardy.

I demanded abruptly, “What did your brother want to talk to me about?”

“Me,” she said surprisingly. “I sent him. A Martian girl goes after what she wants. Did you know that?”

She swung on her heel and left me. I puzzled over it. Was that why Miko had struck me down, and was carrying me off? Was my accursed masculine beauty so attractive to this Martian girl? I did not think so. I

could not believe that all these incidents were so unrelated to what I knew was the main undercurrent. They wanted me, had tried to capture me. For something else than because Moa liked my looks....

Dr. Frank found me mooning alone.

“Go to bed, Gregg! You look awful.”

“I don’t want to go to bed.”

“Where’s Snap?”

“I don’t know. He was here a while ago.” I had not seen him since the burial of Anita.

“The captain wants him.” The surgeon left me.

Within an hour the morning siren would arouse the passengers. I was seated in a secluded corner of the deck, when George Prince came along. He went past me, a slight, somber, dark-robed figure. He had on high, thick boots. A hood was over his head, but as he saw me he pushed it back and dropped down beside

me.

But for a moment he did not speak. His face showed pallid in the pallid star-gleams.

“She said you loved her.” His soft voice was throaty with emotion.

“Yes.” I said it almost against my will. There seemed a bond springing between this bereaved brother and me. He added, so softly I could barely hear him, “That makes you, I think, almost my friend. And you thought you were my enemy.”

I held my answer. An incautious tongue running under emotion is a dangerous thing. And I was sure of nothing.

He went on, “Almost my friend. Because--we both loved her, and she loved us both.” He was hardly more than whispering. “And there is aboard--one whom we both hate.”

“Miko!” It burst from me.

“Yes. But do not say it.”

Another silence fell between us. He brushed back the black curls from his forehead. And his dark eyes searched mine.

“Have you an eavesdropping microphone, Haljan?”

I hesitated. “Yes.”

“I was thinking....” He leaned closer toward me. “If, in half an hour, you could use it upon Miko’s cabin—I would rather tell you than the captain or anyone else. The cabin will be insulated, but I shall find a way of cutting off that insulation so that you may hear.”

So George Prince had turned with us! The shock of his sister’s death--himself allied to her murderer!--had been too much for him. He was with us!

Yet his help must be given secretly. Miko would kill him in an instant if it became known.

He had been watchful of the deck. He stood up now.

“I think that is all.”

As he turned away, I murmured, “But I do thank you....”

The name Set Miko glowed upon the small metal door. It was in a transverse corridor similar to A22. The corridor was forward of the lounge: it opened off the small circular library.

The library was unoccupied and unlighted, dim with only the reflected lights from the nearby passages. I crouched behind a cylinder-case. The door of Miko’s room was in sight, being some thirty feet away from me.

I waited perhaps five minutes. No one entered. Then I realized that doubtless the conspirators were already there. I set my tiny eavesdropper on the library floor beside me; connected its little battery; focused its projector. Was Miko’s room insulated? I could not tell. There was a small ventilating grid above the door. Across its opening, if the room were insulated, a blue sheen of radiance would be showing. And there would

be a faint hum. But from this distance I could not see or hear such details, and I was afraid to approach closer. Once in the transverse corridor, I would have no place to hide, no way of escape; if anyone approached Miko's door, I would be discovered.

I threw the current into my little apparatus. I prayed, if it met interference, that the slight sound would pass unnoticed. George Prince had said he would make opportunity to disconnect the room's insulation. He had evidently done so. I picked up the interior sounds at once; my headphone vibrated with them. And with trembling fingers on the little dial between my knees as I crouched in the darkness behind the cylinder-case, I synchronized.

"Johnson is a fool." It was Miko's voice. "We must have the pass-words."

"He got them from the helio-room." A man's voice; I puzzled over it at first, then recognized it. Rance Rankin.

Miko said, "He is a fool. Walking around this ship as

though with letters blazoned on his forehead--‘Watch me--I need watching--’ Hah! No wonder they apprehended him!”

Was George Prince in there? Rankin’s voice said: “He would have turned the papers over to us. I would not blame him too much. What harm--”

“Oh, I’ll release him,” Miko declared. “What harm? That braying ass did us plenty of harm. He has lost the pass-words. Better he had left them in the helio-room.”

Moa was in the room. Her voice said: “We’ve got to have them. The Planetara, upon such an important voyage as this, may be watched. How do we know--”

“It is, no doubt,” Rankin said quietly. “We ought to have the pass-words. When we are in control of this ship....”

It sent a shiver through me. Were they planning to try and seize the Planetara? Now? It seemed so.

“Johnson undoubtedly memorized them,” Moa was saying. “When we get him out--”

“Hahn is to do that, at the signal.” Miko added, “George could do it better, perhaps.”

And then I heard George Prince for the first time. He murmured, “I will try.”

“No need,” said Miko. “I praise where praise is deserved. And I have little praise for you now, George!”

I could not see what happened. A look, perhaps, which Prince could not avoid giving this man he had come to hate. Miko doubtless saw it, and the Martian’s hot anger leaped.

Rankin said hurriedly, “Stop that!”

And Moa: “Let him alone! Sit down, you fool!”

I could hear the sound of a scuffle. A blow--a cry, half suppressed, from George Prince.

Then Miko: "I will not hurt him. Craven coward! Look at him! Hating me--frightened!"

I could fancy George Prince sitting there with murder in his heart, and Miko taunting him:

"Hates me now, because I shot his sister!"

Moa: "Hush!"

"I will not! Why should I not say it? I will tell you something else, George Prince. It was not Anita I shot at, but you! I meant nothing for her, but love. If you had not interfered--"

This was different from what we had figured. George Prince had come in from his own room, had tried to rescue his sister, and in the scuffle, Anita had taken the shot intended for George.

"I did not even know I had hit her," Miko was saying. "Not until I heard she was dead." He added sardonically, "I hoped it was you I had hit, George. And I will tell you this: You hate me no more than I

hate you. If it were not for your knowledge of radium ores--"

"Is this to be a personal wrangle?" Rankin interrupted. "I thought we were here to plan--"

"It is planned," Miko said shortly. "I give orders, I do not plan. I am waiting now for the moment--"

He checked himself. Moa said, "Does Rankin understand that no harm is to come to Gregg Haljan?"

"Yes," said Rankin. "And Dean. We need them, of course. But you cannot make Dean send messages if he refuses, nor make Haljan navigate."

"I know enough to check on them," Miko said grimly. "They will not fool me. And they will obey me, have no fear. A little touch of sulphuric--" His laugh was gruesome. "It makes the most stubborn very willing."

"I wish," said Moa, "we had Haljan safely hidden. If he is hurt--killed--"

So that was why Miko had tried to capture me? To keep me safe so that I might navigate the ship.

It occurred to me that I should get Carter at once. A plot to seize the Planetara? But when?

I froze with startled horror.

The diaphragms at my ears rang with Miko's words: "I have set the time for now! In two minutes--"

It seemed to startle both Rankin and George Prince almost as much as I. Both exclaimed:

"No!"

"No? Why not? Everyone is at his post!"

Prince repeated: "No!"

And Rankin: "But can we trust them? The stewards-- the crew?"

"Eight of them are our own men! You didn't know that, Rankin? They've been aboard the Planetara for

several voyages. Oh, this is no quickly-planned affair, even though we let you in on it so recently. You and Johnson. By God!”

I crouched tense. There was a commotion in the stateroom. Miko had discovered that his insulation was cut off! He had evidently leaped to his feet; I heard a chair overturn. And the Martian’s roar: “It’s off! Did you do that, Prince? By God, if I thought--”

My apparatus went suddenly dead as Miko flung on his insulation. I lost my wits in the confusion; I should have instantly taken off my vibrations. There was interference; it showed in the dark space of the ventilator grid over Miko’s doorway; a snapping in the air there, a swirl of sparks.

I heard with my unaided ears Miko’s roar over his insulation: “By God, they’re listening!”

The scream of a hand-siren sounded from his stateroom. It rang over the ship. His signal! I heard it answered from some distant point. And then a shot; a commotion in the lower corridors....

The attack upon the Planetara had started!

I was on my feet. The shouts of startled passengers sounded, a turmoil beginning everywhere.

I stood momentarily transfixed. The door of Miko's stateroom burst open. He stood there, with Moa, Rankin and George Prince crowding behind him.

He saw me. "You, Gregg Haljan!"

He came leaping at me.

Chapter 12 The Weightless Combat

I was taken wholly by surprise. There was an instant when I stood numbed, fumbling for a weapon at my belt, undecided whether to run or stand my ground. Miko was no more than twenty feet from me. He checked his forward rush. The light from an overhead tube was on him; I saw in his hand the cylinder projector of his paralyzing ray.

I plucked my heat-cylinder from my belt, and fired

without taking aim. My tiny heat-beam flashed. I must have grazed Miko's hand. His roar of anger and pain rang out over the turmoil. He dropped his weapon; then stooped to pick it up. But Moa forestalled him. She leaped and seized it.

"Careful! Fool--you promised not to hurt him!"

A confusion of swift action. Rankin had turned and darted away. I saw George Prince stumbling half in front of the struggling Miko and Moa. And I heard footsteps beside me; a hand gripped me, jerked at me.

Over the turmoil Prince's voice sounded: "Gregg--Haljan!"

I recall I had the impression that Prince was frightened; he had half fallen in front of Miko. And there was Miko's voice:

"Let go of me!"

And Moa: "Come!"

It was Balch gripping me. “Gregg! This way--run! Get out of here! He’ll kill you with that ray--”

Miko’s ray flashed, but George Prince had knocked at his arm. I did not dare fire again. Prince was in the way. Balch, who was unarmed, shoved me violently back.

“Gregg--the chart-room!”

I turned and ran, with Balch after me. Prince had fallen, or been felled by Miko. A flash followed me. Miko’s weapon, but again it missed. He did not pursue me; he ran the other way, through the port-side door of the library.

Balch and I found ourselves in the lounge. Shouting, frightened passengers were everywhere. The place was in wild confusion, the whole ship ringing now with shouts.

“To the chart-room, Gregg!”

I called to the passengers: “Get back to your rooms!”

I followed Balch. We ran through the archway to the deck. In the starlight I saw figures scurrying aft, but none were near us. The deck forward was dim with heavy shadows. The oval window and door of the chart-room were blue-yellow from the tube-lights inside. No one seemed on the deck there; and then, as we approached, I saw, further forward in the bow, the trap-door to the cage standing open. Johnson had been released.

From one of the chart-room windows a heat-ray sizzled. It barely missed us. Balch shouted, "Carter--don't!"

The captain called, "Oh--you, Balch--and Haljan--"

He came out on the deck as we rushed up. His left arm was dangling limp.

"God--this--" He got no further. From the turret overhead a tiny search-beam came down and disclosed us. Blackstone was supposed to be on duty up there, with a course-master at the controls. But, glancing up, I saw, illumined by the turret lights, the

figures of Ob Hahn in his purple-white robe, and Johnson the purser. And on the turret balcony, two fallen men--Blackstone and the course-master.

Johnson was training the spotlight on us. And Hahn fired a Martian ray. It struck Balch beside me. He dropped.

Carter was shouting, "Inside! Gregg, get inside!"

I stopped to raise up Balch. Another beam came down. A heat-ray this time. It caught the fallen Balch full in the chest, piercing him through. The smell of his burning flesh rose to sicken me. He was dead. I dropped his body. Carter shoved me into the chart-room.

In the small, steel-lined room, Carter and I slid the door closed. We were alone here. The thing had come so quickly it had taken Captain Carter, like us all, wholly unawares. We had anticipated spying eavesdroppers, but not this open brigandage. No more than a minute or two had passed since Miko's siren in his stateroom had given the signal for the

attack. Carter had been in the chart-room. Blackstone was in the turret. At the outbreak of confusion, Carter dashed out to see Hahn releasing Johnson from the cage. From the forward chart-room window now I could see where Hahn with a torch had broken the cage-seal. The torch lay on the deck. There had been an exchange of shots; Carter's arm was paralyzed; Johnson and Hahn had escaped.

Carter was as confused as I. There had simultaneously been an encounter up in the turret. Blackstone and the course-master were killed. The lookout had been shot from his post in the forward observatory. His body dangled now, twisted half in and half out of his window.

We could see several of Miko's men--erstwhile members of our crew and steward-corps--scurrying from the turret along the upper bridges toward the dark and silent helio-room. Snap was up there. But was he? The helio-room glowed suddenly with dim light, but there was no evidence of a fight there. The fighting seemed mostly below the deck, down in the hull-corridors. A blended horror of sounds came up to

us. Screams, shouts, and the hissing and snapping of ray weapons. Our crew--such of them as were loyal--were making a stand down below. But it was brief. Within a minute it died away. The passengers, amidships in the superstructure, were still shouting. Then above them Miko's roar sounded.

"Be quiet! Go in your rooms--you will not be harmed."

The brigands in these few minutes were in control of the ship. All but this little chart-room, where, with most of the ship's weapons, Carter and I were intrenched.

"God, Gregg, that this should come upon us!"

Carter was fumbling with the chart-room weapons.

"Here, Gregg, help me. What have you got? Heat-ray? That's all I had ready."

It struck me then as I helped him make the connections that Carter in this crisis was at best an inefficient commander. His red face had gone splotchy

purple; his hands were trembling. Skilled as captain of a peaceful liner, he was at a loss now. Nor could I blame him. It is easy to say we might have taken warning, done this or that, and come triumphant through this attack. But only the fool looks backward and says, "I would have done better."

I tried to summon my wits. The ship was lost to us, unless Carter and I could do something. Our futile weapons! They were all here--four or five heat-ray hand projectors that could send a pencil-ray a hundred feet or so. I shot one diagonally up at the turret where Johnson was leering down at our rear window, but he saw my gesture and dropped back out of sight. The heat-beam flashed harmlessly up and struck the turret roof. Then across the turret window came a sheen of radiance--an electro-barrage. And behind it, Hahn's suave, evil face appeared. He shouted down:

"We have orders to spare you, Gregg Haljan--or you would have been killed long ago!"

My answering shot hit his barrage with a shower of

sparks, behind which he stood unmoved.

Carter handed me another weapon. "Gregg, try this."

I levelled the old explosive bullet projector; Carter crouched beside me. But before I could press the trigger, from somewhere down the starlit deck an electro-beam hit me. The little rifle exploded, burst its breech. I sank back to the floor, tingling from the shock of the hostile current. My hands were blackened from the exploding powder.

Carter seized me. "No use! Hurt?"

"No."

The stars through the dome-windows were swinging. A long swing--the shadows and starlit patches on the deck were all shifting. The Planetara was turning. The heavens revolved in a great round sweep of movement, then settled as we took our new course. Hahn at the turret controls had swung us. The earth and the sun showed over our bow quarter. The sunlight mingled red-yellow with the brilliant

starlight. Hahn's signals were sounding; I heard them answered from the mechanism rooms down below. Brigands there--in full control. The gravity plates were being set to the new positions; we were on our new course. Headed a point or two off the Earth-line. Not headed for the moon? I wondered.

Carter and I were planning nothing. What was there to plan? We were under observation. A Martian paralyzing ray--or electronic beam, far more deadly than our own puny police weapons--would have struck us the instant we tried to leave the chart-room.

My swift-running thoughts were interrupted by a shout from down the deck. At a corner of the cabin superstructure some fifty feet from our windows the figure of Miko appeared. A barrage-radiance hung around him like a shimmering mantle. His voice sounded:

"Gregg Haljan, do you yield?"

Carter leaped up from where he and I were crouching. Against all reason of safety he leaned from

the low window, waving his hamlike fist.

“Yield? No! I am in command here, you pirate! Brigand--murderer!”

I pushed him back. “Careful!”

He was spluttering, and over it Miko’s sardonic laugh sounded. “Very well--but you will talk? Shall we argue about it?”

I stood up. “What do you want to say, Miko?”

Behind him the tall, thin figure of his sister showed. She was plucking at him. He turned violently.

“I won’t hurt him! Gregg Haljan--is this a truce? You will not shoot?” He was shielding Moa.

“No,” I called. “For a moment, no. A truce. What is it you want to say?”

I could hear the babble of passengers who were herded in the cabin with brigands guarding them.

George Prince, bareheaded, but shrouded in his cloak, showed in a patch of light behind Moa. He looked my way and then retreated into the lounge archway.

Miko called, "You must yield. We want you, Haljan."

"No doubt," I jeered.

"Alive. It is easy to kill you."

I could not doubt that. Carter and I were little more than rats in a trap, here in the chart-room. But Miko wanted to take me alive: that was not so simple. He added persuasively:

"We want you to help us navigate. Will you?"

"No."

"Will you help us, Captain Carter? Tell your cub, this Haljan, to yield. You are fools. We understand that Haljan has been handling the ship's mathematics. Him we need most."

Carter roared: "Get back from there! This is no truce!"

I shoved aside his levelled bullet-projector. "Wait a minute!" I called to Miko. "Navigate--where?"

"Oh," he retorted, "that is our business, not yours. When you lay down your weapons and come out of there, I will give you the course."

"Back to the earth?" I suggested.

I could fancy him grinning behind the sheen of his barrage at my question.

"The earth? Yes--shall we go there? Give me your orders, Gregg Haljan. Of course I will obey them."

His sardonic words were interrupted. And I realized that all this parley was a ruse of Miko's to take me alive. He had made a gesture. Hahn, watching from the turret window, doubtless flashed a signal down to the hull-corridors. The magnetizer control under the chart-room was altered, our artificial gravity cut off. I

felt the sudden lightness; I gripped the window casement and clung. Carter was startled into incautious movement. It flung him out into the center of the chart-room, his arms and legs grotesquely flailing.

And across the chart-room, in the opposite window, I felt rather than saw the shape of something. A figure--almost invisible, but not quite--was trying to climb in! I flung the empty rifle I was holding. It hit something solid in the window; in a flare of sparks a black-hooded figure materialized. A man climbing in! His weapon spat. There was a tiny electronic flash, deadly silent. The intruder had shot at Carter; struck him. Carter gave one queer scream. He had floated to the floor; his convulsive movement when he was hit hurled him to the ceiling. His body struck, twitched; bounced back and sank inert on the floor-grid almost at my feet.

I clung to the casement. Across the space of the weightless room the hooded intruder was also clinging. His hood fell back. It was Johnson. He leered at me.

“Killed him, the bully! Well, he deserved it. Now for you, Mr. Third Officer Haljan!”

But he did not dare fire at me--Miko had forbidden it. I saw him reach under his robe, doubtless for a low-powered paralyzing ray such as Miko already had used on me. But he never got it out. I had no weapon within reach. I leaned into the room, still holding the casement, and doubled my legs under me. I kicked out from the window.

The force catapulted me across the space of the room like a volplane. I struck the purser. We gripped. Our locked, struggling bodies bounced out into the room. We struck the floor, surged up like balloons to the ceiling, struck it with a flailing arm or a leg and floated back.

Grotesque, abnormal combat! Like fighting in weightless water. Johnson clutched his weapon, but I twisted his wrist, held his arm outstretched so that he could not aim it. I was aware of Miko's voice shouting on the deck outside.

Johnson's left hand was gouging at my face, his fingers plucking at my eyes. We lunged down to the floor, then up again, close to the ceiling.

I twisted his wrists. He dropped the weapon and it sank away. I tried to reach it, but could not. Then I had him by the throat. I was stronger than he, and more agile. I tried choking him, his thick bull-neck within my fingers. He kicked, scrambled, tore and gouged at me. Tried to shout, but it ended in a gurgle. And then, as he felt his breath stopped, his hands came up in an effort to tear mine loose.

We sank again to the floor. We were momentarily upright. I felt my feet touch. I bent my knees. We sank further.

And then I kicked violently upward. Our locked bodies shot to the ceiling. Johnson's head was above me. It struck the steel roof of the chart-room. A violent blow. I felt him go suddenly limp. I cast him off, and, doubling my body, I kicked at the ceiling. It sent me diagonally downward to the window, where I clung and regained stability.

And I saw Miko standing on the deck with a weapon levelled at me!

Chapter 13 The Torture

“Haljan! Yield or I’ll fire! Moa, give me the smaller one. This cursed--”

He had in his hand too large a projector. Its ray would kill me. If he wanted to take me alive, he would not fire. I chanced it.

“No!”

I tried to draw myself beneath the window. An automatic bullet projector was on the floor where Carter had dropped it. I pulled myself down. Miko did not fire. I reached the revolver. The dead bodies of the captain and purser had drifted together on the floor in the center of the room.

I hitched myself back to the window. With upraised weapon I gazed cautiously out. Miko had disappeared. The deck within my line of vision was empty.

But was it? Something told me to beware. I clung to the casement, ready upon the instant to shove myself down. There was a movement in a shadow along the deck. Then a figure rose up.

“Don’t fire, Haljan!”

The sharp command, half appeal, stopped the pressure of my finger on the trigger of the automatic. It was the tall lanky Englishman, Sir Arthur Coniston, as he called himself. So he too was one of Miko’s band! The light through a dome-window fell full on him.

“If you fire, Haljan, and kill me--Miko will kill you then, surely.”

From where he had been crouching he could not command my window. But now, upon the heels of his placating words, he abruptly shot. The low-powered ray, had it struck, would have felled me without killing. But it went over my head as I dropped. Its aura made my senses reel.

Coniston shouted, "Haljan!"

I did not answer. I wondered if he would dare approach to see if I had been hit. A minute passed. Then another. I thought I heard Miko's voice on the deck outside. But it was an aerial, microscopic whisper close beside me.

"We see you, Haljan! You must yield!"

Their eavesdropping vibrations, with audible projection, were upon me. I retorted aloud.

"Come and get me! You cannot take me alive."

I do protest if this action of mine in the chart-room may seem bravado. I had no wish to die. There was within me a very healthy desire for life. But I felt, by holding out, that some chance might come wherewith I might turn events against these brigands. Yet reason told me it was hopeless. Our loyal members of the crew were killed, no doubt. Captain Carter and Balch were killed. The lookouts and Course-masters also. And Blackstone.

There remained only Dr. Frank and Snap. Their fate I did not yet know. And there was George Prince. He, perhaps, would help me if he could. But, at best, he was a dubious ally.

“You are very foolish, Haljan,” murmured the projection of Miko’s voice. And then I heard Coniston:

“See here, why would not a hundred pounds of gold-leaf tempt you? The code-words which were taken from Johnson--I mean to say, why not tell us where they are?”

So that was one of the brigands new difficulties! Snap had taken the code-word sheet, that time we sealed the purser in the cage.

I said, “You’ll never find them. And when a police ship sights us, what will you do then?”

The chances of a police ship were slim indeed, but the brigands evidently did not know that. I wondered again what had become of Snap. Was he captured--or still holding them off?

I was watching my windows; for at any moment, under cover of this talk, I might be assailed.

Gravity came suddenly to the room. Miko's voice said. "We mean well by you, Haljan. There is your normality. Join us. We need you to chart our course."

"And a hundred pounds of gold-leaf," urged Coniston. "Or more. Why, this treasure--"

I could hear an oath from Miko. And then his ironic voice: "We will not bother you, Haljan. There is no hurry. You will be hungry in good time. And sleepy. Then we will come and get you. And a little acid will make you think differently about helping us...."

His vibrations died away. The pull of gravity in the room was normal. I was alone in the dim silence, with the bodies of Carter and Johnson lying huddled on the grid. I bent to examine them. Both were dead.

My isolation was no ruse this time. The outlaws made no further attack. Half an hour passed. The deck outside, what I could see of it, was vacant. Balch lay

dead close outside the chart-room door. The bodies of Blackstone and the Course-master had been removed from the turret window. A forward lookout--one of Miko's men--was on duty in the nearby tower. Hahn was at the turret controls. The ship was under orderly handling, heading back upon a new course. For the Earth? Or the Moon? It did not seem so.

I found, in the chart-room, a Benson curve-light projector which poor Captain Carter had very nearly assembled. I worked on it, trained it through my rear window, along the empty deck; bent it into the lounge archway. Upon my grid the image of the lounge interior presently focused. The passengers in the lounge were huddled in a group. Disheveled, frightened, with Moa standing watching them. Stewards were serving them with a meal.

Upon a bench, bodies were lying. Some were dead. I saw Rance Rankin. Others were evidently only injured. Dr. Frank was moving among them, attending them. Venza was there, unharmed. And I saw the gamblers, Shac and Dud, sitting white-faced, whispering together. And Glutz's little be-ribboned,

be-curved figure on a stool.

George Prince was there, standing against the walls shrouded in his mourning cloak, watching the scene with alert, roving eyes. And by the opposite doorway, the huge towering figure of Miko stood on guard. But Snap was missing.

A brief glimpse. Miko saw my Benson-light. I could have equipped a heat-ray, and fired along the curved Benson-light into that lounge. But Miko gave me no time.

He slid the lounge door closed, and Moa leaped to close the one on my side. My light was cut off; my grid showed only the blank deck and door.

Another interval. I had made plans. Futile plans! I could get into the turret perhaps, and kill Hahn. I had the invisible cloak which Johnson was wearing. I took it from his body. Its mechanism could be repaired. Why, with it I could creep about the ship, kill these brigands one by one perhaps. George Prince would be with me. The brigands who had been posing as the

stewards and crew-members were unable to navigate; they would obey my orders. There were only Miko, Coniston and Hahn to kill.

Futile plans! From my window I could gaze up to the helio-room. And now abruptly I heard Snap's voice:

"No! I tell you--no!"

And Miko: "Very well. We will try this."

So Snap was captured, but not killed. Relief swept me. He was in the helio-room, and Miko was with him. But my relief was short-lived.

After a brief interval there came a moan from Snap. It floated down from the silence overhead. It made me shudder.

My Benson-beam shot into the helio window. It showed me Snap lying there on the floor. He was bound with wire. His torso had been stripped. His livid face was ghastly plain in my light.

Miko was bending over him. Miko with a heat-cylinder no longer than a finger. Its needle-beam played upon Snap's naked chest. I could see the gruesome little trail of smoke rising; and as Snap twisted and jerked, there on his flesh was the red and blistered trail of the violet-hot ray.

"Now will you tell?"

"No!"

Miko laughed. "No? Then I shall write my name a little deeper...."

A black scar now--a trail etched in the quivering flesh.

"Oh!--" Snap's face went white as chalk as he pressed his lips together.

"Or a little acid? This fire-writing does not really hurt? Tell me what you did with those code-words!"

"No!"

In his absorption Miko did not notice my light. Nor did I have the wit to try and fire along it. I was trembling. Snap under torture!

As the beam went deeper, Snap suddenly screamed. But he ended, “No! I will send--no message for you--”

It had been only a moment. In the chart-room window beside me again a figure appeared! No image. A solid, living person, undisguised by any cloak of invisibility. George Prince had chanced my fire and had crept up upon me.

“Haljan! Don’t attack me.”

I dropped my light connections. As impulsively I stood up, I saw through the window the figure of Coniston on the deck watching the result of Prince’s venture.

“Haljan--yield.”

Prince no more than whispered it. He stood outside on the deck; the low window casement touched his

waist. He leaned over it.

“He’s torturing Snap! Call out that you will yield.”

The thought had already been in my mind. Another scream from Snap chilled me with horror. I shouted,

“Miko! Stop!”

I rushed to the window and Prince gripped me.

“Louder!”

I called louder. “*Miko!* Stop!” My upflung voice mingled with Snap’s agony of protest. Then Miko heard me. His head and shoulders showed up there at the helio-room oval.

“You, Haljan?”

Prince shouted, “I have made him yield. He will obey you if you stop that torture.”

I think that poor Snap must have fainted. He was silent. I called, “Stop! I will do what you command.”

Miko jeered, "That is good. A bargain, if you and Dean obey me. Disarm him, Prince, and bring him out."

Miko moved back into the helio-room. On the deck Coniston was advancing, but cautiously, mistrustful of me.

"Gregg."

George Prince flung a leg over the casement and leaped lightly into the dim chart-room. His small slender figure stood beside me, clung to me.

"Gregg."

A moment, while we stood there together. No ray was upon us. Coniston could not see us, nor could he hear our whispers.

"Gregg."

A different voice; its throaty, husky quality gone. A soft pleading. "Gregg--

“Gregg, don’t you know me? Gregg, dear....”

Why, what was this? Not George Prince? A masquerader, yet so like George Prince.

“Gregg, don’t you know me?”

Clinging to me. A soft touch upon my arm. Fingers, clinging. A surge of warm, tingling current was flowing between us.

My sweep of instant thoughts. A speck of human Earth-dust, falling free. That was George Prince, who had been killed. George Prince’s body, disguised by the scheming Carter and Dr. Frank, buried in the guise of his sister. And this black-robed figure who was trying to help us--

“Anita! Dear God! Anita, darling! Anita!”

“Gregg, dear one!”

“Anita! Dear God!”

My arms went around her, my lips pressed hers, and felt her tremulous, eager answer.

“Gregg, dear.”

“Anita, you!”

The form of Coniston showed at our window. She cast me off. She said, with her throaty swagger of assumed masculinity:

“I have him, Sir Arthur. He will obey us.”

I sensed her warning glance. She shoved me toward the window. She said ironically, “Have no fear, Haljan. You will not be tortured, you and Dean, if you obey our commands.”

Coniston gripped me. “You fool! You caused us a lot of trouble, didn’t you? Move along there!”

He jerked me roughly through the window. Marched me the length of the deck. Out to the stern-space; opened the door of my cubby; flung me in and sealed

the door upon me.

“Miko will come presently.”

I stood in the darkness of my tiny room, listening to his retreating footsteps. But my mind was not on him....

All the Universe in that instant had changed for me. Anita was alive!

Part 2

My name, Gregg Haljan. My age, twenty-five years. My occupation, at the time my narrative begins, in 2075, was third officer of the Interplanetary Spaceship *Planetara*.

Thus I introduce myself to you. For this is a continuation of the book of Gregg Haljan, and of necessity I am the chief actor therein. I shall recapitulate very briefly what has happened so far:

Unscrupulous Martian brigands were scheming for

Johnny Grantline's secret radium-ore treasure, dug out of the Moon and waiting there to be picked up by the *Planetara* on her return trip from Mars.

The *Planetara* left, bound for Mars, some ten days away. Suspicious interplanetary passengers were aboard: Miko and Moa, a brother and a sister of Mars; Sir Arthur Coniston, a mysterious Englishman; Ob Hahn, a Venus mystic. And small, effeminate George Prince and his sister, Anita. Love, I think, was born instantly between Anita and me. I found all too soon that Miko, the sinister giant from Mars, also desired her.

As we neared the Moon we received Grantline's secret message: "Stop for ore on your return voyage. Success beyond wildest hopes!" But I soon discovered that an eavesdropper in an invisible cloak had overheard it!

Soon afterwards Miko accidentally murdered a person identified as Anita Prince.

Then, in the confusion that resulted, Miko struck his great blow. The crew of the *Planetara*, secretly in his pay, rose up and killed the captain and all the officers but Snap Dean, the radio-helio operator, and myself.

I was besieged in the chart-room. George Prince leaped in upon me—and put his arms around me. I looked at him closer—only to discover it was Anita, disguised as her brother! It was her brother, George, who had been killed! George had been in the brigands' confidence—thus Anita was able to spy for us.

Quickly we plotted. I would surrender to her, Anita Prince, whom the brigands thought was George Prince. Together we might possibly be able, with Snap's help, to turn the tide, and reclaim the *Planetara*.

I was taken to my stateroom and locked there until Miko the brigand leader should come to dispose of

me. But I cared not what had happened—Anita was alive!

Chapter 14 The Brigand Leader

The giant Miko stood confronting me. He slid my cubby door closed behind him. He stood with his head towering close against my ceiling. His cloak was discarded. In his leather clothes, and with his clanking sword-ornament, his aspect carried the swagger of a brigand of old. He was bareheaded; the light from one of my tubes fell upon his grinning, leering gray face.

"So, Gregg Haljan? You have come to your senses at last. You do not wish me to write my name upon your chest? I would not have done that to Dean; he forced me. Sit back."

I had been on my bunk. I sank back at the gesture of his huge hairy arm. His forearm was bare now; the sear of a burn on it was plain to be seen. He remarked my gaze.

"True. You did that, Haljan, in Great-New York. But I bear you no malice. I want to talk to you now."

He cast about for a seat, and took the little stool which stood by my desk. His hand held a small cylinder of the Martian paralyzing ray; he rested it beside him on the desk.

"Now we can talk."

I remained silent. Alert. Yet my thoughts were whirling. Anita was alive. Masquerading now as her brother. And, with the joy of it, came a shudder. Above everything, Miko must not know.

"A great adventure we are upon, Haljan."

My thoughts came back. Miko was talking with an assumption of friendly comradeship. "All is well—and we need you, as I have said before. I am no fool. I have been aware of everything that went on aboard this ship. You, of all the officers, are most clever at the routine mathematics. Is that so?"

"Perhaps," I said.

"You are modest." He fumbled at a pocket of his

jacket, produced a scroll-sheaf. I recognized it: Blackstone's figures; the calculation Blackstone roughly made of the elements of the asteroid we had passed.

"I am interested in these," Miko went on. "I want you to verify them. And this." He held up another scroll. "This is the calculation of our present position. And our course. Hahn claims he is a navigator. We have set the ship's gravity plates—see, like this—"

He handed me the scrolls; he watched me keenly as I glanced over them.

"Well?" I said.

"You are sparing of words, Haljan. By the devils of the airways, I could make you talk! But I want to be friendly."

I handed him back the scrolls. I stood up; I was almost within reach of his weapon, but with a sweep of his great arm he abruptly knocked me back to my bunk.

"You dare?" Then he smiled. "Let us not come to blows!"

"No," I said. I returned his smile. In truth, physical violence could get me nothing in dealing with this fellow. I would have to try guile. And I saw now that his face was flushed and his eyes unnaturally bright. He had been drinking alcolite; not enough to befuddle him—but enough to make him triumphantly talkative.

"Hahn may not be much of a mathematician," I suggested. "But there is your Sir Arthur Coniston." I managed a sarcastic grin. "Is that his name?"

"Almost. Haljan, will you verify these figures?"

"Yes. But why? Where are we going?"

He laughed. "You are afraid I will not tell you! Why should I not? This great adventure of mine is progressing perfectly. A tremendous stake, Haljan. A hundred millions of dollars in gold-leaf; there will be fabulous riches for us all, when that radium ore is sold for a hundred million in gold-leaf."

"But where are we going?"

"To that asteroid," he said abruptly. "I must get rid of these passengers. I am no murderer."

With half a dozen killings in the recent fight this was hardly convincing. But he was obviously wholly serious. He seemed to read my thoughts.

"I kill only when necessary. We will land upon the asteroid. A perfect place to maroon the passengers. Is it not so? I will give them the necessities of life. They will be able to signal. And in a month or so, when we are safely finished with our adventure, a police ship no doubt will rescue them."

"And then, from the asteroid," I suggested, "we are going—"

"To the Moon, Haljan. What a clever guesser you are! Coniston and Hahn are calculating our course. But I have no great confidence in them. And so I want you."

"You have me."

"Yes. I have you. I would have killed you long ago—I am an impulsive fellow—but my sister restrained me."

He gazed at me slyly. "Moa seems strangely to like you, Haljan."

"Thanks," I said. "I'm flattered."

"She still hopes I may really win you to join us," he went on. "Gold-leaf is a wonderful thing; there would be plenty for you in this affair. And to be rich, and have the love of a woman like Moa...."

He paused. I was trying cautiously to gauge him, to get from him all the information I could. I said, with another smile, "That is premature, to talk of Moa. I will help you chart your course. But this venture, as you call it, is dangerous. A police-ship—"

"There are not many," he declared. "The chances of us encountering one is very slim." He grinned at me. "You know that as well as I do. And we now have those code pass-words—I forced Dean to tell me where he had hidden them. If we should be

challenged, our pass-word answer will relieve suspicion."

"The *Planetara*," I objected, "being overdue at Ferrok-Shahn, will cause alarm. You'll have a covey of patrol-ships after you."

"That will be two weeks from now," he smiled. "I have a ship of my own in Ferrok-Shahn. It lies there waiting now, manned and armed. I am hoping that, with Dean's help, we may be able to flash it a signal. It will join us on the Moon. Fear not for the danger, Haljan. I have great interests allied with me in this thing. Plenty of money. We have planned carefully."

He was idly fingering his cylinder; his gaze roved me as I sat docile on my bunk. "Did you think George Prince was a leader of this? A mere boy. I engaged him a year ago—his knowledge of ores is valuable."

My heart was pounding, but I strove not to show it. He went on calmly.

"I told you I am impulsive. Half a dozen times I have

nearly killed George Prince, and he knows it." He frowned. "I wish I had killed him, instead of his sister. That was an error."

There was a note of real concern in his voice. Did he love Anita Prince? It seemed so.

He added, "That is done—nothing can change it. George Prince is helpful to me. Your friend Dean is another. I had trouble with him, but he is docile now."

I said abruptly, "I don't know whether your promise means anything or not, Miko. But George Prince said you would use no more torture."

"I won't. Not if you and Dean obey me."

"You tell Dean I have agreed to that. You say he gave you the code-words we took from Johnson?"

"Yes. There was a fool! That Johnson! You blame me, Haljan, for the killing of Captain Carter? You need not. Johnson offered to try and capture you. Take you alive. He killed Carter because he was angry at him. A

stupid, vengeful fool! He is dead, and I am glad of it."

My mind was on Miko's plans. I ventured. "This treasure on the Moon—did you say it was on the Moon?"

"Don't be an idiot," he retorted. "I know as much about Grantline as you do."

"That's very little."

"Perhaps."

"Perhaps you know more, Miko. The Moon is a big place. Where, for instance, is Grantline located?"

I held my breath. Would he tell me that? A score of questions—vague plans—were in my mind. How skilled at mathematics were these brigands? Miko, Hahn, Coniston—could I fool them? If I could learn Grantline's location on the Moon, and keep the *Planetara* away from it. A pretended error of charting. Time lost—and perhaps Snap could find an opportunity to signal Earth, get help.

Miko answered my question as bluntly as I asked it. "I don't know where Grantline is located. But we will find out. He will not suspect the *Planetara*. When we get close to the Moon, we will signal and ask him. We can trick him into telling us. You think I do not know what is on your mind, Haljan? There is a secret code of signals arranged between Dean and Grantline. I have forced Dean to confess it. Without torture! Prince helped me in that. He persuaded Dean not to defy me. A very persuasive fellow, George Prince. More diplomatic than I am, I give him credit."

I strove to hold my voice calm. "If I should join you, Miko—my word, if I ever gave it, you would find dependable—I would say George Prince is very valuable to us. You should rein your temper. He is half your size—you might some time, without intention do him injury."

He laughed. "Moa says so. But have no fear—"

"I was thinking," I persisted, "I'd like to have a talk with George Prince."

Ah, my pounding, tumultuous heart! But I was smiling calmly. And I tried to put into my voice a shrewd note of cupidity. "I really know very little about this treasure, Miko. If there were a million or two of gold-leaf in it for me—"

"Perhaps there would be."

"I was thinking. Suppose you let me have a talk with Prince? I have some knowledge of radium ores. His skill and mine—a calculation of what Grantline's treasure may really be. You don't know; you are only assuming."

I paused. Whatever may have been in Miko's mind I cannot say. But abruptly he stood up. I had left my bunk, but he waved me back.

"Sit down. I am not like Moa. I would not trust you just because you protested you would be loyal." He picked up his cylinder. "We will talk again." He gestured to the scrolls he had left upon my desk. "Work on those. I will judge you by the results."

He was no fool, this brigand leader.

"Yes," I agreed. "You want a true course now to the asteroid?"

"Yes. I will get rid of these passengers. Then we will plan further. Do your best, Haljan—no error! By the Gods, I warn you I can check up on you!"

I said meekly, "Very well. But you ask Prince if he wants my calculations of Grantline's ore-body."

I shot Miko a foxy look as he stood by my door. I added, "You think you are clever. There is plenty you don't know. Our first night out from the Earth—Grantline's signals—didn't it ever occur to you that I might have some figures on his treasure?"

It startled him. "Where are they?"

I tapped my forehead. "You don't suppose I was foolish enough to record them. You ask Prince if he wants to talk to me. A high thorium content in ore—you ask Prince. A hundred millions, or two hundred. It

would make a big difference, Miko."

"I will think about it." He backed out and sealed the door upon me once again.

But Anita did not come. I verified Hahn's figures, which were very nearly correct. I charted a course for the asteroid; it was almost the one which had been set.

Coniston came for my results. "I say, we are not so bad as navigators, are we? I think we're jolly good, considering our inexperience. Not bad at all, eh?"

"No."

I did not think it wise to ask him about Prince.

"Are you hungry, Haljan?" he demanded.

"Yes."

A steward came with a meal. The saturnine Hahn stood at my door with a weapon upon me while I ate.

They were taking no chances—and they were wise not to.

The day passed. Day and night, all the same of aspect here in the starry vault of Space. But with the ship's routine it was day.

And then another time of sleep. I slept, fitfully, worrying, trying to plan. Within a few hours we would be nearing the asteroid.

The time of sleep was nearly passed. My chronometer marked five A. M. of our original Earth starting time. The seal of my cubby door hissed. The door slowly, opened.

Anita!

She stood there with her cloak around her. A distance away on the shadowed deck-space Coniston was loitering.

"Anita!" I whispered it.

"Gregg, dear!"

She turned and gestured to the watching brigand. "I will not be long, Coniston."

She came in and half closed the door upon us, leaving it open enough so that we could make sure that Coniston did not advance.

I stepped back where he could not see us.

"Anita!"

She flung herself into my opened arms.

Chapter 15 The Masquerader

A moment when beyond all thought of the nearby brigand—or the possibility of an eavesdropping ray trained now upon my little cubby—a moment while Anita and I held each other; and whispered those things which could mean nothing to the world, but which were all the world to us.

Then it was she whose wits brought us back from the shining fairyland of our love, into the sinister reality of the *Planetara*.

"Gregg, if they are listening—"

I pushed her away. This brave little masquerader! Not for my life, or for all the lives on the ship, would I consciously have endangered her.

"But the ore," I said aloud. "There was, in Grantline's message—See here, Prince."

Coniston was too far away on the deck to hear us. Anita went to my door again and waved at him reassuringly. I put my ear to the door opening, and listened at the space across the grid of the ventilator over my bunk. The hum of a vibration would have been audible at those two points. But there was nothing.

"It's all right," I whispered. "Anita—not you who was killed! I can hardly realize it now. Not you whom they buried yesterday morning."

We stood and whispered, and she clung to me—so small beside me. With the black robe thrown aside, it seemed that I could not miss the curves of her woman's figure. A dangerous game she was playing. Her hair had been cut short to the base of her neck, in the fashion of her dead brother. Her eyelashes had been clipped; the line of her brows altered. And now, in the light of my ray tube as it shone upon her earnest face, I could remark other changes. Glutz, the little beauty specialist, was in this secret. With plastic skill he had altered the set of her jaw with his wax—put masculinity there.

She was whispering: "It was—was poor George whom Miko shot."

I had now the true version of what had occurred. Miko had been forcing his wooing upon Anita. George Prince was a weakling whose only good quality was a love for his sister. Some years ago he had fallen into evil ways. Been arrested, and then discharged from his position with the Federated Radium Corporation. He had taken up with evil companions in Great-New York. Mostly Martians. And Miko had met him. His

technical knowledge, his training with the Federated Corporation, made him valuable to Miko's enterprise. And so Prince had joined the brigands.

Of all this, Anita had been unaware. She had never liked Miko. Feared him. And it seemed that the Martian had some hold upon her brother, which puzzled and frightened Anita.

Then Miko had fallen in love with her. George had not liked it. And that night on the *Planetara*, Miko had come and knocked upon Anita's door. Incautiously she opened it; he forced himself in. And when she repulsed him, struggled with him, George had been awakened.

She was whispering to me now. "My room was dark. We were all three struggling. George was holding me—the shot came—and I screamed."

And Miko had fled, not knowing whom his shot had hit in the darkness.

"And when George died, Captain Carter wanted me to

impersonate him. We planned it with Dr. Frank, to try and learn what Miko and the others were doing. Because I never knew that poor George had fallen into such evil things."

I could only hold her thankfully in my arms. The lost what-might-have-been seemed coming back to us.

"And they cut my hair, Gregg, and Glutz altered my face a little, and I did my best. But there was no time—it came upon us so quickly."

And she whispered, "But I love you, Gregg. I want to be the first to say it: I love you—I love you."

But we had the sanity to try and plan.

"Anita, when you go back, tell Miko we discussed radium ores. You'll have to be careful, clever. Don't say too much. Tell him we estimate the treasure at a hundred and thirty millions."

I told her what Miko had vouchsafed me of his plans. She knew all that. And Snap knew it. She had had a

few moments alone with Snap. Gave me now a message from him:

"We'll pull out of this, Gregg."

With Snap she had worked out a plan. There were Snap and I; and Shac and Dud Ardley, upon whom we could doubtless depend. And Dr. Frank. Against us were Miko and his sister; and Coniston and Hahn. Of course there were the members of the crew. But we were numerically the stronger when it came to true leadership. Unarmed and guarded now. But if we could break loose—recapture the ship....

I sat listening to Anita's eager whispers. It seemed feasible. Miko did not altogether trust George Prince; Anita was now unarmed.

"But I can make opportunity! I can get one of their ray cylinders, and an invisible cloak equipment."

That cloak—it had been hidden in Miko's room when Carter searched for it in A20—was now in the chart-room by Johnson's body. It had been repaired now;

Anita thought she could get possession of it.

We worked out the details of the plan. Anita would arm herself, and come and release me. Together, with a paralyzing ray, we could creep aboard the ship, overcome these brigands one by one. There were so few of the leaders. With them felled, and with us in control of the turret and the helio-room we could force the crew to stay at their posts. There were, Anita said, no navigators among Miko's crew. They would not dare oppose us.

"But it should be done at once, Anita. In a few hours we will be at the asteroid."

"Yes. I will go now—try and get the weapons."

"Where is Snap?"

"Still in the helio-room. One of the crew guards him."

Coniston was roaming the ship; he was still loitering on the deck, watching our door. Hahn was in the turret. The morning watch of the crew were at their

posts in the hull-corridors; the stewards were preparing a morning meal. There were nine members of subordinates altogether, Anita had calculated. Six of them were in Miko's pay; the other three—our own men who had not been killed in the fighting—had joined the brigands.

"And Dr. Frank, Anita?"

He was in the lounge. All the passengers were herded there, with Miko and Moa alternating on guard.

"I will arrange it with Venza," Anita whispered swiftly. "She will tell the others. Dr. Frank knows about it now. He thinks it can be done."

The possibility of it swept me anew. The brigands were of necessity scattered singly about the ship. One by one, creeping under cover of an invisible cloak, I could fell them, and replace them without alarming the others. My thoughts leaped to it. We would strike down the guard in the helio-room. Release Snap. At the turret we could assail Hahn, and replace him with Snap.

Coniston's voice outside broke in upon us. "Prince."

He was coming forward. Anita stood in the doorway. "I have the figures, Coniston. By God, this Haljan is with us! And clever! We think it will total a hundred and thirty millions. What a stake!"

She whispered, "Gregg, dear—I'll be back soon. We can do it—be ready."

"Anita—be careful of yourself! If they should suspect you...."

"I'll be careful. In an hour, Gregg, or less, I'll come back. All right, Coniston. Where is Miko? I want to see him. Stay where you are, Haljan! All in good time Miko will trust you with your liberty. You'll be rich like us all, never fear."

She swaggered out upon the deck, waved at the brigand, and banged my cubby door in my face.

I sat upon my bunk. Waiting. Would she come back? Would she be successful?

Chapter 16 In the Blue-lit Corridor

She came. I suppose it was no more than an hour: it seemed an eternity of apprehension. There was the slight hissing of the seal of my door. The panel slid. I had leaped from my bunk where in the darkness I was lying tense.

"Prince?" I did not dare say, "Anita."

"Gregg."

Her voice. My gaze swept the deck as the panel opened. Neither Coniston nor anyone else was in sight, save Anita's dark-robed figure which came into my room.

"You got it?" I asked her in a low whisper.

I held her for an instant, kissed her. But she pushed me away with quick hands.

"Gregg, dear—"

She was breathless. My kisses, and the tenseness of what lay before us were to blame.

"Gregg, see, I have it. Give us a little light—we must hurry!"

In the blue dimness I saw that she was holding one of the Martian cylinders. The smallest size; it would paralyze, but not kill.

"Only one, Anita?"

"Yes. I had it before, but Miko took it from me. It was in his room. And this—"

The invisible cloak. We laid it on my grid, and I adjusted its mechanism. A cloak of the reflecting-absorbing variety.*

*[The principle of this invisible cloak involves the use of an electronized fabric. All color is absorbed. The light rays reflected to the eye of the observer thus show an image of empty blackness. There is also created about the cloak a magnetic field which by

natural laws bends the rays of light from objects behind it. This principle of the natural bending of light when passing through a magnetic field was first recognized by Albert Einstein, a scientist of the Twentieth century. In the case of this invisible cloak, the bending light rays, by making visible what was behind the cloak's blackness, thus destroyed its solid black outline and gave a pseudo-invisibility which was fairly effective under favorable conditions.]

I donned it, and drew its hood, and threw on its current.

"All right, Anita?"

"Yes."

"Can you see me?"

"No." She stepped back a foot or two further. "Not from here. But you must let no one approach too close."

Then she came forward, put out her hand, fumbled

until she found me.

It was our plan to have me follow her out. Anyone observing us would see only the robed figure of the supposed George Prince, and I would escape notice.

The situation about the ship was almost unchanged. Anita had secured the weapon and the cloak and slipped away to my cubby without being observed.

"You're sure of that?"

"I think so, Gregg. I was careful."

Moa was now in the lounge, guarding the passengers. Hahn was asleep in the chart-room; Coniston was in the turret. Coniston would be off duty presently, Anita said, with Hahn taking his place. There were look-outs in the forward and stern watch-towers, and a guard upon Snap in the helio-room.

"Is he inside the room, Anita?"

"Snap? Yes."

"No—the guard."

"No. He was sitting upon the spider bridge at the door."

This was unfortunate. That guard could see all the deck clearly. He might be suspicious of George Prince wandering around; it would be difficult to get near enough to assail him. This cylinder, I knew, had an effective range of only some twenty feet.

Anita and I were swiftly whispering. It was necessary now to decide exactly what we were to do; once under observation outside, there must be no hesitation, no fumbling.

"Coniston is sharpest, Gregg. He will be the hardest to get near."

The languid-spoken Englishman was the one Anita most feared. His alert eyes seemed to miss nothing. Perhaps he was suspicious of this George Prince—Anita thought so.

"But where is Miko?" I whispered.

The brigand leader had gone below a few moments ago, down into the hull-corridor. Anita had seized the opportunity to come to me.

"We can attack Hahn in the chart-room first," I suggested. "And get the other weapons. Are they still there?"

"Yes. But Gregg, the forward deck is very bright."

We were approaching the asteroid. Already its light like a brilliant moon was brightening the forward deck-space. It made me realize how much haste was necessary.

We decided to go down into the hull-corridors. Locate Miko. Fell him, and hide him. His non-appearance back on deck would very soon throw the others into confusion, especially now with our impending landing upon the asteroid. And under cover of this confusion we would try and release Snap.

We had been arguing no more than a minute or two. We were ready. Anita slid my door wide. She stepped through, with me soundlessly scurrying after her. The empty, silent deck was alternately dark with shadow-patches and bright with blobs of starlight. A sheen of the Sun's corona was mingled with it; and from forward came the radiance of the asteroid's mellow silver glow.

Anita turned to seal my door; within my faintly humming cloak I stood beside her. Was I invisible in this light? Almost directly over us, close under the dome, the look-out sat in his little tower. He gazed down at Anita.

Amidships, high over the cabin superstructure, the helio-room hung dark and silent. The guard on its bridge was visible. He, too, looked down.

A tense instant. Then I breathed again. There was no alarm. The two guards answered Anita's gesture.

Anita said aloud into my empty cubby: "Miko will come for you presently, Haljan. He told me to tell you

that he wants you at the turret controls to land us on the asteroid."

She finished sealing my door and turned away; started forward along the deck. I followed. My steps were soundless in my elastic-bottomed shoes. Anita swaggered with a noisy tread. Near the door of the smoking room a small incline passage led downward. We went into it.

The passage was dimly blue-lit. We descended its length, came to the main corridor, which ran the length of the hull. A vaulted metal passage, with doors to the control rooms opening from it. Dim lights showed at intervals.

The humming of the ship was more apparent here. It drowned the slight humming of my cloak. I crept after Anita; my hand under the cloak clutched the ray weapon.

A steward passed us. I shrank aside to avoid him.

Anita spoke to him. "Where is Miko, Ellis?"

"In the ventilator-room, Mr. Prince. There was difficulty with the air renewal."

Anita nodded, and moved on. I could have felled that steward as he passed me. Oh, if I only had, how different things might have been!

But it seemed needless. I let him go, and he turned into a nearby door which led to the galley.

Anita moved forward. If we could come upon Miko alone. Abruptly she turned, and whispered, "Gregg, if other men are with him, I'll draw him away. You watch your chance."

What little things may overthrow one's careful plans! Anita had not realized how close to her I was following. And her turning so unexpectedly caused me to collide with her sharply.

"Oh!" She exclaimed it involuntarily. Her outflung hand had unwittingly gripped my wrist, caught the electrode there. The touch burned her, and close-circuited my robe. There was a hiss. My current

burned out the tiny fuses.

My invisibility was gone! I stood, a tall black-hooded figure, revealed to the gaze of anyone who might be near!

The futile plans of humans! We had planned so carefully! Our calculations, our hopes of what we could do, came clattering now in a sudden wreckage around us.

"Anita, run!"

If I were seen with her, then her own disguise would probably be discovered. That above everything would be disaster!

"Anita, get away from me! I must try it alone!"

I could hide somewhere, repair the cloak perhaps. Or, since now I was armed, why could I not boldly start an assault?

"Gregg, we must get you back to your cubby!" She

was clinging to me in a panic.

"No! You run! Get away from me! Don't you understand? George Prince has no business here with me! They'd kill you!"

Or worse— Miko would discover it was Anita, not George Prince.

"Gregg, let's get back to the deck."

I pushed at her. Both of us in sudden confusion.

From behind me there came a shout. That accursed steward! He had returned, to investigate perhaps what George Prince was doing in this corridor. He heard our voices; his shout in the silence of the ship sounded horribly loud. The white-clothed shape of him was in the nearby doorway. He stood stricken in surprise at seeing me. And then turned to run.

I fired my paralyzing cylinder through my cloak. Got him! He fell. I shoved Anita violently.

"Run! Tell Miko to come—tell him you heard a shout! He won't suspect you!"

"But Gregg—"

"You mustn't be found out! You're our only hope, Anita! I'll hide, fix the cloak, or get back to my cubby. We'll try it again."

It decided her. She scurried down the corridor. I whirled the other way. The steward's shout might not have been heard.

Then realization flashed to me. That steward would be revived. He was one of Miko's men: for two voyages he had been a spy upon the *Planetara*. He would be revived and tell what he had seen and heard. Anita's disguise would be revealed.

A cold-blooded killing I do protest went against me. But it was necessary. I flung myself upon him. I beat his skull with the metal of my cylinder.

I stood up. My hood had fallen back from my head. I

wiped my bloody hands on my useless cloak. I had smashed the cylinder.

"Haljan!"

Anita's voice! A sharp note of horror and warning. I became aware that in the corridor, forty feet down its dim length, Miko had appeared, with Anita behind him. His rifle-bullet-projector was leveled. It spat at me. But Anita had pulled at his arm.

The explosive report was sharply deafening in the confined space of the corridor. With a spurt of flame the leaden pellet struck over my head against the vaulted ceiling.

Miko was struggling with Anita. "Prince, you idiot!"

"Miko, don't! It's Haljan! Don't kill him—"

The turmoil brought members of the crew. From the shadowed oval near me they came running. I flung the useless cylinder at them. But I was trapped in the narrow passage.

I might have fought my way out. Or Miko might have shot me. But there was the danger that, in her horror, Anita would betray herself.

I backed against the wall. "Don't kill me! See, I will not fight!"

I flung up my arms. And the crew, emboldened, and courageous under Miko's gaze, leaped on me and bore me down.

The futile plans of humans! Anita and I had planned so carefully, and in a few brief minutes of action it had come only to this!

Chapter 17 A Woman of Mars

"So, Gregg Haljan, you are not as loyal as you pretend!"

Miko was livid with suppressed anger. They had stripped the cloak from me, and flung me back in my cubby. Miko was now confronting me; at the door Moa stood watching. And Anita was behind her. I sat

outwardly defiant and sullen on my bunk. But I was alert and tense, fearful still of what Anita's emotion might betray her into doing.

"Not so loyal," Miko repeated. "And a fool! Do you think I am such a child you can escape me!"

He swung around. "How did he get out of here? Prince, you came in here!"

My heart was wildly thumping. But Anita retorted with a touch of spirit:

"I came to tell him what you commanded. To check Hahn's latest figures—and to be ready to take the controls when we go into the asteroid's atmosphere."

"Well, how did he get out?"

"How should I know?" she parried. Little actress! Her spirit helped to allay my fear. She held her cloak close around her in the fashion they had come to expect from the George Prince who had just buried his sister. "How should I know, Miko? I sealed his door."

"But did you?"

"Of course he did," Moa put in.

"Ask your look-outs," said Anita. "They saw me—I waved to them just as I sealed the door."

I ventured, "I have been taught to open doors." I managed a sly, lugubrious smile. "I shall not try it again, Miko."

Nothing had been said about my killing of the steward. I thanked my constellations now that he was dead. "I shall not try it again," I repeated.

A glance passed between Miko and his sister. Miko said abruptly, "You seem to realize that it is not my purpose to kill you. And you presume upon it."

"I shall not again." I eyed Moa. She was gazing at me steadily. She said, "Leave me with him, Miko...." She smiled. "Gregg Haljan, we are no more than twenty thousand miles from the asteroid now. The calculations for retarding are now in operation."

It was what had taken Miko below, that and trouble with the ventilating system, which was soon rectified. But the retarding of the ship's velocity when nearing a destination required accurate manipulation. These brigands were fearful of their own skill. That was obvious. It gave me confidence. I was really needed. They would not harm me. Except for Miko's impulsive temper, I was in no danger from them—not now, certainly.

Moa was saying, "I think I may make you understand, Gregg. We have tremendous riches within our grasp."

"I know it," I added with sudden thought. "But there are many with whom to divide this treasure...."

Miko caught my intended implication. "By the infernal, this fellow may have felt he could seize the treasure for himself! Because he is a navigator!"

Moa said vehemently, "Do not be an idiot, Gregg! You could not do it! There will be fighting with Grantline."

My purpose was accomplished. They seemed to see

me a willing outlaw like themselves. As though it were a bond between us. And they could win me.

"Leave me with him," said Moa.

Miko acquiesced. "For a few minutes only." He proffered a heat-ray cylinder, but she refused it.

"I am not afraid of him."

Miko swung on me. "Within an hour we will be nearing the atmosphere. Will you take the controls?"

"Yes."

He set his heavy jaw. His eyes bored into me. "You're a strange fellow, Haljan. I can't make you out. I am not angry now. Do you think, when I am deadly serious, that I mean what I say?"

His calm words set a sudden shiver over me. I checked my smile.

"Yes," I said.

"Well then, I will tell you this: not for all of Prince's well-meaning interference, or Moa's liking for you, or my own need of your skill, will I tolerate more trouble from you. The next time—I will kill you. Do you believe me?"

"Yes."

"That is all I want to say. You kill my men, and my sister says I must not hurt you. I am not a child to be ruled by a woman!"

He held his huge fist before my face. "With these fingers I will twist your neck! Do you believe it?"

"Yes." I did indeed.

He swung on his heel. "If Moa wants to try and put sense into your head—I hope she does. Bring him to the lounge when you are finished, Moa. Come, Prince—Hahn will need us." He chuckled grimly. "Hahn seems to fear we will plunge into this asteroid like a wild comet gone suddenly tangent!"

Anita moved aside to let him through the door. I caught a glimpse of her set white face as she followed him down the deck.

Then Moa's bulk blocked the doorway. She faced me.

"Sit where you are, Gregg." She turned and closed the door upon us. "I am not afraid of you. Should I be?"

"No," I said.

She came and sat down beside me. "If you should attempt to leave this room, the stern look-out has orders to bore you through."

"I have no intention of leaving the room," I retorted. "I do not want to commit suicide."

"I thought you did. You seem minded in such a fashion. Gregg, why are you so foolish?"

I remained silent.

"Why?" she demanded.

I said carefully, "This treasure—you are many who will divide it. You have all these men on the *Planetara*. And in Ferrok-Shahn, others, no doubt."

I paused. Would she tell me? Could I make her talk of that other brigand ship which Miko had said was waiting on Mars? I wondered if he had been able to signal it. The distance from here to Mars was great; yet upon other voyages Snap's signals had gotten through. My heart sank at the thought. Our situation here was desperate enough. The passengers soon would be cast upon the asteroid: there would be left only Snap, Anita and myself. We might recapture the ship, but I doubted it now. My thoughts were turning to our arrival upon the Moon. We three might, perhaps, be able to thwart the attack upon Grantline, hold the brigands off until help from the Earth might come.

But with another brigand ship, fully manned and armed, coming from Mars, the condition would be immeasurably worse. Grantline had some twenty men, and his camp, I knew, would be reasonably fortified. I knew, too, that Johnny Grantline would

fight to his last man.

Moa was saying, "I would like to tell you our plans, Gregg."

Her gaze was on my face. Keen eyes, but they were luminous now—an emotion in them sweeping her. But outwardly she was calm, stern-lipped.

"Well, why don't you tell me?" I said. "If I am to help you...."

"Gregg, I want you with us. Don't you understand? We are not many. My brother and I are guiding this affair. With your help, I would feel differently."

"The ship at Ferrok-Shahn—"

My fears were realized. She said, "I think our signals reached it. Dean tried, and Coniston was checking him."

"You think the ship is coming?"

"Yes."

"Where will it join us?"

"At the Moon. We will be there in thirty hours. Your figures gave that, did they not, Gregg?"

"Yes. And the other ship—how fast is it?"

"Quite fast. In eight days—or nine, perhaps—it will reach the Moon."

She seemed willing enough to talk. There was indeed, no particular reason for reticence; I could not, she naturally felt, turn the knowledge to account.

"Manned—" I prompted.

"About forty men."

"And armed? Long range projectors?"

"You ask very avid questions, Gregg!"

"Why should I not? Don't you suppose I'm interested?"

I touched her. "Moa, did it ever occur to you, if once you and Miko trusted me—which you don't—I might show more interest in joining you?"

The look on her face emboldened me. "Did you ever think of that, Moa? And some arrangement for my share of this treasure? I am not like Johnson, to be hired for a hundred pounds of gold-leaf."

"Gregg, I will see that you get your share. Riches, for you—and me."

"I was thinking, Moa, when we land at the Moon tomorrow—where is our equipment?"

The Moon, with its lack of atmosphere, needed special equipment. I had never heard Carter mention what apparatus the *Planetara* was carrying.

Moa laughed. "We have located air-suits and helmets—a variety of suitable apparatus, Gregg. But we were not foolish enough to leave Great-New York on this voyage without our own arrangements. My brother, and Coniston and Prince—all of us shipped crates of

freight consigned to Ferrok-Shahn—and Rankin had special baggage marked 'theatrical apparatus.'"

I understood it now. These brigands had boarded the *Planetara* with their own Moon equipment, disguised as freight and personal baggage. Shipped in bond, to be inspected by the tax officials of Mars.

"It is on board now. We will open it when we leave the asteroid, Gregg. We are well equipped."

She bent toward me. And suddenly her long lean fingers were gripping my shoulders.

"Gregg, look at me!"

I gazed into her eyes. There was passion there; and her voice was suddenly intense.

"Gregg, I told you once a Martian girl goes after what she wants. It is you I want—"

Not for me to play like a cad upon a woman's emotions! "Moa, you flatter me."

"I love you." She held me off, gazing at me. "Gregg—"

I must have smiled. And abruptly she released me.

"So you think it amusing?"

"No. But on Earth—"

"We are not on the Earth. Nor am I of the Earth!" She was gauging me keenly. No note of pleading was in her voice; a stern authority; and the passion was swinging to anger.

"I am like my brother: I do not understand you, Gregg Haljan. Perhaps you think you are clever? It seems stupidity, the fatuousness of man!"

"Perhaps," I said.

There was a moment of silence. "Gregg, I said I loved you. Have you no answer?"

"No." In truth, I did not know what sort of answer it would be best to make. Whatever she must have read

in my eyes, it stirred her to fury. Her fingers with the strength of a man in them, dug into my shoulders. Her gaze searched me.

"You think you love someone else? Is that it?"

That was horribly startling; but she did not mean it just that way. She amended with caustic venom: "That little Anita Prince! You thought you loved her! Was that it?"

"No!"

But I hardly deceived her. "Sacred to her memory! Her ratlike little face—soft voice like a purring, sniveling cat! Is that what you're remembering, Gregg Haljan?" she sneered.

I tried to laugh. "What nonsense!"

"Is it? Then why are you cold under my touch? Am I—a girl descended from the Martian flame-workers—impotent now to awaken a man?"

A woman scorned! In all the Universe there could be no more dangerous an enemy. An incredible venom shot from her eyes.

"That miserable mouselike creature! Well for her that my brother killed her."

It struck me cold. If Anita was unmasked, beyond all the menace of Miko's wooing, I knew that the venom of Moa's jealousy was a greater danger.

I said sharply, "Don't be simple, Moa!" I shook off her grip. "You imagine too much. You forget that I am a man of the Earth and you a girl of Mars."

"Is that reason why we should not love?"

"No. But our instincts are different. Men of the Earth are born to the chase."

I was smiling. With thought of Anita's danger I could find it readily in my heart to dupe this Amazon.

"Give me time, Moa. You attract me."

"You lie!"

"Do you think so?" I gripped her arm with all the power of my fingers. It must have hurt her, but she gave no sign; her gaze clung to me steadily.

"I don't know what to think, Gregg Haljan...."

I held my grip. "Think what you like. Men of Earth have been known to kill the thing they love."

"You want me to fear you?"

"Perhaps."

She smiled scornfully. "That is absurd."

I released her. I said earnestly, "I want you to realize that if you treat me fairly, I can be of great advantage to this venture. There will be fighting—I am fearless."

Her venomous expression was softening. "I think that is true, Gregg."

"And you need my navigating skill. Even now I should

be in the turret."

I stood up. I half expected she would stop me, but she did not. I added, "Shall we go?"

She stood beside me. Her height brought her face level with mine.

"I think you will cause no more trouble, Gregg?"

"Of course not. I am not wholly witless."

"You have been."

"Well, that is over." I hesitated. Then I added, "A man of Earth does not yield to love when there is work to do. This treasure—"

I think that of everything I said, this last most convinced her.

She interrupted, "That I understand." Her eyes were smoldering. "When it is over—when we are rich—then I will claim you, Gregg."

She turned from me. "Are you ready?"

"Yes. No! I must get that sheet of Hahn's last figures."

"Are they checked?"

"Yes." I picked the sheet up from my desk. "Hahn is fairly accurate, Moa."

"A fool nevertheless. An apprehensive fool."

A comradeship seemed coming between us. It was my purpose to establish it.

"Are we going to maroon Dr. Frank with the passengers?" I asked.

"Yes."

"But he may be of use to us." I wanted Dr. Frank kept aboard. I still felt that there was a chance for us to recapture the ship.

But Moa shook her head decisively. "My brother has decided not. We will be well rid of Dr. Frank. Are you

ready, Gregg?"

"Yes."

She opened the door. Her gesture reassured the lookout, who was alertly watching the stern watch-tower.

"Come, Gregg."

I stepped out, and followed her forward along the deck, which now was bright with the radiance of the nearby asteroid.

Chapter 18 Marooned on an Asteroid

A fair little world. I had thought so before; and I thought so now as I gazed at the asteroid hanging so close before our bow. A huge, thin crescent, with the Sun off to one side behind it. A silver crescent, tinged with red. From this near viewpoint, all of the little globe's disc was visible. The shadowed portion lay dimly red, mysteriously; the sunlit crescent—widening visibly as we approached—was gleaming silver. Inky moonlike shadows in the hollows, brilliant light upon the mountain heights. The seas lay in gray patches. The convexity of the disc was sharply defined. So small a world! Fair and beautiful, shrouded with clouded areas.

"Where is Miko?"

"In the lounge, Gregg."

"Can we stop there?"

Moa turned into the lounge archway. Strange, tense scene. I saw Anita at once. Her robed figure lurked in

an inconspicuous corner; her eyes were upon me as Moa and I entered, but she did not move. The thirty-odd passengers were huddled in a group. Solemn, white-faced men, frightened women. Some of them were sobbing. One Earth-woman—a young widow—sat holding her little girl, and wailing with uncontrolled hysteria. The child knew me. As I appeared now, with my gold-laced white coat over my shoulders, the little child seemed to see in my uniform a mark of authority. She left her mother and ran to me.

"You, please—you will help us? My moms is crying."

I sent her gently back. But there came upon me then a compassion for these innocent passengers, fated to have embarked upon this ill-starred voyage. Herded here in this cabin, with brigands like pirates of old guarding them. Waiting now to be marooned on an uninhabited asteroid roaming in space. A sense of responsibility swept me. I swung upon Miko. He stood with a nonchalant grace, lounging against the wall with a cylinder dangling in his hand. He anticipated me.

"So, Haljan—she put some sense into your head? No more trouble? Then get into the turret. Moa, stay there with him. Send Hahn here. Where is that ass Coniston? We will be in the atmosphere shortly."

I said, "No more trouble from me, Miko. But these passengers—what preparation are you making for them on the asteroid?"

He stared in surprise. Then he laughed. "I am no murderer. The crew is preparing food, all we can spare. And tools. They can build themselves shelter—they will be picked up in a few weeks."

Dr. Frank was here. I caught his gaze, but he did not speak. On the lounge couches there still lay the quarter-score bodies. Rankin, who had been killed by Blackstone in the fight; a man passenger killed; a woman and a man wounded.

Miko added, "Dr. Frank will take his medical supplies—he will care for the wounded. There are other bodies among the crew." His gesture was deprecating. "I have not buried them. We will put

them ashore; easier that way."

The passengers were all eyeing me. I said:

"You have nothing to fear. I will guarantee you the best equipment we can spare. You will give them apparatus with which to signal?" I demanded of Miko.

"Yes. Get to the turret."

I turned away, with Moa after me. Again the little girl ran forward.

"Come—speak to my moms! She is crying."

It was across the cabin from Miko. Coniston had appeared from the deck; it created a slight diversion. He joined Miko.

"Wait," I said to Moa. "She is afraid of you. This is humanity."

I pushed Moa back. I followed the child. I had seen that Venza was sitting with the child's weeping

mother. This was a ruse to get word with me.

I stood before the terrified woman while the little girl clung to my legs.

I said gently, "Don't be so frightened. Dr. Frank will take care of you. There is no danger—you will be safer on the asteroid than here on the ship."

I leaned down and touched her shoulder. "There is no danger."

I was between Venza and the open cabin. Venza whispered swiftly, "When we are landing, Gregg, I want you to make a commotion—anything—just as the women passengers go ashore."

"Why? No, of course you will have food, Mrs. Francis."

"Never mind! An instant. Just confusion. Go, Gregg—don't speak now!"

I raised the child. "You take care of mother." I kissed

her.

From across the cabin Miko's sardonic voice made me turn. "Touching sentimentality, Haljan! Get to your post in the turret!"

His rasping note of annoyance brooked no delay. I set the child down. I said, "I will land us in an hour. Depend on it."

Hahn was at the controls when Moa and I reached the turret.

"You will land us safely, Haljan?" he demanded anxiously.

I pushed him away. "Miko wants you in the lounge."

"You take command here?"

"Of course, Hahn. I am no more anxious for a crash than you."

He sighed with relief. "That is true. I am no expert at

atmospheric entry, Haljan—nor Coniston, nor Miko."

"Have no fear. Sit down, Moa."

I waved to the look-out in the forward watch-tower, and got his routine gesture. I rang the corridor bells, and the normal signals came promptly back.

"It's correct, Hahn. Get away with you." I called after him. "Tell Miko that things are all right here."

Hahn's small dark figure, lithe as a leopard in his tight fitting trousers and jacket with his robe now discarded, went swiftly down the spider incline and across the deck.

"Moa, where is Snap? By the infernal, if he has been injured!—"

Up on the helio-room bridge the brigand guard still sat. Then I saw that Snap was out there sitting with him. I waved from the turret window, and Snap's cheery gesture answered me. His voice carried down through the silver moonlight: "Land us safely, Gregg.

These weird amateur navigators!"

Within the hour I had us dropping into the asteroid's atmosphere. The ship heated steadily. The pressure went up. It kept me busy with the instruments and the calculations. But my signals were always promptly answered from below. The brigand crew did its part efficiently.

At a hundred and fifty thousand feet I shifted the gravity plates to the landing combinations, and started the electronic engines.

"All safe, Gregg?" Moa sat at my elbow; her eyes, with what seemed a glow of admiration in them, followed my busy routine activities.

"Yes. The crew works well."

The electronic streams flowed out like a rocket tail behind us. The *Planetara* caught their impetus. In the rarified air, our bow lifted slightly, like a ship riding a gentle ground swell. At a hundred thousand feet we sailed gently forward, hull down to the asteroid's

surface, cruising to seek a landing space.

A little sea was now beneath us. A shadowed sea, deep purple in the night down there. Occasional green-verdured islands showed, with the lines of white surf marking them. Beyond the sea, a curving coastline was visible. Rocky headlines, behind which mountain foothills rose in serrated, verdured ranks. The sunlight edged the distant mountains; and presently this rapidly turning little world brought the sunlight forward.

It was day beneath us. We slid gently downward. Thirty thousand feet now, above a sparkling blue ocean. The coastline was just ahead: green with a lush, tropical vegetation. Giant trees, huge-leaved. Long dangling vines; air plants, with giant pods and vivid orchidlike blossoms.

I sat at the turret window, staring through my glasses. A fair little world, yet obviously uninhabited. I could fancy that all this was newly-sprung vegetation. This asteroid had whirled in from the cold of the interplanetary space far outside our Solar System. A

few years ago—as time might be measured astronomically, it was no more than yesterday—this fair landscape was congealed white and bleak, with a sweep of glacial ice. But the seeds of life miraculously were here. The miracle of life! Under the warming, germinating sunlight, the verdure sprung.

"Can you find landing space, Gregg?"

Moa's question brought back my wandering fancies. I saw an upland glade, a level spread of ferns with the forest banked around it. A cliff-height nearby, frowning down at the sea.

"Yes. I can land us there." I showed her through the glasses. I rang the sirens, and we spiraled, descending further. The mountain tops were now close beneath us. Clouds were overhead, white masses with blue sky behind them. A day of brilliant sunlight. But soon, with our forward cruising, it was night. The sunlight dropped beneath the sharply convex horizon; the sea and the land went purple.

A night of brilliant stars; the Earth was a blazing blue-

red point of light. The heavens visibly were revolving; in an hour or so it would be daylight again.

On the forward deck now Coniston had appeared, commanding half a dozen of the crew. They were carrying up caskets of food and the equipment which was to be given the marooned passengers. And making ready the disembarking incline, loosening the seals of the side-dome windows.

Sternward on the deck, by the lounge oval, I could see Miko standing. And occasionally the roar of his voice at the passengers sounded.

My vagrant thought flung back into Earth's history. Like this, ancient travelers of the surface of the sea were herded by pirates to walk the plank, or put ashore, marooned upon some fair desert island of the tropic Spanish main.

Hahn came mounting our turret incline. "All is well, Gregg Haljan?"

"Get to your work," Moa told him sharply. "We land in

an hour-quadrant."

He retreated, joining the bustle and confusion which now was beginning on the deck. It struck me—could I turn that confusion to account? Would it be possible, now at the last moment, to attack these brigands? Snap still sat outside the helio-room doorway. But his guard was alert, with upraised projector. And that guard, I saw, in his position high amidships, commanded all the deck.

And I saw too, as the passengers now were herded in a line from the lounge oval, that Miko had roped and bound all of the men. And a clanking chain connected them. They came like a line of convicts, marching forward, and stopped on the open deck-space near the base of the turret. Dr. Frank's grim face gazed up at me.

Miko ordered the women and children in a group beside the chained men. His words to them reached me: "You are in no danger. When we land, be careful. You will find gravity very different—this is a very small world."

I flung on the landing lights; the deck glowed with the blue radiance; the search-beams shot down beside our hull. We hung now a thousand feet above the forest glade. I cut off the electronic streams. We poised, with the gravity-plates set at normal, and only a gentle night-breeze to give us a slight side drift. This I could control with the lateral propeller rudders.

For all my busy landing routine, my mind was on other things. Venza's swift words back there in the lounge. I was to create a commotion while the passengers were landing. Why? Had she and Dr. Frank, perhaps, some last minute desperate purposes?

I determined I would do what she said. Shout, or mis-order the lights. That would be easy. But to what advantage?

I was glad it was night—I had, indeed, calculated our descent so that the landing would be in darkness. But to what purpose? These brigands were very alert. There was nothing I could think of to do which would avail us anything more than a possible swift death

under Miko's anger.

"Well done, Gregg!" said Moa.

I cut off the last of the propellers. With scarcely a perceptible jar, the *Planetara* grounded, rose like a feather and settled to rest in the glade. The deep purple night with stars overhead was around us. I hissed out our interior air through the dome and hull-ports, and admitted the night-air of the asteroid. My calculations—of necessity mere mathematical approximations—proved fairly accurate. In temperature and pressure there was no radical change as the dome-windows slid back.

We had landed. Whatever Venza's purpose, her moment was at hand. I was tense. But I was aware also, that beside me Moa was very alert. I had thought her unarmed. She was not. She sat back from me; in her hand was a small thin knife-blade.

She murmured tensely, "You have done your part, Gregg. Well and skillfully done. Now we will sit here quietly and watch them land."

Snap's guard was standing, keenly watching. The look-outs in the forward and stern towers were also armed; I could see them both gazing keenly down at the confusion of the blue-lit deck.

The incline went over the hull-side and touched the ground.

"Enough!" Miko roared. "The men first. Hahn, move the women back! Coniston, pile those caskets to the side. Get out of the way, Prince."

Anita was down there. I saw her at the edge of the group of women. Venza was near her.

Miko shoved her. "Get out of the way, Prince. You can help Coniston. Have the things ready to throw off."

Five of the steward-crew were at the head of the incline. Miko shouted up at me:

"Haljan, hold our shipboard gravity normal."

"Yes," I responded.

I had done so. Our magnitizers had been adjusted to the shifting calculations of our landing. They were holding now at intensities, so that upon the *Planetara* no change from fairly normal Earth-gravity was apparent. I rang a tentative inquiry signal; the operator in the hull-magnetizer control answered that he was at his post.

The line of men were first to descend. Dr. Frank led them. He flashed a look of farewell up at me and Snap as he went down the incline with the chained men passengers after him.

Motley procession! Twenty odd, dishevelled, half-clothed men of three worlds. The changing, lightening gravity on the incline caught them. Dr. Frank bounded up to the rail under the impetus of his step: caught and held himself, drew himself back. The line swayed. In the dim, blue-lit glare it seemed unreal, crazy. A grotesque dream of men descending a plank.

They reached the forest glade. Stood swaying, afraid at first to move. The purple night crowded them; they stood gazing at this strange world, their new prison.

"Now the women."

Miko was shoving the women to the head of the incline. I could feel Moa's steady gaze upon me. Her knife-blade gleamed in the turret light.

She murmured again, "In a few minutes you can ring us away, Gregg."

I felt like an actor awaiting his cue in the wings of some turgid drama the plot of which he did not know. Venza was near the head of the incline. Some of the women and children were on it. A woman screamed. Her child had slipped from her hand, bounded up over the rail, and fallen. Hardly fallen—floated down to the ground, with flailing arms and legs, landing in the dark ferns, unharmed. Its terrified wail came up.

There was a confusion on the incline. Venza, still on the deck, seemed to send a look of appeal to the turret. My cue?

I slid my hand to the light switchboard. It was near my knees. I pulled a switch. The blue-lit deck beneath

the turret went dark.

I recall an instant of horrible, tense silence, and in the gloom beside me I was aware of Moa moving. I felt a thrill of instinctive fear—would she plunge that knife into me?

The silence of the darkened deck was broken with a confusion of sounds. A babble of voices; a woman passenger's scream; shuffling of feet; and above it all, Miko's roar:

"Stand quiet! Everyone! No movement!"

On the descending incline there was chaos. The disembarking women were clinging to the gang-rail; some of them had evidently surged over it and fallen. Down on the ground in the purple-shadowed starlight I could vaguely see the chained line of men. They too were in confusion, trying to shove themselves toward the fallen women.

Miko roared:

"Light those tubes! Gregg Haljan! By the Almighty, Moa, are you up there? What is wrong? The light-tubes—"

Dark drama of unknown plot! I wonder if I should try and leave the turret. Where was Anita? She had been down there on the deck when I flung out the lights.

I think twenty seconds would have covered it all. I had not moved. I thought, "Is Snap concerned with this?"

Moa's knife could have stabbed me. I felt her lunge against me; and suddenly I was gripping her, twisting her wrist. But she flung the knife away. Her strength was almost the equal of my own. Her hand went for my throat, and with the other hand she was fumbling.

The deck abruptly sprang into light again. Moa had found the switch and threw it back.

"Gregg!"

She fought me as I tried to reach the switch. I saw

down on the deck Miko gazing up at us. Moa panted, "Gregg—stop! If he—sees you doing this, he'll kill you —"

The scene down there was almost unchanged. I had answered my cue. To what purpose? I saw Anita near Miko. The last of the women were on the plank.

I had stopped struggling with Moa. She sat back, panting; and then she called: "Sorry, Miko. It will not happen again."

Miko was in a towering rage. But he was too busy to bother with me; his anger swung on those nearest him. He shoved the last of the women violently at the incline. She bounded over. Her body, with the gravity-pull of only a few Earth-pounds, sailed in an arc and dropped to the sward near the swaying line of men.

Miko swung back. "Get out of my way!" A sweep of his huge arm knocked Anita sidewise. "Prince, damn you, help me with those boxes!"

The frightened stewards were lifting the boxes,

square metal storage-chests each as long as a man, packed with food, tools, and equipment.

"Here, get out of my way, all of you!"

My breath came again; Anita nimbly retreated before Miko's angry rush. He dashed at the stewards. Three of them held a box. He took it from them; raised it at the top of the incline. Poised it over his head an instant, with his massive arms like gray pillars beneath it. And flung it. The box catapulted, dropped; and then, passing the Planetara's gravity area, it sailed in a long flat arc over the forest glade and crashed into the purple underbrush.

"Give me another!"

The stewards pushed another at him. Like an angry Titan, he flung it. And another. One by one the chests sailed out and crashed.

"There is your food—go pick it up! Haljan, make ready to ring us away!"

On the deck lay the dead body of Rance Rankin, which the stewards had carried out. Miko seized it, flung it.

"There! Go to your last resting place!"

And the other bodies. Balch Blackstone, Captain Carter, Johnson—Miko flung them. And the course masters and those of our crew who had been killed; the stewards appeared with them; Miko unceremoniously cast them off.

The passengers were all on the ground now. It was dim down there. I tried to distinguish Venza, but could not. I could see Dr. Frank's figure at the end of the chained line of men. The passengers were gazing in horror at the bodies hurtling over them.

"Ready, Haljan?"

Moa prompted me. "Tell him yes!"

I called, "Yes!" Had Venza failed in her unknown purpose? It seemed so. On the helio-room bridge

Snap and his guard stood like silent statues in the blue-lit gloom.

The disembarkation was over.

"Close the ports," Miko commanded.

The incline came folding up with a clatter. The port and dome-windows slid closed. Moa hissed against my ear:

"If you want life, Gregg Haljan, you will start your duties!"

Venza had failed. Whatever it was, it had come to nothing. Down in the purple forest, disconnected now from the ship, the last of our friends stood marooned. I could distinguish them through the blur of the closed dome—only a swaying, huddled group was visible. But my fancy pictured this last sight of them—Dr. Frank, Venza, Shac and Dud Ardley.

They were gone. There were left only Snap, Anita, and myself.

I was mechanically ringing us away. I heard my sirens sounding down below, with the answering clangs here in the turret. The *Planetara's* respiratory controls started; the pressure equalizers began operating, and the gravity plates shifted into lifting combinations.

The ship was hissing and quivering with it, combined with the grating of the last of the dome ports. And Miko's command:

"Lift, Haljan."

Hahn had been mingled with the confusion of the deck, though I had hardly noticed him; Coniston had remained below, with the crew answering my signals. Hahn stood now with Miko, gazing down through a deck window. Anita was alone at another.

"Lift, Haljan."

I lifted us gently, bow first, with a repulsion of the bow plates. And started the central electronic engine. Its thrust from our stern moved us diagonally over the purple forest trees.

The glade slid downward and away. I caught a last vague glimpse of the huddled group of marooned passengers, staring up at us. Left to their fate, alone on this deserted little world.

With the three engines going we slid smoothly upward. The forest dropped, a purple spread of tree-tops, edged with starlight and Earth-light. The sharply curving horizon seemed following us up. I swung on all the power. We mounted at a forty degree angle, slowly circling, with a bank of clouds over us to the side and the shining little sea beneath.

"Very good, Gregg." In the turret light Moa's eyes blazed at me. "I do not know what you meant by darkening the deck-lights." Her fingers dug at my shoulders. "I will tell my brother it was an error."

I said, "An error—yes."

"An error? I don't know what it was. But you have me to deal with now. You understand? I will tell my brother so. You said, 'On Earth a man may kill the thing he loves.' A woman of Mars may do that!

Beware of me, Gregg Haljan."

Her passion-filled eyes bored into me. Love? Hate?
The venom of a woman scorned—a mingling of turgid
emotions....

I twisted away from her grip and ignored her; she sat
back, silently watching my busy activities; the
calculations of the shifting conditions of gravity,
pressures, temperatures; a checking of the score or
more of instruments on the board before me.

Mechanical routine. My mind went to Venza, back
there on the asteroid. The wandering little world was
already shrinking to a convex surface beneath us.
Venza, with her last unknown play, gone to failure.
Had I failed my cue? Whatever my part, it seemed
now that I must have horribly mis-acted it.

The crescent Earth was presently swinging over our
bow. We rocketed out of the asteroid's shadow. The
glowing, flaming Sun appeared, making a crescent of
the Earth. With the glass I could see our tiny Moon,
visually seeming to hug the limb of its parent Earth.

We were away upon our course for the Moon. My mind flung ahead. Grantline with his treasure, unsuspecting this brigand ship. And suddenly, beyond all thought of Grantline and his treasure, there came to me a fear for Anita. In God's truth I had been, so far, a very stumbling inept champion—doomed to failure with everything I tried. It swept me, so that I cursed my own incapacity. Why had I not contrived to have Anita desert at the asteroid? Would it not have been far better for her there? Taking her chance for rescue with Dr. Frank, Venza and the others?

But no! I had, like an inept fool, never thought of that! Had left her here on board at the mercy of these outlaws.

And I swore now that, beyond everything, I would protect her.

Futile oath! If I could have seen ahead a few hours! But I sensed the catastrophe. There was a shudder within me as I sat in that turret, docilely guiding us out through the asteroid's atmosphere, heading us upon our course for the Moon.

Chapter 19 In the Zed-light Glow

"Try again. By the infernal, Snap Dean, if you do anything to balk us!"

Miko scanned the apparatus with keen eyes. How much technical knowledge of signaling instruments did this brigand leader have? I was tense and cold with apprehension as I sat in a corner of the helio-room, watching Snap. Could Miko be fooled? Snap, I knew, was trying to fool him.

The Moon spread close beneath us. My log-chart, computed up to thirty minutes past, showed us barely some thirty thousand miles over the Moon's surface. The globe lay in quadrature beneath our bow quarter—a huge quadrant spreading across the black starry vault of the lower heavens. A silver quadrant. The sunset caught the Lunar mountains, flung slanting shadows over the empty Lunar plains. All the disc was plainly visible. The mellow Earth-light glowed serene and pale to illumine the Lunar night.

The *Planetara* was bathed in silver. A brilliant silver

glare swept the forward deck, clean white and splashed with black shadows. We had partly circled the Moon, so as now to approach it from the Earthward side. I had worked with extreme concentration through the last few hours, plotting the trajectory of our curving sweep, setting the gravity plates with constantly shifting combinations. And with it a necessity for the steady retarding of our velocity.

Miko for a time was at my elbow in the turret. I had not seen Coniston and Hahn of recent hours. I had slept, awakened refreshed, and had a meal. Coniston and Hahn remained below, one or the other of them always with the crew to execute my sirened orders. Then Coniston came to take my place in the turret, and I went with Miko to the helio-room.

"You are skilful, Haljan." A measure of grim approval was in Miko's voice. "You evidently have no wish to try and fool me in this navigation."

I had not, indeed. It is delicate work at best, coping with the intricacies of celestial mechanics upon a semicircular trajectory with retarding velocity, and

with a make-shift crew we could easily have come upon real difficulty.

We hung at last, hull-down, facing the Earthward hemisphere of the Lunar disc. The giant ball of the Earth lay behind and above us—the Sun over our stern quarter. With forward velocity almost checked, we poised, and Snap began his signals to the unsuspecting Grantline.

My work momentarily was over. I sat watching the helio-room. Moa was here, close beside me; I felt always her watchful gaze, so that even the play of my expression needed reining.

Miko worked with Snap. Anita too was here. To Miko and Moa it was the somber, taciturn George Prince, shrouded always in his black mourning cloak, disinclined to talk; sitting alone, brooding and cowardly sullen.

Miko repeated, "By the infernal, if you try to fool me, Snap Dean!"

The small metal room, with its grid floor and low-arched ceiling, glared with moonlight through its windows. The moving figures of Snap and Miko were aped by the grotesque, misshapen shadows of them on the walls. Miko gigantic—a great, menacing ogre. Snap small and alert—a trim, pale figure in his tight-fitting white trousers, broad-flowing belt, and white shirt open at the throat. His face was pale and drawn from lack of sleep and the torture to which Miko had subjected him. But he grinned at the brigand's words, and pushed his straggling hair closer under the red eyeshade.

"I'm doing my best, Miko—you can believe it."

The room over long periods was deadly silent, with Miko and Snap bending watchfully at the crowded banks of instruments. A silence in which my own pounding heart seemed to echo. I did not dare look at Anita, nor she at me. Snap was trying to signal Earth, not the Moon! His main helios were set in the reverse. The infra-red waves, flung from the bow window, were of a frequency which Snap and I believed that Grantline could not pick up. And over against the

wall, close beside me and seemingly ignored by Snap, there was a tiny ultra-violet sender. Its faint hum and the quivering of its mirrors had so far passed unnoticed.

Would some Earth-station pick it up? I prayed so. There was a thumb nail mirror here which could bring an answer. I prayed that it might swing.

Would some Earth telescope be able to see us? I doubted it. The pinpoint of the *Planetara's* infinitesimal bulk would be beyond them.

Long silences, broken only by the faint hiss and murmur of Snap's instruments.

"Shall I try the 'graphs, Miko?"

"Yes."

I helped him with the spectroheliograph. At every level the plates showed us nothing save the scarred and pitted Moon-surface. We worked for an hour. There was nothing. Bleak cold night on the Moon here

beneath us. A touch of fading sunlight upon the Apennines. Up near the South Pole, Tycho with its radiating open rills stood like a grim dark maw.

Miko bent over a plate. "Something here? Is there?"

An abnormality upon the frowning ragged cliffs of Tycho? We thought so. But then it seemed not.

Another hour. No signal came from Earth. If Snap's calls were getting through we had no evidence of it. Abruptly Miko strode at me from across the room. I went cold and tense; Moa shifted, alert to my every movement. But Miko was not interested in me. A sweep of his clenched fist knocked the ultra-violet sender and its coils and mirrors in a tinkling crash to the grid at my feet.

"We don't need that, whatever it is!"

He rubbed his knuckles where the violet waves had tinged them, and turned grimly back to Snap.

"Where are your Gamma ray mirrors? If the treasure

is exposed—"

This Martian's knowledge was far greater than we believed. He grinned sardonically at Anita. "If our treasure is on this hemisphere, Prince, we should pick up Gamma rays? Don't you think so? Or is Grantline so cautious it will all be protected?"

Anita spoke in a careful, throaty drawl. "The Gamma rays came plain enough when we passed here on the way out."

"You should know," grinned Miko. "An expert eavesdropper, Prince—I will say that for you. Come Dean, try something else. By God, if Grantline does not signal us, I will be likely to blame you—my patience is shortening. Shall we go closer, Haljan?"

"I don't think it would help," I said.

He nodded. "Perhaps not. Are we checked?"

"Yes." We were poised, very nearly motionless. "If you wish an advance, I can ring it. But we need a surface

destination now."

"True, Haljan." He stood thinking. "Would a zed-ray penetrate those crater-cliffs? Tycho, for instance, at this angle?"*

*[An allusion to the use of the zed-ray light for making spectro-photographs of what might be behind obscuring rock masses, similar to the old-style X-ray.]

"It might," Snap agreed. "You think he may be on the Northern inner side of Tycho?"

"He may be anywhere," said Miko shortly.

"If you think that," Snap persisted, "suppose we swing the *Planetara* over the South Pole. Tycho, viewed from there—"

"And take another quarter-day of time?" Miko sneered. "Flash on your zed-ray; help him hook it up, Haljan."

I moved to the lens-box of the spectroheliograph. It

seemed that Snap was very strangely reluctant: Was it because he knew that the Grantline camp lay concealed on the north inner wall of Tycho's giant ring? I thought so. But Snap flashed a queer look at Anita. She did not see it, but I did. And I could not understand it.

My accursed, witless incapacity! If only I had taken warning!

"Here," commanded Miko. "A score of 'graphs with the zed-ray. I tell you I will comb this surface if we have to stay here until our ship comes from Ferrok-Shahn to join us!"

The Martian brigands were coming. Miko's signals had been answered. In ten days the other brigand ship, adequately manned and armed, would be here.

Snap helped me connect the zed-ray. He did not dare even to whisper to me, with Moa hovering always so close. And for all Miko's sardonic smiling, we knew that he would tolerate nothing from us now. He was fully armed, and so was Moa.

I recall that Snap several times tried to touch me significantly. Oh, if only I had taken warning!

We finished our connecting. The dull gray point of zed-ray gleamed through the prisms, to mingle with the moonlight entering the main lens. I stood with the shutter trip.

"The same interval, Snap?"

"Yes."

Beside me, I was aware of a faint reflection of the zed-light—a gray Cathedral shaft crossing the helio-room and falling upon the opposite wall. An unreality there, as the zed-light faintly strove to penetrate the metal room-side.

I said, "Shall I make the exposure?"

Snap nodded. But that 'graph was never made. An exclamation from Moa made us all turn. The Gamma mirrors were quivering! Grantline had picked our signals! With what undoubtedly was an intensified

receiving equipment which Snap had not thought Grantline able to use, he had caught our faint zed-rays, which Snap was sending only to deceive Miko. And Grantline had recognized the *Planetara*, and had released his occulting screens surrounding the radium ore. The Gamma rays were here, unmistakable!

And upon their heels came Grantline's message. Not in the secret system he had arranged with Snap, but unsuspectingly in open code. I could read the swinging mirror, and so could Miko.

And Miko decoded it triumphantly aloud:

"Surprised but pleased your return. Approach Mid-Northern hemisphere, region of Archimedes, forty thousand toises off nearest Apennine range."*

*[About fifty miles.]

The message broke off. But even its importance was overshadowed. Miko stood in the center of the helio-room, triumphantly reading the light-indicator. Its

beam swung on the scale, which chanced to be almost directly over Anita's head. I saw Miko's expression change. A look of surprise, amazement came to him.

"Why—"

He gasped. He stood staring. Almost stupidly staring for an instant. And as I regarded him with fascinated horror, there came upon his heavy gray face a look of dawning comprehension. And I heard Snap's startled intake of breath. He moved to the spectroheliograph, where the zed-ray connections were still humming.

But with a leap Miko flung him away. "Off with you! Moa, watch him! Haljan, don't move!"

Again Miko stood staring. Oh dear God, I saw now that he was staring at Anita!

"Why George Prince! How strange you look!"

Anita did not move. She was stricken with horror: she shrank back against the wall, huddled in her cloak. Miko's sardonic voice came again:

"How strange you look. Prince!" He took a step forward. He was grim and calm. Horribly calm. Deliberate. Gloating—like a great gray monster in human form toying with a fascinated, imprisoned bird.

"Move just a little Prince. Let the zed-ray light fall more fully."

Anita's head was bare. That pale, Hamletlike face. Dear God, the zed-light reflection lay gray and penetrating upon it!

Miko took another step. Peering. Grinning. "How amazing, George Prince! Why, I can hardly believe it!"

Moa was armed with an electronic cylinder. For all her amazement—what turgid emotions sweeping her I can only guess—she never took her eyes from Snap and me.

"Back! Don't move, either of you!" She hissed it at us.

Then Miko leaped at Anita like giant gray leopard

pouncing.

"Away with that cloak, Prince!"

I stood cold and numbed. And realization came at last. The faint zed-light glow had fallen by chance upon Anita's face. Penetrated the flesh; exposed, faintly glowing, the bone-line of her jaw. Unmasked the waxen art of Glutz.

And Miko had seen it.

"Why George, how surprising! Away with that cloak!"

He seized her wrist, drew her forward, beyond the shaft of zed-light, into the brilliant light of the Moon. And ripped her cloak from her. The gentle curves of her woman's figure were so unmistakable!

And as Miko gazed at them, all his calm triumph swept away.

"Why, Anita!"

I heard Moa mutter: "So that is it?" A venomous flashing look—a shaft from me to Anita and back again. "So that is it?"

"Why, *Anita!*"

Miko's great arms gathered her up as though she were a child. "So I have you back; from the dead delivered back to me!"

"Gregg!" Snap's warning, and his grip over my shoulders brought me a measure of sanity. I had tensed to spring. I stood quivering, and Moa thrust her weapon against my face. The helio mirrors were swaying again with another message from Grantline. But it came ignored by us all.

In the glare of moonlight by the forward window, Miko held Anita, his great hands pawing her with triumphant possessive caresses.

"So, little Anita, you are given back to me."

Against her futile struggles he held her.

Dear God, if only I had had the wit to have prevented this!

Chapter 20 The Grantline Camp

In the mid-northern hemisphere upon the Earthward side of the Moon, the giant crater of Archimedes stood brooding in silent majesty. Grim, lofty walls, broken, pitted and scarred, rising precipitous to the upper circular rim. Night had just fallen. The sunlight clung to the crater-heights; it tinged with flame the jagged peaks of the Apennine Mountains which rose in tiers at the horizon; and it flung great inky shadows over the intervening lowlands.

Northward, the Mare Imbrium stretched mysterious and purple, its million rills and ridges and crater holes flattened by distance and the gathering darkness into a seeming level surface. The night slowly deepened. The dead-black vault of the sky blazed with its brilliant starry gems. The gibbous Earth hung high above the horizon, motionless, save for the invisible pendulum sway over the tiny arc, of its libration: widening to quadrature, casting upon the

bleak naked Lunar landscape its mellow Earth-glow.

Slow, measured process, this coming of the Lunar night! For an Earth-day the sunset slowly faded on the Apennines; the poised Earth widened a little further—an Earth-day of time, with the Earth-disc visibly rotating, the faint tracery of its oceans and continents passing in slow, majestic review.

Another Earth-day interval. Then another. And another. Full night now enveloped Archimedes. Splotches of Earth-light and starlight sheen slowly shifted as the night advanced.

Between the great crater and the nearby mountains, the broken, pseudo-level lowlands lay wan in the Earth-light. A few hundred miles, as distance would be measured upon Earth. A million million rills were here. Valleys and ridges, ravines, sharp-walled canyons, cliffs and crags—tiny craters like pockmarks.

Naked, gray porous rock everywhere. This denuded landscape! Cracked and scarred and tumbled, as

though some inexorable Titan torch had seared and crumbled and broken it, left it now congealed like a wind-lashed sea abruptly frozen into immobility.

Moonlight upon Earth so gently shines to make romantic a lover's smile! But the reality of the Lunar night is cold beyond human rationality. Cold and darkly silent. Grim desolation. Awesome. Majestic. A frowning majesty that even to the most intrepid human beholder is inconceivably forbidding.

And there were humans here now. On this tumbled plain, between Archimedes and the mountains, one small crater amid the million of its fellows was distinguished this night by the presence of humans. The Grantline camp! It huddled in the deepest purple shadows on the side of a bowl-like pit, a crudely circular orifice with a scant two miles across its rippling rim. There was faint light here to mark the presence of the living intruders. The blue-glow radiance of Morrell tube-lights under a spread of glassite.

The Grantline camp stood mid-way up one of the

inner cliff-walls of the little crater. The broken, rock-strewn floor, two miles wide, lay five hundred feet below the camp. Behind it, the jagged precipitous cliff rose another five hundred to the heights of the upper rim. A broad level shelf hung midway up the cliff, and upon it Grantline had built his little group of glassite dome shelters. Viewed from above there was the darkly purple crater floor, the upflung circular rim where the Earth-light tinged the spires and crags with yellow sheen; and on the shelf, like a huddled group of birds nests, Grantline's domes clung and gazed down upon the inner valley.

Intricate task, the building of these glassite shelters! There were three. The main one stood close at the brink of the ledge. A quadrangle of glassite walls, a hundred feet in length by half as wide, and a scant ten feet high to its flat-arched dome roof. Built for this purpose in Great-New York, Grantline had brought his aluminite girders and braces and the glassite panels in sections.

The air here on the Moon surface was negligible—a scant one five-thousandth of the atmospheric

pressure at the sea-level on Earth. But within the glassite shelter, a normal Earth-pressure must be maintained. Rigidly braced double walls to withstand the explosive tendency, with no external pressure to counteract it. A tremendous necessity for mechanical equipment had burdened Grantline's small ship to its capacity. The chemistry of manufactured air, the pressure equalizers, renewers, respirators, the lighting and temperature-maintenance systems—all the mechanics of a space-flyer were here.

And within the glassite double walls, there was necessity for a constant circulation of the Erentz temperature insulating system.*

*[An intricate system of insulation against extremes of temperature, developed by the Erentz Kinetic Energy Corporation in the twenty-first century. Within the hollow double shell of a shelter-wall, or an explorer's helmet-suit, or a space-flyer's hull, an oscillating semi-vacuum current was maintained--an extremely rarified air, magnetically charged, and maintained in rapid oscillating motion. Across this field the outer cold, or heat, as the case might be, could penetrate

only with slow radiation. This Erentz system gave the most perfect temperature insulation known in its day. Without it, interplanetary flight would have been impossible.

And it served a double purpose. Developed at first for temperature insulation only, the Erentz system surprisingly brought to light one of the most important discoveries made in the realm of physics of the century. It was found that any flashing, oscillating current, whether electronic, or the semi-vacuum of rarified air--or even a thin sheet of whirling fluid--gave also a pressure-insulation. The kinetic energy of the rapid movement was found to absorb within itself the latent energy of the unequal pressure.

(The intricate postulates and mathematical formulae necessary to demonstrate the operation of the physical laws involved would be out of place here.)

The *Planetara* was so equipped, against the explosive tendency of its inner air-pressures when flying in the near-vacuum of space. In the case of Grantline's glassite shelters, the latent energy of his room

interior air pressure went largely into a kinetic energy which in practical effect resulted only in the slight acceleration of the vacuum current, and thus never reached the outer wall. The Erentz engineers claimed for their system a pressure absorption of 97.4%, leaving, in Grantline's case, only 2.6% of room pressure to be held by the building's aluminite bracers.

It may be interesting to note in this connection that without the Erentz system as a basis, the great sub-sea developments on Earth and Mars of the twenty-first century would also have been impossible. Equipped with a fluid circulation device of the Erentz principle within its double hull, the first submarine was able to penetrate the great ocean deeps, withstanding the tremendous ocean pressures at depths of four thousand fathoms.]

There was this main Grantline building, stretching low and rectangular along the front edge of the ledge. Within it were living rooms, messroom and kitchen. Fifty feet behind it, connected by a narrow passage of glassite, was a similar, though smaller structure. The

mechanical control rooms, with their humming, vibrating mechanisms were here. And an instrument room with signaling apparatus, senders, receivers, mirror-grids and audiphones of several varieties; and an electro-telescope, small but modern, with dome overhead like a little Earth observatory.

From this instrument building, beside the connecting pedestrian passage, wire cables for light, and air-tubes and strings and bundles of instrument wires ran to the main structure—gray snakes upon the porous, gray Lunar rock.

The third building seemed a lean-to banked against the cliff-wall, a slanting shed-wall of glassite fifty feet high and two hundred in length. Under it, for months Grantline's borers had dug into the cliff. Braced tunnels were here, penetrating back and downward into this vein of radio-active rock.

The work was over now. The borers had been dismantled and packed away. At one end of the cliff the mining equipment lay piled in a litter. There was a heap of discarded ore where Grantline had carted and

dumped it after his first crude refining process had yielded it as waste. The ore-slag lay like gray powder-flakes strewn down the cliff. Tracks and ore-carts along the ledge stood discarded, mute evidence of the weeks and months of work these helmeted miners had undergone, struggling upon this airless, frowning world.

But now all that was finished. The radio-active ore was sufficiently concentrated. It lay—this treasure—in a seventy-foot pile behind the glassite lean-to, with a cage of wires over it and an insulation barrage guarding its Gamma rays from escaping to mark its presence.

The ore-shelter was dark; the other two buildings were lighted. And there were small lights mounted at intervals about the camp and along the edge of the ledge. A spider ladder, with tiny platforms some twenty feet one above the other, hung precariously to the cliff-face. It descended the five hundred feet to the crater floor; and, behind the camp, it mounted the jagged cliff-face to the upper rim-height, where a small observatory platform was placed.

Such was the outer aspect of the Grantline Treasure Camp near the beginning of this Lunar night, when, unbeknown to Grantline and his score of men, the *Planetara* with its brigands was approaching. The night was perhaps a sixth advanced. Full night. No breath of cloud to mar the brilliant starry heavens. The quadrant Earth hung poised like a giant mellow moon over Grantline's crater. A bright Earth, yet no air was here on this Lunar surface to spread its light. Only a glow, mingling with the spots of blue tube-light on the poles along the cliff, and the radiance from the lighted buildings.

The crater floor was dimly purple. Beyond the opposite upper rim, from the camp-height, the towering top of distant Archimedes was visible.

No evidence of movement showed about the silent camp. Then a pressure door in an end of the main building opened its tiny series of locks. A bent figure came out. The lock closed. The figure straightened and gazed about the camp. Grotesque, bloated semblance of a man! Helmeted, with rounded dome-hood suggestion of an ancient sea diver, yet goggled

and trunked like a gas-masked fighter of the twentieth century war.

He stooped presently and disconnected metal weights which were upon his shoes.*

*[Within the Grantline buildings it was found more convenient to use a gravity normal to Earth. This was maintained by the wearing of metal-weighted shoes and metal-loaded belt. The Moon-gravity is normally approximately one-sixth the gravity of Earth.]

Then he stood erect again, and with giant strides bounded along the cliff. Fantastic figure in the blue-lit gloom! A child's dream of crags and rocks and strange lights with a single monstrous figure in seven-league boots.

He went the length of the ledge with his twenty-foot strides, inspected the lights, and made adjustments. Came back, and climbed with agile, bounding leaps up the spider ladder to the dome on the crater top. A light flashed on up there. Then it was extinguished.

The goggled, bloated figure came leaping down after a moment. Grantline's exterior watchman making his rounds. He came back to the main building. Fastened the weights on his shoes. Signaled within.

The lock opened. The figure went inside.

It was early evening, after the dinner hour and before the time of sleep, according to the camp routine Grantline was maintaining. Nine P. M. of Earth Eastern-American time, recorded now upon his Earth chronometer. In the living room of the main building Johnny Grantline sat with a dozen of his men dispersed about the room, whiling away as best they could the lonesome hours.

"All as usual. This cursed Moon! When I get home—if ever I do get home—"

"Say your say, Wilks. But you'll spend your share of the gold-leaf and thank your constellations that you had your chance!"

"Let him alone! Come on, Wilks, take a hand here.

This game is no good with three."

The man who had been outside flung his hissing helmet recklessly to the floor and unsealed his suit.

"Here, get me out of this. No, I won't play. I can't play your cursed game with nothing at stake!"

"Commissioner's orders."

A laugh went up at the sharp look Johnny Grantline flung from where he sat reading in a corner of the room.

"Commander's orders. No gambling gold-leafers tolerated here."

"Play the game, Wilks." Grantline said quietly. "We all know it's infernal doing nothing."

"He's been struck by Earth-light," another man laughed. "Commander, I told you not to let that guy Wilks out at night."

A rough but good-natured lot of men. Jolly and

raucous by nature in their leisure hours. But there was too much leisure here now. Their mirth had a hollow sound. In older times, explorers of the frozen polar zones had to cope with inactivity, loneliness and despair. But at least they were on their native world. The grimness of the Moon was eating into the courage of Grantline's men. An unreality here. A weirdness. These fantastic crags. The deadly silence. The nights, almost two weeks of Earth-time in length, congealed by the deadly frigidity of Space. The days of black sky, blaring stars and flaming Sun, with no atmosphere to diffuse the daylight. Days of weird blending sheen of illumination with most of the Sun's heat radiating so swiftly from the naked Lunar surface that the outer temperature still was cold. And day and night, always the familiar beloved Earth-disc hanging poised up near the zenith. From thinnest crescent to full Earth, and then steadily back again to crescent.

All so abnormal, irrational, disturbing to human senses. With the mining work over, an irritability grew upon Grantline's men. And perhaps since the

human mind is so wonderful, elusive a thing, there lay upon these men an indefinable sense of impending disaster. Johnny Grantline felt it. He thought about it now as he sat in the room corner watching Wilks being forced into the plaget-game, and he found it strong within him. Unreasonable, ominous depression! Barring the accident which had disabled his little space-ship when they reached this small crater hole, his expedition had gone well. His instruments, and the information he had from the former explorers, had picked up the ore-vein with a scant month of search.

The vein had now been exhausted; but the treasure was here. Nothing was left but to wait for the *Planetara*. The men were talking of that now.

"She ought to be well mid-way from here to Ferrok-Shahn by now. When do you figure she'll be back here, and signal us?"

"Twenty days. Give her another five now to Mars, and five in port. That's ten. We'll pick her signals in three weeks, mark me."

"Three weeks! Just give me three weeks of reasonable sunrise and sunset! This cursed Moon! You mean, Williams, next daylight."

"Hah! He's inventing a Lunar language. You'll be a Moon-man yet, if you live here long enough."

Olaf Swenson, the big blond fellow from the Scandia fiords, came and flung himself down by Grantline.

"Ay tank they bane without not enough to do, Commander. If the ore yust would not give out—"

"Three weeks—it isn't very long, Ollie."

"No. Maybe not."

From across the room somebody was saying, "If the *Comet* hadn't smashed on us, damn me but I'd ask the Commander to let some of us take her back. The discarded equipment could go."

"Shut up, Billy. She is smashed."

The little *Comet*, cruising in search of the ore, had come to grief just as the ore was found. It lay now on the crater floor with its nose bashed into an upflung spire of rock. Wrecked beyond repair. Save for the pre-arrangement with the *Planetara*, the Grantline party would have been helpless here on the Moon. Knowledge of that—although no one ever suspected but that the *Planetara* would come safely—served to add to the men's depression. They were cut off, virtually helpless on a strange world. Their signalling devices were inadequate even to reach Earth. Grantline's power batteries were running low.* He could not attempt wide-flung signals without jeopardizing the power necessary for the routine of his camp in the event of the *Planetara* being delayed. Nor was his electro-telescope adequate to pick small objects at any great distance.**

*[The Gravely storage tanks—the power used by the Grantline expedition—were heavy and bulky affairs. Economy of space on the Comet allowed but few of them.]

**[Electro-telescopes of most modern use and power

were too large and used too much power to be available to Grantline.]

All of Grantline's effort, in truth, had gone into equipment for the finding and gathering of the treasure. The safety of the expedition had to that extent been neglected.

Swenson was mentioning that now.

"You all agreed to it," Johnny said shortly. "Every man here voted that, above everything, what we wanted was to get the radium."

A dynamic little fellow, this Johnny Grantline. Short of temper sometimes, but always just, and a perfect leader of men. In stature he was almost as small as Snap. But he was thick-set, with a smooth shaven, keen-eyed, square-jawed face, and a shock of brown tousled hair. A man of thirty-five, though the decision of his manner, the quiet dominance of his voice, made him seem older. He stood up now, surveying the blue-lit glassite room with its low ceiling close overhead. He was bowlegged; in movement he seemed to roll

with a stiff-legged gait like some sea captain of former days on the deck of his swaying ship. Queer-looking figure! Heavy flannel shirt and trousers, boots heavily weighted, and bulky metal-loaded belt strapped about his waist.

He grinned at Swenson. "When we divide this treasure, everyone will be happy, Ollie."

The treasure was estimated by Grantline to be the equivalent of ninety millions in gold-leaf. A hundred and ten millions in the gross as it now stood, with twenty millions to be deducted by the Federated Refiners for reducing it to the standard purity of commercial radium. Ninety millions, with only a million and a half to come off for expedition expenses, and the *Planetara* Company's share another million. A nice little stake.

Grantline strode across the room with his rolling gait.

"Cheer up, boys. Who's winning there? I say, you fellows—"

An audiphone buzzer interrupted him, a call from the duty man in the instrument room of the nearby building.

Grantline clicked the receiver. The room fell into silence. Any call was unusual—nothing ever happened here in the camp.

The duty man's voice sounded over the room.

"Signals coming! Not clear. Will you come over, Commander?"

Signals!

It was never Grantline's way to enforce needless discipline. He offered no objection when every man in the camp rushed through the connecting passages. They crowded the instrument room where the tense duty man sat bending over his helio receivers. The mirrors were swaying.

The duty man looked up and met Grantline's gaze.

"I ran it up to the highest intensity. Commander. We ought to get it—not let it pass."

"Low scale, Peter?"

"Yes. Weakest infra-red. I'm bringing it up, even though it uses too much of our power." The duty man was apologetic.

"Get it," said Grantline shortly.

"I had a swing a minute ago. I think it's the *Planetara*."

"*Planetara!*" The crowding group of men chorused it. How could it be the *Planetara*?

But it was. The call presently came in clear. Unmistakably the *Planetara*, turned back now from her course to Ferrok-Shahn.

"How far away, Peter?"

The duty man consulted the needles of his dial scale.

"Close! Very weak infra-red. But close. Around thirty thousand miles, maybe. It's Snap Dean calling."

The *Planetara* here within thirty thousand miles! Excitement and pleasure swept the room. The *Planetara's* coming had for so long been awaited so eagerly!

The excitement communicated to Grantline. It was unlike him to be incautious; yet now with no thought save that some unforeseen and pleasing circumstance had brought the *Planetara* ahead of time; incautious Grantline certainly was.

"Raise the ore-barrage."

"I'll go! My suit is here."

A willing volunteer rushed out to the ore-shed. The Gamma rays, which in the helio-room of the *Planetara* came so unwelcome to Snap and me, were loosed.

"Can you send, Peter?" Grantline demanded.

"Yes, with more power."

"Use it."

Johnny dictated the message of his location which we received. In his incautious excitement he ignored the secret code.

An interval passed. The ore was occulted again. No message had come from us—just Snap's routine signal in the weak infra-red, which we hoped Grantline would not get.

The men crowding Grantline's instrument room waited in tense silence. Then Grantline tried the telescope. Its current weakened the lights with the drain upon the distributors, and cooled the room with a sudden deadly chill as the Erentz insulating system slowed down.

The duty man looked suddenly frightened. "You'll bulge out our walls, Commander. The internal pressure—"

"We'll chance it."

They picked up the image of the *Planetara*! It came from the telescope and shone clear on the grid—the segment of star-field with a tiny, cigar-shaped blob. Clear enough to be unmistakable. The *Planetara*! Here now over the Moon, almost directly overhead, poised at what the altimeter scale showed to be a fraction under thirty thousand miles.

The men gazed in awed silence. The *Planetara* coming....

But the altimeter needle was motionless. The *Planetara* was hanging poised.

A sudden gasp went about the room. The men stood with whitening faces, gazing at the *Planetara's* image. And at the altimeter needle. It was moving. The *Planetara* was descending. But not with an orderly swoop.

The image showed the ship clearly. The bow tilted up, then dipped down. But then in a moment it swung up

again. The ship turned partly over. Righted itself. Then swayed again, drunkenly.

The watching men were stricken into horrified silence. The *Planetara's* image momentarily, horribly, grew larger. Swaying. Then turning completely over, rotating slowly end over end.

The *Planetara*, out of control, was falling!

Chapter 21 The Wreck of the Planetara

On the *Planetara*, in the helio-room, Snap and I stood with Moa's weapon upon us. Miko held Anita.

Triumphant. Possessive. Then as she struggled, a gentleness came to this strange Martian giant. Perhaps he really loved her. Looking back on it, I sometimes think so.

"Anita, do not fear me." He held her away from him. "I would not harm you. I want your love." Irony came to him. "And I thought I had killed you! But it was only your brother."

He partly turned. I was aware of how alert was his attention. He grinned. "Hold them, Moa—don't let them do anything foolish. So, Anita, you were masquerading to spy upon me? That was wrong of you." He was again ironic.

Anita had not spoken. She held herself tensely away from Miko; she had flashed me a look—just one. What horrible mischance to have brought this catastrophe!

The completion of Grantline's message had come unnoticed by us all.

"Look! Grantline again!" Snap said abruptly.

But the mirrors were steadying. We had no recording-tape apparatus; the rest of the message was lost. The mirrors pulsed and then steadied.

No further message came. There was an interval while Miko waited. He held Anita in the hollow of his great arm.

"Quiet, little bird. Do not fear me. I have work to do,

Anita—this is our great adventure. We will be rich, you and I. All the luxuries three worlds can offer, all for us when this is over. Careful, Moa! This Haljan has no wit."

Well could he say it! I, who had been so witless to let this come upon us! Moa's weapon prodded me. Her voice hissed at me with all the venom of a reptile enraged. "So that was your game, Gregg Haljan! And I was so graceless to admit love for you!"

Snap murmured in my ear, "Don't move, Gregg! She's reckless."

She heard it. She whirled on him. "We have lost George Prince, it seems. Well, we will survive without his ore knowledge. And you, Dean—and this Haljan—mark me, I will kill you both if you cause trouble!"

Miko was gloating. "Don't kill them yet, Moa. What was it Grantline said? Near the crater of Archimedes? Ring us down, Haljan! We'll land."

He signaled the turret. Gave Coniston the Grantline

message, and audiphoned it below to Hahn. The news spread about the ship. The bandits were jubilant.

"We'll land now, Haljan. Ring us down. Come, Anita and I will go with you to the turret."

I found my voice. "To what destination?"

"Near Archimedes. The Apennine side. Keep well away from the Grantline camp. We will probably sight it as we descend."

There was no trajectory needed. We were almost over Archimedes now. I could drop us with a visible, instrumental course. My mind was whirling with a confusion of thoughts. What could we do? What could we dare attempt to do? I met Snap's gaze.

"Ring us down, Gregg," he said quietly.

I nodded. I pushed Moa's weapon away. "You don't need that. I obey orders."

We went to the turret. Moa watched me and Snap, a

grim, cold Amazon. She avoided looking at Anita, whom Miko helped down the ladders with a strange mixture of courtierlike grace and amused irony. Coniston gazed at Anita with falling jaw.

"I say! Not George Prince? The girl—"

"No time for argument now," Miko commanded. "It's the girl, masquerading as her brother. Get below, Coniston. Haljan takes us down."

The astounded Englishman continued gazing at Anita. "I mean to say, where to on the Moon? Not to encounter Grantline at once, Miko? Our equipment is not ready."

"Of course not. We will land well away. He won't be suspicious—we can signal him again after we land. We will have time to plan, to assemble the equipment. Get below, I told you."

The reluctant Coniston left us. I took the controls. Miko, still holding Anita as though she were a child, sat beside me. "We will watch him, little Anita. A

skilled fellow at this sort of work."

I rang my signals for the shifting of the gravity plates. The answer should have come from below within a second or two. But it did not. Miko regarded me with his great bushy eyebrows upraised.

"Ring again, Haljan."

I duplicated. No answer. The silence was frightening. Ominous.

Miko muttered, "That accursed Hahn. Ring again!"

I sent the imperative emergency demand.

No answer. A second or two. Then all of us in the turret were startled. Transfixed. From below came a sudden hiss. It sounded in the turret: it came from shifting-room call-grid. The hissing of the pneumatic valves of the plate-shifters in the lower control room. The valves were opening; the plates automatically shifting into neutral, and disconnecting!

An instant of startled silence. Miko may have realized the significance of what had happened. Certainly Snap and I did. The hissing ceased. I gripped the emergency plate-shifter switch which hung over my head. Its disc was dead! The plates were dead in neutral. In the positions they were only placed while in port! And their shifting mechanisms were imperative!

I was on my feet. "Snap! Good God, we're in neutral!"

Miko, if he had not realized it before, was aware of it now. The Moon-disc moved visibly as the *Planetara* lurched. The vault of the heavens was slowly swinging.

Miko ripped out a heavy oath. "Haljan! What is this?"

He stood up, still holding Anita. But there was nothing that he could do in this emergency. "Haljan—what—"

The heavens turned with a giant swoop. The Moon was over us. It swung in dizzying arc. Overhead, then

back past our stern; under us, then appearing over our bow.

The *Planetara* had turned over. Upending. Rotating, end over end.

For a moment or two I think all of us in that turret stood and clung. The Moon-disc, the Earth, Sun and all the stars were swinging past our windows. So horribly dizzying. The *Planetara* seemed lurching and tumbling. But it was an optical effect only. I stared with grim determination at my feet. The turret seemed to steady.

Then I looked again. That horrible swoop of all the heavens! And the Moon, as it went past, seemed expanded. We were falling! Out of control, with the Moon-gravity pulling us inexorably down!

"That accursed Hahn—" Miko, stricken with his lack of knowledge of these controls, was wholly confused.

A moment only had passed. My fancy that the Moon-disc was enlarged was merely the horror of my

imagination. We had not fallen far enough yet for that.

But we were falling. Unless I could do something, we would crash upon the Lunar surface.

Anita, killed in this *Planetara* turret. The end of everything for us.

Action came to me. I gasped, "Miko, you stay here! The controls are dead! You stay here—hold Anita."

I ignored Moa's weapon which she was still clutching mechanically. Snap thrust her away.

"Sit back! Let us alone! We're falling! Don't you understand?"

This deadly danger, to level us all! No longer were we captors and captured. Not brigands for this moment. No thought of Grantline's treasure! Trapped humans only! Leveled by the common, instinct of self-preservation. Trapped here together, fighting for our lives.

Miko gasped. "Can you—check us? What happened?"

"I don't know. I'll try."

I stood clinging. This dizzying whirl! From the audiphone grid Coniston's voice sounded.

"I say, Haljan, something's wrong! Hahn doesn't signal."

The look-out in the forward tower was clinging to his window. On the deck below our turret a member of the crew appeared, stood lurching for a moment, then shouted, and turned and ran, swaying, aimless. From the lower hull-corridors our grids sounded with the tramping of running steps. Panic among the crew was spreading over the ship. A chaos below decks.

I pulled at the emergency switch again. Dead....

But down below there was the manual controls.

"Snap, we must get down. The signals."

"Yes."

Coniston's voice came like a scream from the grid.
"Hahn is dead—the controls are broken! Hahn is dead!"

We barely heard him. I shouted, "Miko—hold Anita!
Come on, Snap!"

We clung to the ladders. Snap was behind me.
"Careful, Gregg! Good God!"

This dizzying whirl. I tried not to look. The deck under me was now a blurred kaleidoscope of swinging patches of moonlight and shadow.

We reached the deck. Ran, swaying, lurching.

It seemed that from the turret Anita's voice followed us. "Be careful!"

Within the ship our senses steadied. With the rotating, reeling, heavens shut out, there were only the shouts and tramping steps of the panic-stricken

crew to mark that anything was amiss. That, and a pseudo-sensation of lurching caused by the pulsing of gravity—a pull when the Moon was beneath our hull to combine its force with our magnetizers; a lightening when it was overhead. A throbbing, pendulum lurch—that was all.

We ran down to the corridor incline. A white-faced member of the crew, came running up.

"What's happened? Haljan, what's happened?"

"We're falling!" I gripped him. "Get below. Come on with us!"

But he jerked away from me. "Falling?"

A steward came running. "Falling? My God!"

Snap swung at them. "Get ahead of us! The manual controls—our only chance—we need all you men at the compressor pumps!"

But it was an instinct to try and get on deck, as

though here below we were rats caught in a trap. The men tore away from me and ran. Their shouts of panic resounded through the dim, blue-lit corridors.

Coniston came lurching from the control room. "I say —falling! Haljan, my God, look at him!"

Hahn was sprawled at the gravity-plate switchboard. Sprawled, head-down. Dead. Killed by something? Or a suicide?

I bent over him. His hands gripped the main switch. He had ripped it loose. And his left hand had reached and broken the fragile line of tubes that intensified the current of the pneumatic plate-shifters. A suicide? With his last frenzy determined to kill us all?

Then I saw that Hahn had been killed! Not a suicide! In his hand he gripped a small segment of black fabric, a piece torn from an invisible cloak? Was it?

The questions were swept away by the necessity for action. Snap was rigging the hand-compressors. If he could get the pressure back in the tanks....

I swung on Coniston. "You armed?"

"Yes." He was white-faced and confused, but not in a panic. He showed me his heat-ray cylinder. "What do you want me to do?"

"Round up the crew. Get all you can. Bring them here to man these pumps."

He dashed away. Snap shouted after him. "Kill them down if they argue!"

Miko's voice sounded from the turret call grid:
"Falling! Haljan, you can see it now! Check us!"

I did not answer that. I pumped with Snap.

Desperate moments. Or was it an hour? Coniston brought the men. He stood over them with menacing weapon.

We had all the pumps going. The pressure rose a little in the tanks. Enough to shift a bow-plate. I tried it. The plate slowly clicked into a new combination. A

gravity repulsion just in the bow-tip.

I signaled Miko. "Have we stopped swinging?"

"No. But slower."

I could feel it, that lurch of the gravity. But not steady now. A limp. The tendency of our bow was to stay up.

"More pressure, Snap."

"Yes."

One of the crew rebelled, tried to bolt from the room.

"God, we'll crash, caught in here!"

Coniston shot him down.

I shifted another bow-plate. Then two in the stern. The stern-plates seemed to move more readily than the others.

"Run all the stern-plates," Snap advised.

I tried it. The lurching stopped. Miko called. "We're

bow down. Falling!"

But not falling free. The Moon-gravity pull upon us was more than half neutralized.

"I'll go up, Snap, and try the engines. You don't mind staying down? Executing my signals?"

"You idiot!" He gripped my shoulders. His eyes were gleaming, his face haggard, but his pale lips twitched with a smile.

"Maybe it's good-by, Gregg. We'll fall—fighting."

"Yes. Fighting. Coniston, you keep the pressure up."

With the broken set-tubes it took nearly all the pressure to maintain the few plates I had shifted. One slipped back to neutral. Then the pumps gained on it, and it shifted again.

I dashed up to the deck. Ah, the Moon was so close now! So horribly close! The deck shadows were still. Through the forward bow windows the Moon surface

glared up at us.

I reached the turret. The *Planetara* was steady. Pitched bow-down, half falling, half sliding like a rocket downward. The scarred surface of the Moon spread wide under us.

These last horrible minutes were a blur. And there was always Anita's face. She left Miko. Faced with death, he sat clinging. Ignoring her, Moa, too, sat apart. Staring—

And Anita crept to me. "Gregg, dear one. The end...."

I tried the electronic engines from the stern, setting them in the reverse. The streams of their light glowed from the stern, forward along our hull, and flared down from our bow toward the Lunar surface. But no atmosphere was here to give resistance. Perhaps the electronic streams checked our fall a little. The pumps gave us pressure, just in the last minutes, to slide a few of the hull-plates. But our bow stayed down. We slid, like a spent rocket falling.

I recall the horror of that expanding Lunar surface.
The maw of Archimedes yawning. A blob. Widening to
a great pit. Then I saw it was to one side. Rushing
upward.

A phantasmagoria of uprushing crags. Black and gray.
Spires tinged with Earth-light.

"Gregg, dear one—good-by."

Her gentle arms around me. The end of everything for
us. I recall murmuring, "Not falling free, Anita. Some
hull-plates are set."

My dials showed another plate shifting, checking us a
little further. Good old Snap.

I calculated the next best plate to shift. I tried it. Slid
it over. Good old Snap....

Then everything faded but the feeling of Anita's arms
around me.

"Gregg, dear one—"

The end of everything for us....

There was an up-rush of gray-black rock.

An impact....

Chapter 22 The Hiss of Death

I opened my eyes to a dark blur of confusion. My shoulder hurt—a pain shooting through it. Something lay like a weight on me. I could not seem to move my left arm. Very queer! Then I moved it, and it hurt. I was lying twisted: I sat up. And with a rush, memory came. The crash was over. I am not dead. Anita—

She was lying beside me. There was a little light here in this silent blur—a soft, mellow Earth-light filtering in the window. The weight on me was Anita. She lay sprawled, her head and shoulders half way across my lap.

Not dead! Thank God, not dead! She moved. Her arms went around me, and I lifted her. The Earth-light glowed on her pale face; but her eyes opened and she

faintly smiled.

"It's past, Anita! We've struck, and we're still alive."

I held her as though all life's turgid danger were powerless to touch us.

But in the silence my floating senses were brought back to reality by a faint sound forcing itself upon me. A little hiss. The faintest murmuring breath like a hiss. Escaping air!

I cast off her clinging arms. "Anita, this is madness!"

For minutes we must have been lying there in the heaven of our embrace. But air was escaping! The *Planetara's* dome was broken—or cracked—and our precious air was hissing out.

Full reality came to me at last. I was not seriously injured. I found that I could move freely. I could stand. A twisted shoulder, a limp left arm, but they were better in a moment.

And Anita did not seem to be hurt. Blood was upon her. But not her blood.

Beside Anita, stretched face down on the turret grid, was the giant figure of Miko. The blood lay in a small pool against his face. A widening pool.

Moa was here. I thought her body twitched; then was still. This soundless wreckage! In the dim glow of the wrecked turret with its two motionless, broken human figures, it seemed as though Anita and I were ghouls prowling. I saw that the turret had fallen over to the *Planetara's* deck. It lay dashed against the dome-side.

The deck was aslant. A litter of wreckage. A broken human figure showed—one of the crew, who at the last must have come running up. The forward observation tower was down on the chart-room roof: in its metal tangle I thought I could see the legs of the tower look-out.

So this was the end of the brigands' adventure! The *Planetara's* last voyage! How small and futile are human struggles! Miko's daring enterprise—so

villainous, inhuman—brought all in a few moments to this silent tragedy. The *Planetara* had fallen thirty thousand miles. But why? What had happened to Hahn? And where was Coniston, down in this broken hull?

And Snap. I thought suddenly of Snap.

I clutched at my wandering wits. This inactivity was death. The escaping air hissed in my ears. Our precious air, escaping away into the vacant desolation of the Lunar emptiness. Through one of the twisted, slanting dome-windows a rocky spire was visible. The *Planetara* lay bow-down, wedged in a jagged cradle of Lunar rock. A miracle that the hull and dome had held together.

"Anita, we must get out of here!"

I thought I was fully alert now. I recalled that the brigands had spoken of having partly assembled their Moon equipment. If only we could find suits and helmets!

"We must get out," I repeated. "Get to Grantline's camp."

"Their helmets are in the forward storage room, Gregg. I saw them there."

She was staring at the fallen Miko and Moa. She shuddered and turned away and gripped me. "In the forward storage room, by the port of the emergency lock-exit."

If only the exit locks would operate! We must get out of here, but find Snap first. Good old Snap! Would we find him lying dead?

We climbed from the slanting, fallen turret, over the wreckage of the littered deck. It was not difficult, a lightness was upon us. The *Planetara's* gravity-magnetizers were dead: this was only the light Moon-gravity pulling us.

"Careful, Anita. Don't jump too freely."

We leaped along the deck. The hiss of the escaping

pressure was like a clanging gong of warning to tell us to hurry. The hiss of death so close!

"Snap—" I murmured.

"Oh, Gregg. I pray we may find him alive—!"

"And get out. We've got to rush it. Get out and find the Grantline camp."

But how far? Which way? I must remember to take food and water. If the helmets were equipped with admission ports. If we could find Snap. If the exit locks would work to let us out.

With a fifteen foot leap we cleared a pile of broken deck chairs. A man lay groaning near them. I went back with a rush. Not Snap! A steward. He had been a brigand, but he was a steward to me now.

"Get up! This is Haljan. Hurry, we must get out of here. The air is escaping!"

But he sank back and lay still. No time to find if I

could help him: there were Anita and Snap to save.

We found a broken entrance to one of the descending passages. I flung the debris aside and cleared it. Like a giant of strength with only this Moon-gravity holding me, I raised a broken segment of the superstructure and heaved it back.

Anita and I dropped ourselves down the sloping passage. The interior of the wrecked ship was silent and dim. An occasional passage light was still burning. The passage and all the rooms lay askew. Wreckage everywhere: but the double-dome and hull-shell had withstood the shock. Then I realized that the Erentz system was slowing down. Our heat, like our air, was escaping, radiating away, a deadly chill settling upon everything. And our walls were bulging. The silence and the deadly chill of death would soon be here in these wrecked corridors. The end of the *Planetara*. I wondered vaguely if the walls would explode.

We prowled like ghouls. We did not see Coniston. Snap had been by the shifter-pumps. We found him in

the oval doorway. He lay sprawled. Dead? No, he moved. He sat up before we could get to him. He seemed confused, but his senses clarified with the movement of our figures over him.

"Gregg! Why, Anita!"

"Snap! You're all right? We struck—the air is escaping."

He pushed me away. He tried to stand. "I'm all right. I was up a minute ago. Gregg, it's getting cold. Where is she? I had her here—she wasn't killed. I spoke to her."

Irrational!

"Snap!" I held him, shook him. "Snap, old fellow!"

He said, normally. "Easy, Gregg. I'm all right now."

Anita gripped him. "Who, Snap?"

"She! There she is."

Another figure was here! On the grid-floor by the door oval. A figure partly shrouded in a broken invisible cloak and hood. An invisible cloak! I saw a white face with opened eyes regarding me. The face of a girl.

Venza!

I bent down. "You!"

Anita cried, "Venza!"

Venza here? Why—how—my thoughts swept away. Venza here, dying? Her eyes closed. But she murmured to Anita. "Where is he? I want him."

Dying? I murmured impulsively, "Here I am, Venza dear." Gently, as one would speak with gentle sympathy to humor the dying. "Here I am, Venza."

But it was only the confusion of the shock upon her. And it was upon us all. She pushed at Anita. "I want him." She saw me. This whimsical Venus girl! Even here as we gathered, all of us blurred by the shock, confused in the dim, wrecked ship with the chill of

death coming—even here she could make a jest. Her pale lips smiled.

"You, Gregg. I'm not hurt—I don't think I'm hurt." She managed to get herself up on one elbow. "Did you think I wanted you with my dying breath? Why, what conceit! Not you, Handsome Haljan! I was calling Snap."

He was down to her. "We're all right, Venza. It's over. We must get out of the ship—the air is escaping."

We gathered in the oval doorway. We fought the confusion of panic.

"The exit port is this way."

Or was it? I answered Snap, "Yes, I think so."

The ship suddenly seemed a stranger to me. So cold. So vibrationless. Broken lights. These slanting, wrecked corridors. With the ventilating fans stilled, the air was turning fetid. Chilling. And thinning, with escaping pressure, rarifying so that I could feel the

grasp of it in my lungs and the pin-pricks of my burning cheeks.

We started off. Four of us, still alive in this silent ship of death. My blurred thoughts tried to cope with it all. Venza here. I recalled how she had bade me create a diversion when the women passengers were landing on the asteroid. She had carried out her purpose! In the confusion she had not gone ashore. A stowaway here. She had secured the cloak. Prowling, to try and help us, she had come upon Hahn. Had seized his ray-cylinder and struck him down, and been herself knocked unconscious by his dying lunge, which also had broken the tubes and wrecked the *Planetara*. And Venza, unconscious, had been lying here with the mechanism of her cloak still operating, so that we did not see her when we came and found why Hahn did not answer my signals.

"It's here, Gregg."

Snap and I lifted the pile of Moon equipment. We located four suits and helmets and the mechanisms to operate them.

"More are in the chart-room," Anita said.

But we needed no others. I robed Anita, and showed her the mechanisms.

"Yes. I understand."

Snap was helping Venza. We were all stiff from the cold; but within the suits and their pulsing currents, the blessed warmth came again.

The helmets had admission ports through which food and drink could be taken. I stood with my helmet ready. Anita, Venza and Snap were bloated and grotesque beside me. We had found food and water here, assembled in portable cases which the brigands had prepared. Snap lifted them, and signed to me he was ready.

My helmet shut out all sounds save my own breathing, my pounding heart, and the murmur of the mechanism. The blessed warmth and pure air were good.

We reached the hull port-locks. They operated! We went through in the light of the head-lamps over our foreheads.

I closed the locks after us. An instinct to keep the air in the ship for the other trapped humans lying there.

We slid down the sloping side of the *Planetara*. We were unweighted, irrationally agile with the slight gravity. I fell a dozen feet and landed with barely a jar.

We were out on the Lunar surface. A great sloping ramp of crags stretched down before us. Gray-black rock tinged with Earth-light. The Earth hung amid the stars in the blackness overhead like a huge section of glowing yellow ball.

This grim, desolate, silent landscape! Beyond the ramp, fifty feet below us, a tumbled naked plain stretched away into blurred distance. But I could see mountains off there. Behind us the towering, frowning rampart-wall of Archimedes loomed against the sky.

I had turned to look back at the *Planetara*. She lay broken, wedged between spires of upstanding rock. A few of her lights still gleamed. The end of the *Planetara*!

IMAGEDescription

The three grotesque figures of Anita, Venza and Snap

had started off. Hunchback figures with the tanks mounted on their shoulders. I bounded and caught them. I touched Snap. We made audiphone contact.

"Which way do you think?" I demanded.

"I think this way, down the ramp. Away from Archimedes, toward the mountains. It shouldn't be too far."

"You run with Venza. I'll hold Anita."

He nodded. "But we must keep together, Gregg."

We could soon run freely. Down the ramp, out over the tumbled plain. Bounding, grotesque leaping strides. The girls were more agile, more skilful. They were soon leading us. The Earth-shadows of their figures leaped beside them. The *Planetara* faded into the distance behind us. Archimedes stood back there. Ahead, the mountains came closer.

An hour perhaps. I lost count of time. Occasionally we stopped to rest. Were we going toward the Grantline

camp? Would they see our tiny waving headlights?

Another interval. Then far ahead of us on the ragged plain, lights showed! Moving tiny spots of light! Headlights on helmeted figures!

We ran, monstrously leaping. A group of figures were off there. Grantline's party? Snap gripped me.

"Grantline! We're safe, Gregg! Safe!"

He took his bulb-light from his helmet: we stood in a group while he waved it. A semaphore signal.

"*Grantline?*"

And the answer came. "*Yes. You, Dean?*"

Their personal code. No doubt of this—it was Grantline, who had seen the *Planetara* fall and had come to help us.

I stood then with my hand holding Anita. And I whispered, "It's Grantline! We're safe, Anita, my

darling!"

Death had been so close! Those horrible last minutes on the *Planetara* had shocked us, marked us.

We stood trembling. And Grantline and his men came bounding up.

A helmeted figure touched me. I saw through the helmet-pane the visage of a stern-faced, square-jawed, youngish man.

"Grantline? Johnny Grantline?"

"Yes," said his voice at my ear-grid. "I'm Grantline. You're Haljan? Gregg Haljan?"

They crowded around us. Gripped us to hear our explanations.

Brigands! It was amazing to Johnny Grantline. But the menace was over now, over as soon as Grantline had realized its existence. As though the wreck of the *Planetara* were foreordained by an all-wise

Providence, the brigands' adventure had come to tragedy.

We stood for a time discussing it. Then I drew apart, leaving Snap with Grantline. And Anita joined me. I held her arm so that we had audiphone contact.

"Anita, mine."

"Gregg, dear one."

Murmured nothings which mean so much to lovers!

As we stood in the fantastic gloom of the Lunar desolation, with the blessed Earth-light on us, I sent up a prayer of thankfulness. Not that a hundred millions of treasure were saved. Not that the attack upon Grantline had been averted. But only that Anita was given back to me. In moments of greatest emotion the human mind individualizes. To me, there was only Anita.

Life is very strange! The gate to the shining garden of our love seemed swinging wide to let us in. Yet I

recall that a vague fear still lay on me. A premonition?

I felt a touch on my arm. A bloated helmet visor was thrust near my own. I saw Snap's face peering at me.

"Grantline thinks we should return to the *Planetara*. Might find some of them alive."

Grantline touched me. "It's only humanity."

"Yes," I said.

We went back. Some ten of us—a line of grotesque figures bounding with slow, easy strides over the jagged, rock-strewn plain. Our lights danced before us.

The *Planetara* came at last into view. My ship. Again that pang swept me as I saw her. This, her last resting place. She lay here in her open tomb, shattered, broken, unbreathing. The lights on her were extinguished. The Erentz system had ceased to pulse—the heart of the dying ship, for a while beating faintly, but now at rest.

We left the two girls with some of Grantline's men at the admission port. Snap, Grantline and I, with three others, went inside. There still seemed to be air, but not enough so that we dared remove our helmets.

It was dark inside the wrecked ship. The corridors were black; the hull control-rooms were dimly illumined with Earth-light straggling through the windows.

This littered tomb! Already cold and silent with death. We stumbled over a fallen figure. A member of the crew.

Grantline straightened from examining him.

"Dead."

Earth-light fell on the horrible face. Puffed flesh, bloated red from the blood which had oozed from its pores in the thinning air. I looked away.

We prowled further. Hahn lay dead in the pump-room.

The body of Coniston should have been near here. We did not see it.

We climbed up to the slanting littered deck. The dome had not exploded, but the air up here had almost all hissed away.

Again Grantline touched me. "That the turret?"

"Yes."

No wonder he asked! The wreckage was all so formless.

We climbed after Snap into the broken turret room. We passed the body of that steward who just at the end had appealed to me and I had left dying. The legs of the forward look-out still poked grotesquely up from the wreckage of the observatory tower where it lay smashed down against the roof of the chart-room.

We shoved ourselves into the turret. What was this? No bodies here! The giant Miko was gone! The pool of his blood lay congealed into a frozen dark splotch on

the metal grid.

And Moa was gone! They had not been dead. Had dragged themselves out of here, fighting desperately for life. We would find them somewhere around here.

But we did not. Nor Coniston. I recalled what Anita had said: other suits and helmets had been here in the nearby chart-room. The brigands had taken them, and food and water doubtless, and escaped from the ship, following us through the lower admission ports only a few minutes after we had gone out.

We made careful search of the entire ship. Eight of the bodies which should have been here were missing: Miko, Moa, Coniston, and five of the steward-crew.

We did not find them outside. They were hiding near here, no doubt, more willing to take their chances than to yield now to us. But how, in all this Lunar desolation, could we hope to locate them?

"No use," said Grantline. "Let them go. If they want

death—well, they deserve it."

But we were saved. Then, as I stood there, realization leaped at me. Saved? Were we not indeed fatuous fools?

In all these emotion-swept moments since we had encountered Grantline, memory of that brigand ship coming from Mars had never once occurred to Snap or me!

I told Grantline now. His eyes through the visor stared at me blankly.

"What!"

I told him again. It would be here in eight days. Fully manned and armed.

"But Haljan, we have almost no weapons! All my *Comet's* space was taken with mining equipment and the mechanisms for my camp. I can't signal Earth! I was depending on the *Planetara*!"

It surged upon us. The brigand menace past? We were blindly congratulating ourselves on our safety! But it would be eight days or more before in distant Ferrok-Shahn the non-arrival of the *Planetara* would cause any real comment. No one was searching for us—no one was worried over us.

No wonder the crafty Miko was willing to take his chances out here in the Lunar wilds! His ship, his reinforcements, his weapons were coming rapidly!

And we were helpless. Almost unarmed. Marooned here on the Moon with our treasure!

Chapter 23 The Prowling Watchman

Try it again," Snap urged. "Good God, Johnny, we've got to raise some Earth station! Chance it! Use your power—run it up to the full. Chance it!"

We were gathered in Grantline's instrument room. The duty-man, with blanched grim face, sat at his senders. The Grantline crew shoved close around us, tense and silent.

Above everything we must make some Earth station aware of our plight. Conditions were against us. There were very few observers, in the high-powered Earth stations who knew that an exploring party was on the Moon. Perhaps none of them. The Government officials who had sanctioned the expedition—and Halsey and his confrères in the Detective Bureau—were not anticipating trouble now. The *Planetara* was supposed to be well on her course to Ferrok-Shahn. It was when she was due to return that Halsey would be alert.

And it seemed, too, that nature was against us. The

bulging half-Earth* hung poised near the zenith over our little crater. Its rotation through the hours was clearly visible. We timed our signals when the western hemisphere was facing us. But nature was against us. No clouds, no faintest hint of mist could fog the airless Lunar surface.

*[Between the half and the full illumined disc, the complete Earth now was some ten days old.]

But there were continuous clouds over the Americas.

"Try it again," Snap urged.

These bulging walls! Grantline used his power far beyond the limits of safety. He cut down his lights; the telescope intensifiers were permanently disconnected; the ventilators were momentarily stilled, so that the air here in the little room crowded with men rapidly grew fetid. All to save power pressure, that the vital Erentz system might survive.

Even so it was strained to the danger point. The walls seemed to bulge outward with the pressure of the

room, the aluminite braces straining and creaking. And our heat was radiating away; the deadly chill of space crept in.

"Again!" ordered Grantline.

The duty-man flung on the power in rhythmic pulses. In the silence the tubes hissed. The light sprang through the banks of rotating prisms, intensified up the scale until, with a vague, almost invisible beam, it left the last swaying mirror and leaped through our overhead dome into space.

"Commander!" The duty-man's voice carried an appeal. These bulging walls! If they cracked, or even sprung a serious leak, the camp would be uninhabitable....

"Enough," said Grantline. "Switch it off. We'll let it go at that for now."

It seemed that every man in the room had been holding his breath in the darkness. The lights came on again: the Erentz motors accelerated to normal. The

strain on the walls eased up, and the room began warming.

Had the Earth caught our signal? We did not want to waste the power to find out. Our receivers were disconnected. If an answering signal came, we could not know it. One of the men said:

"Let's assume they saw us." He laughed, but it was a high-pitched, tense laugh. "We don't dare even use the telescope. Our rescue ship will be right overhead, visible to the naked eye before we see it. Three days more—that's what I'll give it."

But the three days passed, and no rescue ship came. The Earth was almost at the full. We tried signaling again. Perhaps it got through—we did not know. But our power was weaker now. The wall of one of the rooms sprang a leak, and the men were hours repairing it. I did not say so, but never once did I feel that our signals were seen on Earth. Those cursed clouds! The Earth almost everywhere seemed to have poor visibility.

Four of our eight days of grace were all too soon passed. The brigand ship must be half-way here by now.

They were busy days for us. If we could have captured Miko and his band, our danger would have been less imminent. With the treasure insulated so that its Gamma rays could not betray us, and our camp in darkness, the arriving brigand ship might never find us. But Miko knew our location: he would signal his oncoming ship when it was close and lead it to us.

Three times during those days—and the days which followed them—Grantline sent out searching parties. But it was unavailing. Miko, Moa and Coniston, with their five underlings, could not be found. We searched all the territory from the camp to the *Planetara*, and off to the foot-crags of Archimedes, and a score of miles into the flatness of the Mare Imbrium. There was no sign of the brigands. Yet we knew they could be near here—it was so easy to hide amid the tumbled crags, the ravines, the gullies, the numberless craters and pit-holes: or underground in the vast honeycombed subterranean recesses.

We had at first hoped that the brigands might have perished. But that was soon dispelled! I went—about the third day—with the party that was sent to the *Planetara*. We wanted to salvage such of its equipment, its unbroken power units, as might be available. And Snap and I had worked out an idea which we thought might be of service. We needed some of the *Planetara's* smaller gravity-plate sections. Those in Grantline's wrecked little *Comet* had stood so long that their radiations had gone dead. But the *Planetara's* were still efficacious.

We secured the fragments of Newtonia.* But our hope that Miko might have perished was dashed. He too had returned to the *Planetara*! The evidence was clear before us. The vessel was stripped of all its power units save those which were dead and useless. The last of the food and water stores was taken. The weapons in the chart-room—the Benson curve-lights, bullet projectors, and heat-rays—had vanished.

*[An allusion to the element Newtonia, named in memory of the great founder of celestial mechanics, Sir Isaac Newton. Artificially electronized, this metal

element may be charged either positively or negatively, thus to attract or repel other masses of matter. The gravity plates of all space-ships were built of it.]

Other days passed. The Earth reached the full, and began waning. The twenty-eight day Lunar night was in its last half. No rescue ship came from Earth. We had ceased our efforts to signal, for we needed all our power to maintain ourselves. The camp would be in a state of siege. That was the best we could hope for. We had a few short-range weapons, such as Bensons, heat-rays and rifles. A few hundred feet of effective range was the most any of them could obtain. The heat-rays—in giant form one of the most deadly weapons on Earth—were only slowly efficacious on the airless Moon. Striking an intensely cold surface, their warming radiations, without atmosphere to aid them, were slow to act. Even in a blasting heat-beam a man in his Erentz helmet-suit could withstand the ray for several minutes.

We were, however, well equipped with explosives. Grantline had brought a large supply for his mining

operations, and much of it was still unused. We had, also, an ample stock of oxygen fuses, and a variety of oxygen light flares in small fragile glass-globes.

It was to use these explosives against the brigands that Snap and I were working out our scheme with the gravity-plates. The brigand ship would come with giant projectors and with some thirty men. If we could hold out against them for a time, the fact that the *Planetara* was missing would bring us help from Earth.

"A month," said Grantline. "A month at the most. If we can hold them off that long—even in a week or two help may come."

Another day. A tenseness fell on us all, despite the absorption of our feverish activities. To conserve the power, the camp was almost dark, we lived in dim, chill rooms, with just a few weak spots of light outside to mark the watchmen on their rounds. We did not use the telescope,* but there was scarcely an hour when one or the other of the men was not sitting on a cross-piece up in the dome of the little instrument

room, casting tense searching gaze into the black, starry firmament. A ship might appear at any time now—a rescue ship from Earth, or the brigands from Mars.

*[An old-fashioned telescope, of limited field and needing no electronic power, would have been immensely serviceable to Grantline, but his was of the more modern type.]

Anita and Venza during these days could aid us very little save by their cheering words. They moved about the rooms, trying to inspire us; so that all the men, when they might have been humanly sullen and cursing their fate, were turned to grim activity, or grim laughter, making a joke of this coming siege. The morale of the camp now was perfect. An improvement indeed over the inactivity of the former peaceful weeks!

Grantline mentioned it to me. "We'll put up a good fight, Haljan. These fellows from Mars will know they've had a task before they ever sail off with this treasure."

I had many moments alone with Anita. I need not mention them. It seemed that our love was crossed by the stars, with an adverse fate dooming it. And Snap and Venza must have felt the same. Among the men we were always quietly, grimly active. But alone.... I came upon Snap once with his arms around the little Venus girl. I heard him say:

"Accursed luck! That you and I should find each other too late, Venza. We could have a mighty lot of fun in Great-New York together."

"Snap, we will!"

As I turned away, I murmured: "And, pray God, so will Anita and I."

The girls slept together in a small room of the main building. Often during the time of sleep, when the camp was stilled except for the night watch, Snap and I would sit in the corridor near the girls' door-grid, talking of that time when we would all be back on our blessed Earth.

Our eight days of grace were passed. The brigand ship was due—now, to-morrow, or the next day.

I recall, that night, my sleep was fitfully uneasy. Snap and I had a cubby together. We talked, and made futile plans. I went to sleep, but awakened after a few hours. Impending disaster lay heavily on me. But there was nothing abnormal nor unusual in that!

Snap was asleep. I was restless, but I did not have the heart to awaken him. He needed what little repose he could get. I dressed, left our cubby and wandered out into the corridor of the main building.

It was cold in the corridor, and gloomy with the weak blue light. An interior watchman passed me.

"All as usual, Haljan."

"Nothing in sight?"

"No. They're looking."

I went through the connecting corridor to the

adjacent building. In the instrument-room several of the men were gathered, scanning the vault overhead.

"Nothing, Haljan."

I stayed with them awhile, then wandered away. The outside man met me near the admission lock-chambers of the main building. The duty-man here sat at his controls, raising the air-pressure in the locks through which the outside watchman was coming. The relief sat here in his bloated suit, with his helmet on his knees. It was Wilks.

"Nothing yet, Haljan. I'm going up to the peak of the crater to see if anything is in sight. I wish that damnable brigand ship would come and get it over with."

Instinctively we all spoke in half whispers, the tenseness bearing in on us.

The outside man came out of his helmet. He was white and grim, but he grinned at Wilks.

"All is usual." He tried the familiar jest at Wilks, but his voice was flat: "Don't let the Earthlight get you!"

Wilks went out through the portes—a process of no more than a minute. I wandered away again through the corridors.

I suppose it was half an hour later that I chanced to be gazing through a corridor window. The lights along the rocky cliff-edge were tiny blue spots. The head of the stairway leading down to the abyss of the crater floor was visible. The bloated figure of Wilks was just coming up. I watched him for a moment making his rounds. He did not stop to inspect the lights. That was routine; I thought it queer that he passed them.

Another minute passed. The figure of Wilks went with slow bounds over toward the back of the ledge where the glassite shelter housed the treasure. It was all dark off there. Wilks went into the gloom, but before I lost sight of him he came back. As though he had changed his mind he headed for the foot of the staircase which led up the cliff-face to where, at the peak of the little crater, five hundred feet above us,

the narrow observatory platform was perched. He climbed with easy bounds, the light on his helmet bobbing in the gloom.

I stood watching. I could not tell why there seemed to be something queer about Wilks' actions. But I was struck with it, nevertheless. I watched him disappear over the peak of the summit.

Another minute went by. Wilks did not reappear. I thought I could make out his light on the platform up there. Then abruptly a tiny white beam was waving from the observatory platform! It flashed once or twice, then was extinguished. And now I saw Wilks plainly, standing in the Earthlight, gazing down.

Queer actions! Had the Earthlight touched him? Or was that a local signal-call which he had sent out? Why should Wilks be signalling? What was he doing with a hand-helio? Our watchmen, I knew, had no reason to carry one.

And to whom could Wilks be signalling across this Lunar desolation? The answer stabbed at me: to

Miko's band!

I waited another moment. No further light. Wilks was still up there!

I went back to the lock entrance. Spare suits and helmets were here beside the keeper. He gazed at me inquiringly.

"I'm going out, Franck, just for a minute." It struck me that perhaps I was a meddlesome fool. Wilks, of all Grantline's men, was, I knew, most in his commander's trust. The signal could have been some part of this night's ordinary routine, for all I knew.

I was hastily donning an Erentz suit. I added, "Let me out. I just got the idea Wilks is acting queerly." I laughed. "Maybe the Earthlight has touched him."

With my helmet on I went through the locks. Once outside, with the outer panel closed behind me, I dropped the weights from my belt and shoes and extinguished my helmet-light.

Wilks was still up there. Apparently he had not moved. I bounded off across the ledge to the foot of the ascending stairs. Did Wilks see me coming? I could not tell. As I approached the stairs the platform was cut off from my line of vision.

I mounted with bounding leaps. In my flexible gloved hand I carried my only weapon, a small bullet projector with oxygen firing caps for use in this outside near-vacuum. The leaden bullet with its slight mass would nevertheless pierce a man at the distance of twenty feet.

I held the weapon behind me. I would talk to Wilks first.

I went slowly up the last hundred feet. Was Wilks still up there? The summit was bathed in Earthlight. The little metal observatory platform came into view above my head.

Wilks was not there. Then I saw him standing on the rocks nearby, motionless. But in a moment he saw me coming.

I waved my left arm with a gesture of greeting. It seemed to me that he started, made as though to leap away, then changed his mind and waited for me.

I sailed from the head of the staircase with a twenty-foot leap and landed lightly beside him. I gripped his arm for audiphone contact.

"Wilks!"

Through the visors his face was visible. I saw him, and he saw me. And I heard his voice.

"You, Haljan! How nice!"

It was not Wilks, but the brigand Coniston!

Chapter 24 Imprisoned!

The duty-man at the exit locks of the main building stood at his window and watched me curiously. He saw me go up the spider-stairs. He could see the figure he thought was Wilks, standing at the top. He saw me join Wilks, saw us locked together in combat.

For an instant the duty-man stood amazed. There were two fantastic, misshapen figures swaying in the Earthlight five hundred feet above the camp, fighting desperately at the very brink. They were small, dwarfed by distance, alternately dim and bright as they swayed in and out of the shadows. Soon the duty-man could not tell one from the other. Haljan and Wilks—fighting to the death!

The duty-man recovered himself and sprang into action. An interior siren-call was on the instrument panel near him. He rang it, alarming the camp.

The men came rushing to him, Grantline among them.

"What's this? Good God, Franck!"

They saw the silent, deadly combat up there on the cliff. The two figures had fallen together from the observatory platform, dropped twenty feet to a lower landing on the stairs. They lay as though stunned for a moment, then fought on.

Grantline stood stricken with amazement. "That's

Wilks!"

"And Haljan," the duty-man gasped. "Went out—something wrong with Wilks—acting strangely—"

The interior of the camp was in a turmoil. The men awakened from sleep, ran out into the corridors, shouted questions.

"An attack?"

"Is it an attack?"

"The brigands?"

But it was Wilks and Haljan in a fight out there on the cliff. The men crowded at the bulls'-eye windows.

And over all the confusion the alarm siren, with no one thinking to shut it off, was screaming with its electrical voice.

Grantline, stricken for that moment of inactivity, stood gazing. One of the figures broke away from the other,

bounded up to the summit from the stair-platform to which they had fallen. The other followed. They locked together, swaying at the brink. For an instant it seemed to Grantline that they would go over; then they surged back, momentarily out of sight.

Grantline found his wits. "Stop them! I'll go out to stop them! What fools!"

He was hastily donning one of the Erentz suits which stood at the lock entrance. "Shut off that siren, Franck!"

Within a minute Grantline was ready. The duty-man called from the window:

"Still at it! By the infernal, such fools! They'll kill themselves!"

The figures had swayed back into view, then out of sight again.

"Franck, let me out."

Grantline was ready. He stood, helmet in hand.

"I'll go with you, Commander."

But the volunteer was not equipped. Grantline would not wait.

"I'm going at once. Hurry, Franck."

The duty-man turned to his panel. The volunteer shoved a weapon at Grantline. "Here, take this."

Grantline jammed on his helmet.

He moved the few steps into the small air-chamber which was the first of the three pressure locks. Its interior door-panel swung open for him. But the door did not close after him!

Cursing the duty-man's slowness, he waited a few seconds. Then he turned to the corridor. The duty-man came running.

Grantline took off his helmet. "What in hell—"

"Broken! Dead!"

"What!"

"Smashed from outside," gasped the duty-man. "Look there—my tubes—"

The control-tubes of the portes had flashed into a close-circuit and burned out. The admission portes would not open!

"And the pressure controls smashed! Broken from outside—!"

There was no way now of getting out through these pressure-locks. The doors, the entire pressure-lock system, was dead. Had it been tampered with from outside?

As though to answer Grantline's amazed question there came a chorus of shouts from the men at the corridor windows.

"Commander! By God—look!"

A figure was outside, close to the building! Clothed in suit and helmet, it stood, bloated and gigantic. It had evidently been lurking at the porte-entrance, had ripped out the wires there.

It moved past the windows, saw the staring faces of the men, and made off with giant bounds. Grantline reached the window in time to see it vanish around the building corner.

It was a giant figure, larger than a normal Earthman. A Martian?

Up on the summit of the crater the two small figures were still fighting. All this turmoil had taken no more than a minute or two.

A lurking Martian outside? The brigand, Miko? More than ever, Grantline was determined to get out. He shouted to his men to don some of the other suits, and called for some of the hand bullet projectors.

But he could not get out through these main admission portes. He could have forced the panels

open perhaps; but with the pressure-changing mechanisms broken, it would merely let the air out of the corridor. A rush of air, probably uncontrollable. How serious the damage was no one could tell as yet. It would perhaps take hours to repair it.

Grantline was shouting. "Get those weapons! That's a Martian outside! The brigand leader, probably! Get into your suits, anyone who wants to go with me! We'll go by the manual emergency exit!"

But the prowling Martian had found it! Within a minute Grantline was there. It was a smaller, two-lock gateway of manual control, so that the person going out could operate it himself. It was in a corridor at the other end of the main building. But Grantline was too late! The lever would not open the panels!

Had someone gone out this way and broken the mechanisms after him? A traitor in the camp? Or had someone come in from outside? Or had the skulking Martian outside broken this lock as he had broken the other?

The questions surged on Grantline. His men crowded around him. The news spread. The camp was a prison. No one could get out.

And outside, the skulking Martian had disappeared. But Wilks and Haljan were still fighting. Grantline could see the two figures up on the observatory platform. They bounded apart, then together again. Crazily swaying—bouncing—striking the rail.

They went together in a great leap off the platform onto the rocks, and rolled in a bright patch of Earthlight. First one on top, then the other, they rolled, unheeding, to the brink. Here, beyond the midway ledge which held the camp, it was a sheer drop of a thousand feet, on down to the crater-floor.

The figures were rolling: then one shook himself loose, rose up, seized the other and, with a desperate lunge, shoved him—

The victorious figure drew back to safety. The other fell, hurtling down into the shadows past the camp-level—down out of sight in the darkness of the crater-

floor.

Snap, who was in the group near Grantline at the windows, gasped.

"God! Was that Gregg Haljan who fell?"

No one could say. No one answered. Outside, on the camp-ledge, another helmeted figure now became visible. It was not far from the main building when Grantline first noticed it. It was running fast, bounding toward the spider-staircase. It began mounting.

And now still another figure became visible—the giant Martian again. He appeared from around the corner of the main Grantline building. He evidently saw the winner of the combat on the cliff, who now was standing in the Earthlight, gazing down. And he saw, too, no doubt, the second figure mounting the stairs. He stood quite near the window through which Grantline and his men were gazing, with his back to the building, looking up to the summit. Then he ran with tremendous leaps toward the ascending

staircase.

Was it Haljan standing up there on the summit? Who was it climbing the staircase? And was the third figure Miko?

Grantline's mind framed the questions. But his attention was torn from them, and torn even from the swift silent drama outside. The corridor was ringing with shouts.

"We're imprisoned! Can't get out! Was Haljan killed? The brigands are outside!"

And then an interior audiphone blared a call for Grantline. Someone in the instrument room of the adjoining building was talking:

"Commander, I tried the telescope to see who got killed—"

But he did not say who got killed, for he had greater news.

"Commander! The brigand ship!"

Miko's reinforcements from Mars had come.

Chapter 25 The Combat on the Crater-top

Not Wilks, but Coniston! His drawling, British voice:

"You, Gregg Haljan! How nice!"

His voice broke off as he jerked his arm from me. My hand with the bullet-protector came up, but with a sweeping blow he struck my wrist. The weapon dropped to the rocks.

I fought instinctively, those first moments; my mind was whirling with the shock of surprise. This was not Wilks, but the brigand Coniston.

His blow wrenched him around. Awkward, fighting in the air-puffed suits, with only a body-weight of some thirty pounds! Coniston stumbled over the rocks. I had still scarce recovered my wits, but I avoided his outflung arms, and, stooping, tried to recover my revolver. It lay nearby. But Coniston followed my scrambling steps and fell upon me. My foot struck the weapon; it slid away and fell down a crag into a six-foot pit.

We locked together, and when I rose erect he had me around the middle. His voice jangled with broken syllables in my receiver.

"Do for you now, Haljan—"

It was an eery combat. We swayed, shoving, kicking, wrestling. His hold around my middle shut off the Erentz circulation; the warning buzz rang in my ears to mingle with the rasp of his curses. I flung him off, and my tiny Erentz motors recovered. He staggered away, but in a great leap came at me again.

I was taller, heavier and far stronger than Coniston. But I found him crafty, and where I was awkward in handling my lightness, he seemed more skilfully agile.

I became aware that we were on the twenty-foot square grid of the observatory platform. It had a low metal railing. We surged against it. I caught a dizzying glimpse of the abyss. Then it receded as we bounced the other way. And then we fell to the grid. His helmet bashed against mine, striking as though butting with the side of his head to puncture my visor-

panel. His gloved fingers were trying to rip at the fabric around my throat.

As we regained our feet, I flung him off, and bounded, like a diver, head-first into him. He went backward, but skilfully kept his feet, gripped me again and shoved me.

I was tottering at the head of the staircase—falling. But I clutched at him.

We fell some twenty or thirty feet to the next lower spider landing. The impact must have dazed us both. I recall my vague idea that we had fallen down the cliff—my Erentz motors smashed—my air shut off. Then the air came again. The roaring in my ears was stilled; my head cleared, and I found that we were on the landing—fighting.

He presently broke away from me, bounded to the summit, with me after him. In the close confines of the suit I was bathed in sweat, and gasping. I had had no thought to increase the oxygen content of my air. But I sorely needed more oxygen for my laboring,

pounding heart and my panting breath. I fumbled for the oxygen control-lever. I could not find it; or it would not operate.

I realized I was fighting sluggishly, almost aimlessly. But so was Coniston!

It seemed dreamlike. A phantasmagoria of blows and staggering steps. A nightmare with only the horrible vision of this goggled helmet always before my eyes.

It seemed that we were rolling on the ground, back on the summit. The unshadowed Earthlight was clear and bright. The abyss was beside me. Coniston, rolling, was now on top, now under me, trying to shove me over the brink. It was all like a dream—as though I were asleep, dreaming that I did not have enough air.

I strove to keep my senses. He was struggling to roll me over the brink. Ah, that would not do! But I was so tired. One cannot fight without oxygen!

I suddenly knew that I had shaken him off and gained

my feet. He rose up, swaying. He was as tired, confused, half-asphyxiated as I.

The brink of the abyss was behind us. I lunged, desperately shoving, avoiding his clutch.

He went over, and fell soundlessly, his body whirling end over end down into the shadows, far down.

I drew back. My senses faded as I sank panting to the rocks. But with inactivity, my thumping heart quieted. My respirations slowed. The Erentz circulation gained on my poisoned air. It purified.

That blessed oxygen! My head cleared again. Strength came to me. I felt better.

Coniston had fallen to his death. I was victor. I went to the brink, cautiously, for I was still dizzy. I could see, far down there on the crater-floor, a little patch of Earthlight in which a mashed human figure was lying.

I staggered back again. A moment or two must have

passed while I stood there on the summit, with my senses clearing and my strength renewed as the blood-stream cleared in my veins.

I was victor. Coniston was dead. I saw now, down on the lower staircase below the camp-ledge, another goggled figure lying huddled. That was Wilks, no doubt. Coniston had doubtless caught him there, surprised him, killed him.

My attention, as I stood gazing, went down to the camp-buildings. Another figure was outside! It bounded along the ledge, reached the foot of the ascending staircase at the top of which I was standing. With agile leaps, it came mounting at me!

Another brigand! Miko? No, it was not large enough to be Miko, not nearly large enough. I was still confused. I thought of Hahn. But that was absurd. Hahn was in the wreck of the *Planetara*. One of the stewards then....

The figure came up the staircase recklessly, to assail me. I took a step backward, bracing myself to receive

this new antagonist.

And then I saw Miko! Unquestionably he: for there was no mistaking his giant figure. He was down on the camp-ledge, running toward the foot of the staircase, coming up to help this other man in advance of him.

I thought of my revolver. I turned to try and find it. I was aware that the first of my assailants was at the stairhead. I could not locate at once where the revolver had fallen. I would be caught, leaped upon from behind. Should I run?

I swung back to see what the oncoming brigand was doing. He had reached the summit. His arms went up, legs bent under him. With a sailing leap he launched for me. I could have bounded away, but with a last look to locate the revolver, I braced myself for the shock.

The figure hit me. It was small and light in my clutching arms. I recall I saw that Miko was half-way up the staircase. I gripped my assailant. The audiphone contact brought a voice.

"Gregg! Is it you?"

It was Anita clutching at me!

Chapter 26 At Bay

"Gregg, you're safe!"

She had heard the camp corridors resounding with the shouts that Wilks and Haljan were fighting. She had come upon a suit and helmet by the manual emergency lock, had run out through the lock, confused, with her only idea to stop Wilks and me from fighting. Then she had seen one of us killed. Impulsive, barely knowing what she was doing, she mounted the stairs, frantic to find if I were alive.

"Anita!"

Miko was coming! She had not seen him: for she had no thought of brigands—only the belief that either Wilks or I had been killed.

But now, as for an instant we stood together on the rocks near the observation platform, I could see the

towering figure of Miko nearing the top of the stairs.

"Anita, that's Miko! We must run."

Then I saw my bullet projector. It lay in a bowl-like depression quite near us. I jumped for it. And as I tore loose from Anita, she leaped down after me. It was a broken bowl in the rocks, some six feet deep. It was open on the side facing the staircase—a narrow, ravinelike gully, full of gray, broken, tumbled rock-masses. The little gully was littered with crags and boulders. But I could see out through it.

Miko had come to the head of the staircase. He stopped there, his great figure etched sharply by the Earthlight. I think he must have known that Coniston was the one who had fallen over the cliff, as my helmet and Coniston's were different enough for him to recognize which was which. He did not know who I was, but he did know me for an enemy.

He stood now at the summit, peering to see where we had gone. He was no more than fifty feet from us.

"Anita, lie down."

I pulled her down on the rocks. I took aim with the bullet projector. But I had forgotten our helmet-lights. Miko must have seen them just as I pulled the trigger. The flying bullet missed him as he jumped sidewise. He dropped, but I could see him moving in the shadows to where a jutting rock gave him shelter. I fired again.

"Gregg."

I had stood up to take aim. I saw the bullet chip a bit of rock. Anita pulled me sharply down beside her.

"Gregg, he's armed!"

It was his turn to fire. It came—the familiar vague flash of the paralyzing ray. It spat its tint of color on the rocks near us, but could not reach us.

Miko rose a moment later and bounded to another rock. I scrambled up, and shot at him, but missed. Then he crouched and returned my fire from his new

angle; but Anita and I had shifted.

Time passed—only a few moments. I could not see Miko momentarily. Perhaps he was crouching; perhaps he had moved away again. He was, or had been, on slightly higher ground than the bottom of our bowl. It was dim down here where we were lying, but I feared that every moment Miko might appear and strike at us. His ray at any short range would penetrate our visor-panes, even though our suits might temporarily resist it.

"Anita—it's too dangerous here."

Had I been alone, I might perhaps have leaped up to lure Miko. But with Anita I did not dare chance it.

"We've got to get back to the camp," I told her. The audiphone brought her comment:

"Perhaps he has gone."

But he had not. We saw him again, out in a distant patch of Earthlight. He was further from us than

before, but on still higher ground. We had extinguished our small helmet-lights. But he knew we were here, and possibly he could see us. His projector flashed again. But we had again shifted, and were untouched. He was a hundred feet or more away now. His weapon was of longer range than mine. I did not answer his fire, for I could not hope to hit him at such a distance, and the flash of my weapon would help him with his aim.

I murmured to Anita, "We must get out of here."

Yet how did I dare take Anita from these concealing shadows? Miko could reach us so easily as we bounded away, in plain view in the Earthlight of the open summit! We were caught, at bay in this little bowl.

The camp from here was not visible. But out through the broken gully, beyond the staircase top, a white beam of light suddenly came up from below.

"*Haljan.*"

It spelled the signal.

"Haljan."

It was coming from the Grantline instrument room, I knew.

I could answer it with my helmet-light, but I did not dare. I hesitated.

"Try it," urged Anita.

We crouched where we thought we might be safe from Miko's fire. My little light-beam shot up from the bowl. It was undoubtedly visible to the camp.

"Yes? I am Haljan."

And I added:

"Help! Send us help."

I did not mention Anita. Miko could doubtless read these signals. And in the camp they must have missed Anita by now. They answered:

"Cannot—"

I lost the rest of it. There came a flash from Miko's weapon. But it gave us confidence. He could not reach us at the moment.

The Grantline beam repeated:

"Cannot come out. Portes broken. You cannot get in. Stay where you are—an hour or two. We may be able to repair portes."

The portes were broken! Stay here an hour or two! But I could not hold this position against Miko that long! Sooner or later he would find a place from where he could sweep this bowl beyond possibility of our hiding. I saw him running now, well beyond my range, to ferret out another point of vantage.

I extinguished my light. What use was it to tell Grantline anything further? Besides, my light was dangerous.

But the Grantline beam spelled another message:

"The brigand ship is coming! It will be here before we can get out to you! No lights! We will try and hide our location."

And the signal-beam brought a last appeal to me:

"Miko and his men will divulge where we are. Unless you can stop them—"

The beam vanished. The lights of the Grantline camp made a faint glow that showed above the crater-edge. The glow died, as the camp now was plunged into darkness.

Chapter 27 Anita's Plan

We crouched in the shadows, the Earthlight filtering down to us. The skulking figure of Miko had vanished; but he was out there somewhere on the crags I was sure, lurking, maneuvering to where he could strike us with his ray. Anita's metal-gloved hand was on my arm; in my ear diaphragm her voice sounded eager and unmistakable:

"What was the signal, Gregg?"

She could not read the semaphore lights. I told her.

"Oh Gregg, the Martian ship coming!"

Her mind clung to that as the most important thing. But not so myself. To me there was only the realization that Anita was caught out here, almost at the mercy of Miko's ray. Grantline's men could not get out to help us, nor could I get Anita into the camp.

She added, "Where do you suppose the ship is? In telescopic view?"

"Yes—twenty or thirty thousand miles up, probably."

The stars and the Earth were visible over us. Somewhere up there disclosed by Grantline's instrument but not yet discernible to the naked eye, Miko's reinforcements were hovering.

I stood up cautiously to try and locate Miko. Immediately I saw him. He jumped as though fearing

my coming bullet, and I dropped back, barely avoiding his flash, which swept across the top of our bowl.

"Gregg—Gregg, don't take such a chance!"

We lay for a moment in silence. It was horribly nerve-straining. Miko could be creeping up on us. Would he dare chance my sudden fire? Creeping—or would he make a swift, unexpected rush?

The feeling that he was upon us abruptly swept me. I jumped to my feet, against Anita's effort to hold me. But again Miko had vanished. Where was he now?

I sank back. "That ship will be here in a few hours."

I told her what Grantline's signal had suggested: the ship was hovering overhead. It must be fairly close; for Grantline's telescope had revealed its identity as a bandit flyer, unmarked by any of the standard code-identification lights. It was doubtless too far away as yet to have located the whereabouts of Grantline's camp. The Martian brigands knew that we were in the

vicinity of Archimedes, but no more than that.

Searching this glowing Moon surface, our little lights, the tiny local semaphore beams we had momentarily been using, could easily pass unnoticed.

But as the brigand ship approached now—dropping close to Archimedes as it probably would—our danger was that Miko and his men would then signal it, join it, and reveal the camp's location, and the brigand attack would be upon us.

I told this now to Anita. "The signal said, '*Unless you can stop them.*'"

It was an appeal to me. But how could I respond to it? What could I do, alone out here with Anita, to cope with this enemy?

Anita made no comment.

I added, "That ship will land near Archimedes I imagine, within an hour or two! If Grantline can repair his portes, and I can get you inside—"

Again she made no comment. Then suddenly she gripped me. "Gregg, look there!"

Out through the gully break in our bowl the figure of Miko showed! He was running. But not at us. Circling the summit, leaping to keep himself behind the upstanding crags. He passed the head of the staircase; he did not descend it, but headed off along the summit of the curving crater-rim.

I stood up to watch him. He was making off. Abandoning us!

"He's going!"

I let her stand up beside me; cautiously, at first, for it occurred to me that this might be a ruse to cover some other of Miko's men who might be lurking up here.

But the summit seemed clear. The figure of Miko was a thousand feet away now. We could see the tiny blob of it bobbing over the rocks. Then it plunged down—not into the crater-valley, but out toward the open

Moon surface.

Miko had abandoned his attack on us. The reason seemed plain. He had come here from his encampment with Coniston, had sent Coniston ahead to lure and kill Wilks. When this was done, Coniston had flashed his brief signal to Miko, who was hiding nearby.

It was not like the brigand leader to remain in the background. Miko was no coward. But Coniston could impersonate Wilks, whereas Miko's giant stature at once would reveal his identity. Miko had been engaged in smashing the portes. He had looked up and seen me kill Coniston. He had come up to assail me. And then he had read Grantline's signal to me. It was his first knowledge that his ship was at hand. With the camp exits inoperative, Grantline and his men were imprisoned. Miko made an effort to kill me. He did not know my companion was Anita. The effort was taking too long: with the Grantline camp imprisoned and his ship at hand, it was Miko's best move to return to his own camp, rejoin his men, and await their opportunity to signal the ship.

At least, so I reasoned it. Anita and I stood alone.
What could we do?

We went to the brink of the cliff. The unlighted
Grantline buildings showed vaguely in the Earthlight.

I said, "We'll go down, I'll leave you there. You can
wait at the porte. They'll repair it soon, perhaps, and
let you in."

"And what will you do?" she demanded.

I was hurrying her down the stairs. But suddenly she
stopped. "What are you going to do, Gregg?"

I had not intended to tell her. "Hurry, Anita!"

"Why?" She stood stock still. Through the visors I
could see her white face gazing at me rebelliously.

"Why should I hurry, Gregg?"

"Because I want to leave you at the porte. I'm going
after Miko—try and locate where he and his men are

camping."

I had indeed no specific plan as yet. But it seemed useless for me to sit at the porte waiting to be let in.

"But he's gone, Gregg."

She was right on that. Miko was already a mile or more away, down on the outer surface, making off. He would soon be out of sight. It would be impossible to follow him.

"Gregg, let me go with you."

She jerked away from me and bounded back up the staircase. I caught her on the summit.

"Anita!"

"I'm going with you."

"You're going to stay here."

"I'm not!"

This exasperating controversy! And time was so precious!

"Anita, please."

"I'll be safer with you than waiting here, Gregg."

It almost decided me. Perhaps she would. It was only my intention to follow Miko at a distance. And with much more of this delay here, he would be lost to me.

And she added, "Besides, I won't stay, and you can't make me."

We ran along the crater-top. At its distant edge the lower plain spread before us. Far down, and far away on the distant broken surface, the leaping figure of Miko showed.

We plunged down the broken outer slope, reached the level. Soon, as we ran, the little Grantline crater faded behind us.

Anita ran more skillfully than I. Ten minutes or so

passed. We had seen Miko, and the direction he was taking, but down here on the plain we could no longer see him. It struck me that this was purposeless—and dangerous. Suppose Miko were to see us following? Suppose he stopped and lay in ambush to fire at us as we came leaping heedlessly by?

"Anita, wait," I said, checking her.

I drew her down amid a group of tumbled boulders. And then abruptly she clung to me.

"Gregg, I know what we can do! Gregg, don't tell me you won't let me try it!"

I listened to her plan. Incredible! Incredibly dangerous! Yet, as I pondered it, the very daring of the thing seemed the measure of its possible success. The brigands would never imagine we could be so rash!

"But Anita—"

"Gregg, you're stupid!" It was her turn to be

exasperated. In truth, I was indeed in no mood for daring, for my mind was obsessed with Anita's safety. I had been planning that we might see the glow of Miko's encampment, and then return to Grantline and hope that he would have the portes repaired.

"But Gregg—the safety of the treasure—of all the Grantline men...."

"To the infernal with that! It's you—your safety."

"My safety, then! If you put me in the camp and the brigands attack it and I am killed—what then? But this plan of mine, if we can do it, Gregg ... safety, in the end, for all of us."

And it seemed possible. We crouched, discussing it. So daring a thing!

The brigand ship would come down near Archimedes. That was fifty miles from Grantline. The brigands from Mars would not have seen the dark Grantline buildings hidden in the little crater-pit. They would wait for Miko and his men to make their whereabouts

known.

Miko's encampment was ahead of us now, undoubtedly. We had been following him toward the Mare Imbrium; we were at its borders now. Archimedes from here was also about fifty miles.

And Anita proposed that we go to Archimedes, climb in slope and await the coming of the brigand ship. Miko would be off in the Mare Imbrium. Or at least, we hoped so. He would signal his ship. But Anita and I, closer to it, would also signal it—and, posing as brigands, could join it!

"Remember, Gregg, I am Anita Prince, George's sister." Her voice trembled as, she mentioned her dead brother. "They know that George was in Miko's pay, and I am his sister.... It will help convince them."

This daring scheme! If we could join the ship, we might be able to persuade its leader that Miko's distant signals were merely a ruse of Grantline to lure the brigands in that direction. A long-range projector from the ship would kill Miko and his men as they

came forward to join it! And then we could falsely direct the brigands, lead them away from Grantline and the treasure.

"Gregg, we must try it."

Heaven help me, I yielded to her persuasion!

We turned at right angles and ran toward where the distant frowning walls of Archimedes loomed against the starlit sky.

Chapter 28 The Ascent of Archimedes

The broken shaggy ramparts of the giant crater rose above us. We toiled upward, out of the foothills, clinging now to the crags and pitted terraces of the main ascent. An hour had passed since we turned from the borders of the Mare Imbrium. Or was it two hours? I could not tell. I only know that we ran with desperate frantic haste.

Anita would not admit that she was tired. She was more skilful than I in this leaping over the broken rock masses. Yet I felt that her slight strength must give out. It seemed miles up the undulating slopes of the foothills with the black and white ramparts of the massive crater close before us.

And then the main ascent. There were places where, like smooth black frozen ice, the walls rose sheer. We avoided them, toiling aside, plunging into gullies, crossing pits where sometimes we perforce went downwards, and then up again; or sometimes we stood, hot and breathless, upon ledges, recovering

our strength, selecting the best route upward.

This tumbled mass of rock! Honeycombed everywhere with caves and passages leading into darkness impenetrable. There were pits into which we might so easily have fallen; ravines to span, sometimes with a leap, sometimes by a long and arduous detour.

Endless climb! We came to a ledge, with the plains of the Mare Imbrium stretching out beneath us. We might have been upon this main ascent for an hour; the plains were far down, the broken surface down there smoothed now by the perspective of our height. And yet still above us the brooding circular wall went up into the sky. Ten thousand feet still above us—I think it was at least that, or more.

"You're tired, Anita. We'd better stay here."

"No! If we could only get to the top—the ship may land on the other side—they would see us if we were at the top."

There was as yet no sign of the brigand ship. With

every stop for rest we searched the starry vault. The Earth hung over us, flattened beyond the full. The stars blazed to mingle with the Earthlight and illumine these massive crags of the Archimedes walls. But no speck appeared to tell us that the ship was up there.

We were on the curving side of the Archimedes wall which fronted the Mare Imbrium to the North. The plains lay like a great frozen sea, congealed ripples shining in the light of the Earth, with dark patches to mark the hollows. Somewhere down there—six or eight thousand feet below us now, or even more than that, for all I could tell—Miko's encampment lay concealed. We searched for lights of it, but could see none.

Or had Miko rejoined his party, left his camp and come here like ourselves to climb Archimedes? Or was our assumption wholly wrong—perhaps the brigand ship would not land near here at all?

Sweeping around from the Mare Imbrium, the plains were less smooth—the shattered, crag-littered, crater-

scarred region beyond which the distant Apennines raised their terraced walls. The little crater which concealed the Grantline camp was off that way. There was nothing to mark it from here.

"Gregg, do you see anything up there? There seems to be a blur."

Her sight, sharper than mine, had picked it out. The descending brigand ship! A faintest tiny blur against the stars, a few of them occulted as though strangely an invisible shadow were upon them. A growing shadow, materializing into a blur—a blob, a shape faintly defined. Then sharper until we were sure of what we saw. It was the brigand ship. It came dropping slowly, silently down.

We crouched on the little ledge. A cave-mouth was behind us. A gully was beside us, a break in the ledge; and at our feet the wall dropped sheer.

We had extinguished our little lights. We crouched, silently gazing up into the stars.

The ship, when first we distinguished it was central over Archimedes. We thought for a while that it might descend into the crater. But it did not; it came sailing forward.

I whispered into the audiphone—whispering by instinct, as though out here in all this airless desolation someone might overhear us!

"It's coming over the crater."

Her hand pressed my arm in answer.

I recalled that when, from the *Planetara*, Miko had forced Snap to signal this brigand band on Mars, Miko's only information as to the whereabouts of the Grantline camp was that it lay between Archimedes and the Apennines. That was Grantline's first message to us, and Miko had relayed it to his men. The brigands from Mars now were following that information.

A tense interval passed. We could see the ship plainly above us now, a gray-black shape among the stars up

beyond the shaggy, towering crater-rim. The vessel came upon a level keel, hull-down, slowly circling, looking for Miko's signal, no doubt, or for possible lights of Grantline. They were also picking a landing place.

We saw it soon as a cylindrical, cigarlike shape, rather smaller than the *Planetara*, but similar of design. It bore lights now. The ports of its hull were tiny rows of illumination, and the glow of light under its rounding upper dome was faintly visible.

A bandit ship, no doubt of that. Its identification keel-plate was empty of official pass-code lights. These brigands had not attempted to secure official sailing lights when leaving Ferrok-Shahn. It was an outlawed ship, unmistakably. And here upon the deserted Moon there was no need for secrecy. Its lights were openly displayed, that Miko might see it and join it.

It went slowly past us, only a few thousand feet higher than our level. We could see the whole outline of its pointed cylinder-hull, with the rounded dome on top. And under the dome was its open deck-space,

with a little cabin superstructure in the center.

I thought for a moment that by some fortunate chance it might land quite near us. There was a wide ledge a quarter of a mile away.

"Anita, look."

But it went past. And then I saw that it was heading for a level, plateau-like surface a few miles further on. It dropped, cautiously floating down.

There was still no sign of Miko. But I realized that haste was necessary. We must be the first to join the brigand ship.

I lifted Anita to her feet. "I don't think we should signal from here."

"No. Miko might see it."

We could not tell where he was. Down on the plains, perhaps? Or up here, somewhere in these miles of towering rocks?

"Are you ready, Anita?"

"Yes, Gregg."

I stared through the visors at her white, solemn face.

"Yes, I'm ready," she repeated.

Her hand-pressure seemed to me suddenly like a farewell. Were we plunging rashly into what was destined to mean our death? Was this a farewell?

An instinct swept me not to do this thing. Why, in an hour or two I could have Anita back to the comparative safety of the Grantline buildings. The exit portes would doubtless be repaired by now. I could get her inside.

She had bounded away from me, leaped down some thirty feet into the broken gully, to cross it and then up on the other side. I stood for an instant watching her fantastic shape, with the great rounded, goggled, trunked helmet and the lump on her shoulders which held the little Erentz motors. Then I made after her.

It did not take us long—two or three miles of circling along the giant wall. The ship lay only a few hundred feet above our level.

We stood at last on a buttelike pinnacle. The hull-port lights of the ship were close over us. And there were moving lights up there, tiny moving spots on the adjacent rocks. The brigands had come out, prowling around to investigate their location.

No signal yet from Miko. But it might come at any moment.

"I'll flash now," I whispered.

"Yes."

The brigands had probably not yet seen us. I took the lamp from my helmet. My hand was trembling.

Suppose my signal were answered by a shot? A flash from some giant projector mounted on the ship?

Anita crouched behind a rock, as she had promised. I stood with my torch, and flung its switch.

My puny light-beam shot up. I waved it, touched the ship with its faint glowing circle of illumination.

They saw me. There was a sudden movement among the lights up there.

I semaphored:

"I am from Miko. Do not fire."

I used the open Universal Code. In Martian first, and then in English.

There was no answer, but no attack. I tried again.

"This is Haljan, once of the Planetara. George Prince's sister is with me. There has been disaster to Miko."

A small light-beam came down from the brink of the overhead cliff beside the ship.

"We read you."

I went steadily on: *"Disaster—the Planetara is wrecked. All killed but me and George Prince's sister."*

We want to join you."

I flashed off my light. The answer came: "*Where is the Grantline camp?*"

"Near here. The Mare Imbrium."

As though to answer my lie, from down on the Earthlit plains, ten miles or so from the crater-base, a tiny signal-light shot up. Anita saw it and gripped me.

"There is Miko's light!"

It spelled in Martian, "*Come down. Land Mare Imbrium.*"

Miko had seen the signalling up here and was joining it! He repeated, "*Land Mare Imbrium.*"

I flashed a protest up to the ship: "*Beware! That is Grantline! Trickery!*"

From the ship the summons came: "*Come up.*"

We had won this first encounter! Miko must have

realized his disadvantage. His distant light went out.

"Come, Anita."

There was no retreat now. But again I seemed to feel in the pressure of her hand that vague farewell.

Her voice whispered, "We must do our best, act our best to be convincing."

In the white glow of a search-beam we climbed the crags, reached the broad upper ledge. Helmeted figures rushed at us, searched us for weapons, seized our helmet lights. The evil face of a giant Martian peered at me through the visors. Two other monstrous, towering figures seized Anita.

We were shoved toward the port-locks at the base of the ship's hull. Above the hull bulge I could see the grids of projectors mounted in the dome-side, and the figures of men standing on the deck, peering down at us.

We went through the admission locks into a hull

corridor, up an incline passage, and reached the lighted deck. Our helmets were taken off. The Martian brigands crowded around us.

Chapter 29 On the Brigand Ship

Anita's words echoed in my memory: "We must act our best to be convincing." It was not her ability that I doubted as much as my own. She had played the part of George Prince cleverly, unmasked only by an evil chance.

I steeled myself to face the searching glances of the brigands as they shoved around us. This was a desperate game into which we had plunged! For all our acting, how easy it would be for some small chance thing abruptly to undo us! I realized it, and now, as I gazed into the peering faces of these men from Mars, I cursed my witless rashness which had brought Anita into this!

The brigands—some ten or fifteen of them here on the deck—stood in a ring around us. They were all big men, nearly of a seven-foot average, dressed in

leather jerkins and short leather breeches, with bare knees and flaring leatherboots. Piratical swaggering fellows, knife-blades mingled with small hand-projectors fastened to their belts. Gray, heavy faces, some with scraggling, unshaved beard. They plucked at us, jabbering in Martian.

One of them seemed the leader. I said sharply, "Are you the commander here? I speak not Ilton* well. You speak the Earth English?"

*[Ilton, the ruling race and official language of the Martian Union.]

"Yes," he said readily, "I am Commander here." He spoke English with the same freedom and accent of Miko. "Is this George Prince's sister?"

"Yes. Her name is Anita Prince. Tell your men to take their hands off her."

He waved his men away. They all seemed more interested in Anita than in me. He added:

"I am Set Potan." He addressed Anita. "George Prince's sister? You are called Anita? I have heard of you. I knew your brother—indeed, you look very much like him."

He swept his plumed hat to the grid with a swaggering gesture of homage. A courtierlike fellow this, debonair as a Venus cavalier!

He accepted us. I realized that Anita's presence was immensely valuable in making us convincing. Yet there was about this Potan—as with Miko—a disturbing suggestion of irony. I could not make him out. I decided that we had fooled him. Then I remarked the steely glitter of his eyes as he turned to me.

"You were an officer of the *Planetara*?"

The insignia of my rank was visible on my white jacket-collar which showed beneath the Erentz suit, now that my helmet was off.

"Yes, I was supposed to be. But a year ago I embarked

upon this adventure with Miko."

He was leading us to his cabin. "The *Planetara* wrecked? Miko dead?"

"And Hahn and Coniston. George Prince, too—we are the only survivors."

While we divested ourselves of our Erentz suits at his command, I told him briefly of the *Planetara's* fall. All had been killed on board save Anita and me. We had escaped, awaited his coming. The treasure was here; we had located the Grantline camp, and were ready to lead him to it.

Did he believe me? He listened quietly. He seemed not shocked at the death of his comrades. Nor yet pleased: merely imperturbable.

I added with a sly, sidelong glance, "There were too many of us on the *Planetara*. The purser had joined us, and many of the crew. And there was Miko's sister, the Setta Moa—too many. The treasure divides better among less."

An amused smile played on his thin gray lips. But he nodded. The fear which had leaped in me was allayed by his next words.

"True enough, Haljan. He was a domineering fellow, Miko. A third of it all was for him alone. But now...."

The third would go to this sub-leader, Potan! The implication was obvious.

I said, "Before we go any further—I can trust you for my share?"

"Of course."

I figured that my very boldness in bargaining so prematurely would convince him. I insisted, "And Miss Prince? She will have her brother's share?"

Clever Anita! She put in swiftly, "I give no information until you promise! We know the location of the Grantline camp, its weapons, its defense, the amount and location of the ore. I warn you, if you do not play us fair...."

He laughed heartily. He seemed to like us. He spread his huge legs as he lounged in his settle, and drank of the bowl which one of his men set before him.

"Little tigress! Fear me not—I play fair!" He pushed two of the bowls across the table. "Drink, Haljan. All is well with us, and I am glad to hear it. Miss Prince, drink my health as your leader."

I waved it away from Anita. "We need all our wits; your strong Martian drinks are dangerous. Look here, I'll tell you just how the situation stands—"

I plunged into a glib account of our supposed wanderings to find the Grantline camp; its location off in the Mare Imbrium—hidden in a cavern there. Potan, with the drink, and under the gaze of Anita's eyes, was in a high good humor. He laughed when I told him that we had dared to invade the Grantline camp, had smashed its exit portes, had even gotten up to have a look at where the ore was piled.

"Well done, Haljan! You're a fellow to my liking!" But his gaze was on Anita. "You dress like a man, or a

charming boy."

She still wore the dark clothes of her brother. She said, "I am used to action—man's garb pleases me. You shall treat me like a man, give me my share of the gold-leaf."

He had already demanded of us the meaning of that signal from the Mare Imbrium. Miko's signal! It had not come again, though any moment I feared it. I told him that Grantline had doubtless repaired his damaged portes and sallied out to assail me in reprisal. And seeing the brigand ship landing on Archimedes, had tried to lure it.

I wondered if my explanation were very convincing. It did not sound so. But he was flushed now with the drink. And Anita added:

"Grantline knows the territory near his camp very well. He is equipped only for short-range fighting."

I took it up. "It's like this, Potan: if he could get you to land unsuspectingly near the mouth of his cavern...."

I pictured how Grantline might have figured on a sudden surprise attack upon the ship. It was his only chance to catch it unprepared.

We were all three in friendly, intimate mood now. Potan said, "We'll land down there right enough! But I need a few hours for my assembling."

"He will not dare advance," I said. "For one thing, he can't leave the treasure."

"He knows we have unmasked his lure," Anita put in smilingly. "Haljan and I joining you—that silenced him. His light went out very promptly, didn't it?"

She flashed me a side-gaze. Were we acting convincingly? But if Miko started up his signals again, they might so quickly betray us! Anita's thoughts were upon that, for she added:

"Grantline will not dare show his light! If he does, Set Potan, we can blast him with a ray from here! Can't we?"

"Yes," Potan agreed. "If he comes within ten miles, I have one powerful enough. We are assembling it now."

"And we have thirty men?" Anita persisted. "When we sail down to attack him it should not be very difficult to kill all the Grantline party. Thirty of us—that's enough to share in this treasure. I'm glad Miko is dead."

"By Heaven, Haljan, this girl of yours is small, but very blood-thirsty!"

"That accursed Miko murdered her brother," I explained.

Acting! And never once did we dare relax! If only Miko's signals would hold off and give us time!

We may have talked for half an hour. We were in a small, steel-lined cubby, located in the forward deck-space of the ship. The dome was over it. I could see from where I sat at the table that there was a forward observatory tower under the dome quite near here.

The ship was laid out in rather similar fashion to the *Planetara*, though considerably smaller.

Potan had dismissed his men from his cubby so as to be alone with us. Out on the deck I could see them dragging apparatus about—bringing the mechanisms of giant projectors up from below, beginning to assemble them. Occasionally some of the men would come to our cubby windows to peer in at us curiously.

My mind was roaming as I talked. For all my manner of casualness, I knew that haste was necessary. Whatever Anita and I were to do must be quickly done. But to win this fellow's utter confidence first was necessary, so that we might have the freedom of the ship, might move about unnoticed, unwatched.

I was horribly tense inside. Through the dome windows across the deck from the cubby the rocks of the Lunar landscape were visible. I could see the brink of this ledge upon which the ship lay, the descending crags down the precipitous wall of Archimedes to the Earthlit plains far below. Miko, Moa, and a few of the *Planetara's* crew were down

there somewhere.

Anita and I had a fairly definite plan. We were now in Potan's confidence. With this interview at an end, I felt that our status among the brigands would be established. We would be free to move about the ship, join in its activities. It ought to be possible to locate the signal-room, get friendly with the operator there.

Perhaps we would find a secret opportunity to flash a signal to Earth. This ship, I was confident, would have the power for a long-range signal, if not of too sustained a length. It was a desperate thing to attempt but our whole procedure was desperate! And I felt—if Anita perhaps could cajole the guard or the duty-man from the signal-room—I might send a single flash or two that would reach the Earth. Just a distress call, signed "Grantline." If I could do that and not get caught.

Anita was engaging Potan in talking of his plans. The brigand leader was boasting of his well-equipped ship, the daring of his men, and questioning her about the size of the treasure. My thoughts were free to

roam.

A signal to Earth. And while we were making friends with these brigands, the longest range electronic projector was being assembled. Miko then could flash his signal and be damned to him! I would be on the deck with that projector. Its operator, and I would turn it upon Miko—one flash of it and he and his little band would be wiped out.

But there was our escape to be thought of. We could not remain very long with these brigands. We could tell them that the Grantline camp was on the Mare Imbrium. It would delay them for a time, but our lie would soon be discovered. We must escape from them, get away and back to Grantline. With Miko dead—a distress signal to Earth—and Potan in ignorance of Grantline's location, the treasure would be safe until help arrived from Earth.

It all fitted together so nicely! It seemed possible of success.

Our futile plans! Star-crossed always, doomed, fated

always to be upset by such unforeseen evil chances!

"By the infernal, little Anita, you look like a dove, but you're a tigress! A comrade after my own heart—blood-thirsty as a fire-worshipper!"

Her laugh rang out to mingle with his. "Oh no, Set Potan! I am treasure-thirsty."

"We'll get the treasure, never fear, little Anita."

"With you to lead us, Potan, I'm sure we will."

A man entered the cubby. Potan looked frowningly around. "What is it, Argle?"

The fellow answered in Martian, leered at Anita and withdrew.

Potan stood up. I noticed that he was unsteady with the drink.

"They want me with the work at the projectors."

"Go ahead," I said.

He nodded. We were comrades now.

"Amuse yourself, Haljan. Or come out on deck if you wish. I will tell my men you are one of us."

"And tell them to keep their hands off Miss Prince."

He stared at me. "I had not thought of that—a woman among so many men."

His own gaze at Anita was as leeringly offensive as any of his men could have given. He said, "Have no fear, little tigress."

Anita laughed. "I am afraid of nothing."

But when he had lurched from the cabin she touched me. Smiled with her mannish swagger, for fear we were still observed, and murmured:

"Oh, Gregg, I am afraid!"

We stayed in the cubby a few moments, whispering—trying to plan.

"You think the signal room is in the tower, Gregg?
This tower outside our window here?"

"Yes, I think so."

"Shall we go out and see?"

"Yes. Keep near me always."

"Oh, Gregg. I will!"

We deposited our Erentz suits carefully in a corner of the cubby. We might need them so suddenly! Then we swaggered out to join the brigands working on the deck.

Chapter 30 Desperate Plans

The deck glowed lurid in the queer blue-greenish glare of Martian electro-fuse lights. It was in a bustle of ordered activity. Some twenty of the crew were scattered about, working in little groups. Apparatus was being brought up from below to be assembled. There was a pile of Erentz suits and helmets, of Martian pattern, but still very similar to those with

which Grantline's expedition was equipped. There were giant projectors of several kinds, some familiar to me, others of a fashion I had never seen before. It seemed there were six or eight of them, still dismantled, with a litter of their attendant batteries and coils and tube-amplifiers. They were to be mounted here on the deck, I surmised; I saw in the dome-side one or two of them already rolled into position at the necessary pressure portes.

Anita and I stood outside Potan's cubby, gazing around us curiously. The men looked at us, but none of them spoke.

"Let's watch from here a moment," I whispered. She nodded, standing with her hand on my arm. I felt that we were very small, here in the midst of these seven-foot Martian men. I was all in white, the costume used in the warm interior of the Grantline camp.

Bareheaded, white silk *Planetara* uniform jacket, broad belt and tight-laced trousers. Anita was a slim black figure beside me, somber as Hamlet, with her pale boyish face and wavy black hair.

The gravity being maintained here on the ship we had found to be stronger than that of the Moon—rather more like Mars.

"There are the heat-rays, Gregg."

A pile of them was visible down the deck-length. And I saw caskets of fragile glass globes, bombs of different styles; hand-projectors of the paralyzing ray; search-beams of several varieties; the Benson curve-light, and a few side-arms of ancient Earth-design—swords and dirks, and small bullet projectors.

There seemed to be some mining equipment also. Far along the deck, beyond the central cabin in the open space of the stern, steel rails were stacked; half a dozen small-wheeled ore-carts; a tiny motor engine for hauling them—and what looked as though it might be the dismembered sections of an ore-shute.

The whole deck was presently strewn with this mass of equipment.

Potan moved about, directing the different groups of

workers. The news had spread that we knew the location of the treasure. The brigands were jubilant. In a few hours the ship's armament would be ready, and it would advance to attack Grantline.

I saw many glances being cast out the dome side-windows toward the distant, far-down plains of the Mare Imbrium. The brigands believed that the Grantline camp lay in that direction.

Anita whispered, "Which is their giant electronic projector, Gregg?"

I could see it amidships of the deck. It was already in place. Potan was there now, superintending the men who were connecting it. The most powerful weapon on the ship, it had, Potan said, an effective range of some ten miles. I wondered what it would do to a Grantline building! The Erentz double walls would withstand it for a time, I was sure. But it would blast an Erentz fabric-suit, no doubt of that. Like a lightning bolt, it would kill—its flashing free-stream of electrons shocking the heart, bringing instant death.

I whispered, "We must smash that before we leave! But first turn it on Miko, if he signals now."

I was tensely watchful for that signal. The electronic projector obviously was not yet ready. But when it was connected, I must be near it, to persuade its duty-man to fire it on Miko. With this done we would have more time to plan our other tasks. I did not think Potan would be ready for his attack before another time of sleep here in the ship's routine. Things would be quieter then—I would watch my chance to send a signal to Earth, and then we would escape.

With my thoughts roving, we had been standing quietly at the cubby door-oval for perhaps fifteen minutes. My hand in my side pouch clutched the little bullet projector. The brigands had taken it from me and given it to Potan. He had placed it on the settle with my Erentz suit; and when we gained his confidence he had forgotten it and left it there. I had it now, and the feel of its cool sleek handle gave me a measure of comfort. Things could go wrong so easily—but if they did, I was determined to sell my life as dearly as possible. And a vague thought was in my

mind: I must not use the last bullet. That would be for Anita.

I shook myself free from such sinister fancy.

"That electronic projector is remote-controlled. Look, Anita—that's the signal room over us. The giant projector will be aimed and fired from up there."

It seemed so. A thirty-foot skeleton tower stood on the deck near us, with a spiral ladder leading up to a small square steel cubby at the top. Through the cubby window-ovals I could see instrument panels. A single Martian was up there; he had called down to Potan concerning the electronic projector.

The roof of this little tower room was close under the dome—a space of no more than four feet. A pressure lock-exit in the dome was up there, with a few steps leading up to it from the roof of the tower signal-room. We could escape that way, perhaps. In the event of dire necessity it might be possible. But only as a desperate resort, for it would put us on the top of the glassite dome, with a sheer hundred feet or more

down its sleek bulging exterior side, and down the outside bulge of the ship's hull, to the rocks below. There might be a spider ladder outside leading downward, but I saw no evidence of it. If Anita and I were forced to escape that way, I wondered how we could manage a hundred foot jump to the rocks and land safely. Even with the slight gravity of the Moon it would be a dangerous fall.

"You are Gregg Haljan?"

I started as one of the brigands, coming up behind us, addressed me.

"Yes."

"Commander Potan tells me you were chief navigator of the *Planetara*?"

"Yes."

"You shall pilot us when we advance upon the Grantline camp. I am control-commander here—Brotow, my name."

He smiled. A giant fellow, but spindly. He spoke good English. He seemed anxious to be friendly.

"We are glad to have you and George Prince's sister with us." He shot Anita an admiring glance. "I will show you our controls, Haljan."

"All right," I said. "Whatever I can do to help...."

"But not now. It will be some hours before we are ready."

I nodded, and he wandered away. Anita whispered:

"Did he mean that signal room up here in the tower? Oh, Gregg, maybe it's only the ship's control room!"

"I don't know. But the projector range-finders are up there, and I think it's the signal room."

"Suppose we go up and see? Gregg, Miko's signals might start any minute."

And the electronic projector now seemed about ready.

It was time for me to act. But a reluctant instinct was upon me. Our Erentz suits were here close behind us in Potan's cubby. I hated to leave them: if anything happened and we had to make a sudden dash, there would be no time to garb ourselves in the suits. To adjust the helmets was bad enough.

I whispered swiftly, "We must get into our suits—find some pretext." I drew her back through the cubby doorway where we would be more secluded.

"Anita, listen: I've been a fool not to plan our escape more carefully! We're in too great a danger here."

It seemed to me suddenly that we were in desperate plight. Was it premonition?

"Anita, listen: if anything happens and we have to make a dash—"

"Up through that dome-lock, Gregg? It's a manual control; you can see the levers."

"Yes. It's a manual. But up there—how would we get

down?"

She was far calmer than I. "There may be an outside ladder, Gregg."

"I don't think so. I haven't seen it."

"Then we can get out the way they brought us in. The hull-port—it's a manual, too."

"Yes, I think I can find our way down through the hull corridors. I mean, for a quick run. If we have to run, you stay close behind me. I've this bullet projector, and evidently there aren't many men in the lower corridors."

"There are guards outside on the rocks."

We had seen them through the dome windows. But there were not many—only two or three. A surprise rush at them would turn the trick.

We donned our Erentz suits.

"What will we do with the helmets?" Anita demanded.
"Leave them here?"

"No—take them with us. I'm not going to get separated from them; it's too dangerous."

"We'll look strange going up to that signal room equipped like this," she commented.

"I can't help it. We'll figure out something to explain it."

She stood before me, a queer-looking little figure in the now deflated, bagging suit with her slim neck and head protruding above the metal circle of its collar.

"Carry your helmet, Anita. I'll take mine."

We could adjust the helmets and start the Erentz motors all within a few seconds.

"I'm ready, Gregg."

"Come on, then. Let me go first."

I had the bullet projector in an outer pouch of the suit where I could instantly reach it. This was more rational: we had a fighting chance now. The fear which had swept me so suddenly began to recede. I was calm.

"We'll climb the tower to the signal room," I whispered. "Do it boldly."

We stepped from the cubby. Potan was not in sight; he was on the further deck beyond the central cabin structure perhaps, or had gone below.

On the deck, we were immediately accosted. This was different—our appearance in the Erentz suits!

"Where are you going?"

This fellow spoke in Martian. I answered in English.

"Up there."

He stood before us, towering over me. I saw a group of nearby workers stop to regard us. In a moment we

would be causing a commotion, and it was the last thing I desired.

I said in Martian, "Commander Potan told me, what I wish I can do. From the dome we look around—see where is the Grantline camp—I am pilot of this ship to go there."

The man who had called himself Brotow passed near us. I appealed to him.

"We put on our suits. I thought we might go up on the dome for a minute and look around. If I'm to pilot the ship...."

He hesitated, his glance sweeping the deck as though to ask Potan. Someone said in Martian:

"The commander is down in the stern storeroom."

It decided Brotow. He waved away the Martian who had stopped me.

"Let them alone."

Anita and I gave him our most friendly smiles.

"Thanks."

He bowed to Anita with a sweeping gesture. "I will show you over the control room presently."

His gaze went to the peak of the bow. The little hooded cubby there was the control room. Satisfaction swept me. Then this, above us in the tower, must surely be the signal room. Would Brotow follow us up? I hoped not. I wanted to be alone with the duty-man up there, giving me a chance to get at the projector controls if Miko's signal should come.

I drew Anita past Brotow, who had stood aside. "Thanks," I repeated. "We won't be long."

We mounted the little ladder.

Chapter 31 In the Tower Cubby

Hurry, Anita!"

I feared that Potan might come up from the hull at

any moment and stop us. The duty-man over us gazed down, his huge head and shoulders blocking the small signal room window. Brotow called up in Martian, telling him to let us come. He scowled, but when we reached the trap in the room floor-grid, we found him standing aside to admit us.

I flung a swift glance around. It was a metallic cubby, not much over fifteen feet square, with an eight-foot arched ceiling. There were instrument panels. The range-finder for the giant projector was here; its little telescope with the trajectory apparatus and the firing switch were unmistakable. And the signalling apparatus was here! Not a Martian set, but a fully powerful Botz ultra-violet helio sender with its attendant receiving mirrors. The *Planetara* had used the Botz system, so I was thoroughly familiar with it. I saw, too, what seemed to be weapons: a row of small fragile glass globes, hanging on clips along the wall—bombs, each the size of a man's fist. And a broad belt with bombs in its padded compartments.

My heart was pounding as my first quick glance took in these details. I saw also that the room had four

small oval window openings. They were breast-high above the floor; from the deck below I knew that the angle of vision was such that the men down there could not see into this room except to glimpse its upper portion near the ceiling. And the helio set was banked on a low table near the floor.

In a corner of the room a small ladder led through a ceiling trap to the cubby roof. This upper trap was open. Four feet above the room-roof was the arch of the dome, with the entrance to the upper exit-lock directly above us. The weapons and the belt of bombs were near this ascending ladder, evidently placed here as equipment for use from the top of the dome.

I turned to the solitary duty-man. I must gain his confidence at once. Anita had laid her helmet aside. She spoke first.

"We were with Set Miko," she said smilingly, "in the wreck of the *Planetara*. You heard of it? We know where the treasure is."

This duty-man was a full seven feet tall, and the most

heavy-set Martian I had ever seen. A tremendous, beetling-browed, scowling fellow. He stood with hands on his hips, his leather-garbed legs spread wide; and as I fronted him I felt like a child. He was silent, glaring down at me as I drew his attention from Anita.

"You speak English? We are not skilled with Martian."

I wondered if at the next time of sleep this fellow would be on duty here. I hoped not; it would not be easy to trick him and find an opportunity to flash a signal. But that task was some hours away as yet; I would worry about it when the time came. Just now I was concerned with Miko and his little band, who at any moment might arrive in sight. If we could persuade this scowling duty-man to turn the projector on them....

He answered me in ready English:

"You are the man Gregg Haljan? And this is the sister of George Prince—what do you want up here?"

"I am a navigator. Brotow wants me to pilot the ship when we advance to attack Grantline."

"This is not the control room."

"No, I know it isn't."

I put my helmet carefully on the floor-grid beside Anita's. I straightened to find the brigand gazing at her. He did not speak; he was still scowling. But in the dim blue glow of the cubby I caught the look in his eyes.

I said hastily, "Grantline knows your ship has landed here on Archimedes. His camp is off there on the Mare Imbrium. He sent up a signal—you saw it, didn't you?—just before Miss Prince and I came aboard. He was trying to pretend that he was your Earth-party, Miko and Coniston."

"Why?"

The fellow turned his scowl on me, but Anita brought his gaze back to her. She put in quickly:

"Grantline, as Brother always said, has no great cunning. I believe he's planning now to creep up on us, catch us unaware by pretending that he is Miko."

"If he does that," I said, "we will turn this electronic projector on him and annihilate him. You have its firing mechanism here."

"Who told you so?" he shot at me.

I gestured. "I see it here. It's obvious. I'm skilled at trajectory-firing. If Grantline appears down there now, I'll help you—"

"Is it connected?" Anita demanded boldly.

"Yes," he said. "You have on your Erentz suits: are you going to the dome-roof? Then go."

But that was what we did not want to do. Anita's glance seemed to tell me to let her handle this. I turned toward one of the cubby windows; she said sweetly:

"Are you in charge of this room? Show me how that projector is operated; it will be invincible against the Grantline camp."

"Yes."

I had my back to them for a moment. Through the breast-high oval I could see down across the deck-space and out through the side dome windows. And my heart suddenly leaped into my throat. It seemed that down there in the Earthlit shadows, where the spreading base of the giant crater joined the plains, a light was bobbing. I gazed, stricken. Miko's lights? Was he advancing, preparing to signal? I tried to gauge the distance; it was not over two miles from here.

Or was it not a light at all? With the naked eye, I could not be sure. Perhaps there was a telescopic finder here in the cubby....

I was subconsciously aware of the voices of Anita and the duty-man behind me. Then abruptly I heard Anita's low cry. I whirled around.

The giant Martian had gathered her into his huge arms, his heavy-jowled gray face with a leering grin close to hers!

He saw me coming. He held her with one arm: his other flung at me, caught me, knocked me backward. He rasped:

"Get out of here! Go up to the dome, leave us."

Anita was silently struggling with her little hands at his thick throat. His blow flung me against a settle. But I held my feet. I was partly behind him. I leaped again, and as he tried to disengage himself from Anita to front me, her clutching fingers impeded him.

My bullet projector was in my hand. But in that second as I leaped, I had the sense to realize I should not fire it and with its noise alarm the ship. I grasped its barrel, reached upward and struck with its heavy metal butt. The blow caught the Martian on the skull, and simultaneously my body struck him.

We went down together, falling partly upon Anita. But

the giant had not cried out, and as I gripped him now, I felt his body limp. I lay panting. Anita squirmed silently from under us. Blood from the giant's head was welling out, hot and sticky against my face as I lay sprawled on him.

I cast him off. He was dead, his fragile Martian skull split open by my blow.

There had been no alarm. The slight noise we made had not been heard down on the busy deck. Anita and I crouched by the floor. From the deck all this part of the room could not be seen.

"Dead!"

"Oh, Gregg—"

It forced our hand. I could not wait now for Miko to come. But I could flash the Earth signal now, and then we would have to make our run to escape.

Abruptly I remembered that light down at the crater-base! I kept Anita out of sight on the floor and went

cautiously to a window. The deck was in turmoil with brigands moving about excitedly. Not because of what had happened in our tower signal room; they were unaware of that.

Miko's signals were showing! I could see them now plainly, down at the crater-base. A group of hand-lights and a small waving helio-beam.

And they were being answered from the ship! Potan was on the deck—a babble of voices, above which his rose with roars of command. At one of the dome windows a brigand with a hand search-beam was sending its answering light. And I saw that Potan was working over a deck telescope-finder.

It had all come so suddenly that I was stunned. But I did not wait to read the signals. I swung back at Anita.

"It's Miko! And they are answering him! Get your helmet; I'll try firing the projector."

Or would I instead try to send a brief flash-signal to

Earth? There would be no time to do both: we must escape out of here. The route up through the dome was the only feasible one now.

This range mechanism of the projector was reasonably familiar, and I felt that I could operate it. The range-finder and switch were on a ledge at one of the windows. I rushed to it. As I swung the little telescope, training it down on Miko's lights, I could see the huge projector on the deck swinging similarly. Its movement surprised the men who were attending it. One of them called up to me, but I ignored him.

Then Potan looked up and saw me. He shouted in Martian at the duty-man, whom he doubtless thought was behind me: "Be ready! We may fire on them, whoever they are. I'll give you the word."

The signals were proceeding. It had only been a moment. I caught something like, "*Haljan is impostor*."

I was aiming the projector. I was aware of Anita at my elbow. I pushed her back.

"Put on your helmet!"

I had the range. I flung the firing switch.

At the deck window the giant projector spat its deadly electronic stream. The men down there leaped away from it with surprise. I heard Potan's voice, his shout of protest and anger.

But down in the Earthglow at the crater-base, Miko's lights had not vanished! I had missed! An error in the range? Abruptly I knew it was not that. Miko's lights were still there. His signals still coming. And I remarked now a faint distortion about them, the glow of his little group of hand-lights faintly distorted and vaguely shot with a greenish cast. Benson curve-lights! I realized it.

My thoughts whirled in the few seconds while I stood there at the tower window. Miko had feared he might summarily be fired upon. He had gone back to his camp, equipped all his lights with the Benson curve. He was somewhere at the crater-base now. But not where I thought I saw him! The Benson curve-light

changed the path of the light-rays traveling from him to me—I could not even approximate his true position!

Anita was plucking at me. "Gregg, come."

"I can't hit him!" I gasped.

Should I try the flash-signal to Earth? Did we dare linger here? I stood another few seconds fascinated at the window. I saw Potan down in the confusion of the deck, training a telescope. He had shouted up violently at his duty-man here not to fire again.

And now he suddenly let out a roar. "I can see them! It's Miko! By the Almighty—his giant stature—Brotow, look! That's not an Earthman!"

He flung aside his little telescope finder. "Disconnect that projector! It's Miko down there! This Haljan is a trickster! Where is he? Braile—Braile, you accursed fool! Are Haljan and the girl up there with you?"

But the duty-man lay weltering in his blood at our

feet.

I had dropped back from the window. Anita and I crouched for an instant in confusion, fumbling with our helmets.

The ship rang with the alarm. And amid the turmoil we could hear the shouts of the infuriated brigands swarming up the tower ladder after us!

Chapter 32 A Speck Amid the Stars

I was only inactive a moment. I had thought Anita would have on her helmet. But she was reluctant, or confused.

"Gregg."

"We've got to get out of here! Up through the overhead locks to the dome."

"Yes—" She fumbled with the helmet. Under the floor-grid the climbing men on the ladder were audible. They were already nearing the top. The trap door was closed: Anita and I were crouching on it. There was a

thick metal bar set in a depressed groove of the grid. I slid it in place—it would seal the trap for a time, at any rate.

A degree of confidence came to me. We had a few moments before there could be any hand-to-hand conflict. That giant electronic projector would eventually be used against Grantline: it was the brigands' most powerful weapon. Its controls were here—by Heaven, I would smash them! That at least I could do!

I jumped for the window. Miko's signals had stopped, but I caught a glimpse of his distant moving curve-lights.

A flash came up at me, as in the window I became visible to the brigands on the ship's deck. It was a small hand-projector, hastily fired, for it went wide of the window. It was followed by a rain of small beams, but I was warned and I dropped my head beneath the high sill. The rays flashed diagonally upward through the oval opening, hissed against our vaulted roof. The air snapped and tingled with a shower of blue-red

sparks, and the acrid odor of the released gases settled down upon me.

The trajectory controls of the projector were beside me. I seized them, ripped and tore at them. There was a roar down on the deck. The projector had exploded. A man's agonized scream split the confusion of sounds.

It silenced the brigands on the deck. Under our floor-grid those on the ladder had been pounding at the trap-door. They stopped, evidently to see what had happened. The bombardment of our windows ceased momentarily.

I cautiously peered out the window again. In the wreck of the projector three men were lying. One of them was screaming horribly. The dome-side was damaged. Potan and other men were frantically investigating to see if the ship's air were hissing out.

A triumph swept me. They had not found me so meek and inoffensive as they might have thought!

Anita clutched at me. She still had not donned her helmet.

"Put it on!"

"But Gregg—"

"Put it on!"

"I—I don't want to put it on until you put yours on."

"I've smashed the projector! We've stopped them coming up for a while."

But they were still on the ladder under our floor. They heard our voices; they began thumping again. Then pounding. They seemed now to have some heavy implement. They rammed with it against the trap.

But the floor seemed holding. The square of metal grid trembled, yielded a little. But it was good for a few minutes longer.

I called down, "The first one who comes through will

be shot." My words mingled with their oaths. There was a moment's pause, then the ramming went on. The dying man on the deck was still screaming.

I whispered, "I'll try an Earth-signal."

She nodded. Pale, tense, but calm. "Yes, Gregg. And I was thinking—"

"It won't take a minute. Have your helmet ready."

"I was thinking—"

She hurried across the room. I swung on the Botz signaling apparatus. It was connected. Within a moment I had it humming. The fluorescent tubes lighted with their lurid glare; they painted purple the body of the giant duty-man who lay sprawled at my feet. I drew on all the ship's power. The tube-lights in the room quivered and went dim.

I would have to hurry. Potan could shut this off from the main hull control room. I could see, through the room's upper trap, the primary sending mirror

mounted in the peak of the dome. It was quivering, radiant with its light-energy. I sent the flash.

The flattened, past-full Earth was up there. I knew that the western hemisphere faced the Moon at this hour. I flashed in English, with the open Universal Earth-code:

"Help! Grantline."

And again: *"Send help! Archimedes region near Apennines. Attacked by brigands. Send help at once! Grantline!"*

If only it would be received! I flung off the current. Anita stood watching me intently. "Gregg, look!"

She had taken some of the glass globe-bombs which lay by the foot of the ascending ladder. She held some of them now.

"Gregg. I threw some."

At the window we gazed down. The globes she flung

had shattered on the deck. They were occulting darkness bombs.*

*[Filled with an odorless, harmless gas, these bombs were used in warfare, taking the place of the old-fashioned smoke screens. The diffusing gas was of such a nature that, when released, it absorbed within itself all the color inherent to the light-rays striking it, thus creating a temporary darkness.]

Through the blackness of the deck, the shouts of the brigands came up. They were stumbling about. But the ramming of our trap went on, and I saw that it was beginning to yield. One corner of it was bent up.

"We've got to go, Anita!"

"Yes."

From out of the darkness which hung like a shroud over the deck an occasional flash came up, unaimed—wide of our windows. But the darkness was dissipating. I could see now the dim glow of the deck lights, blurred as through a heavy fog.

I dropped another of the bombs.

"Put on your helmet."

"Yes—yes, I will. You put on yours."

We had them adjusted in a moment. Our Erentz motors were pumping.

I gripped her. "Put out your helmet-light."

She extinguished it. I handed her my bullet projector.

"Hold it a moment. I'm going to take that belt of bombs."

The trap-door was all but broken under the ramming blows of the men on the ladder. I leaped over the body of the duty-man, seized the belt of bombs and strapped it about my waist.

Anita stood with me.

"Give me the projector."

She handed it to me. The trap-door burst upward! A man's head and shoulders appeared. I fired a bullet into him—the little leaden pellet singing down through the yellow powder-flash that spat from the projector's muzzle.

The brigand screamed, and dropped back out of sight. There was confusion at the ladder-top. I flung a bomb at the broken trap. A tiny heat-ray came wavering up through the opening, but went wide of us.

The instrument room was in darkness. I clung to Anita.

"Hold on to me! You go first—here is the ladder."

We found it in the blackness, mounted it and went through the cubby's roof-trap.

I took a hasty look and dropped another bomb beside us. The four-foot space up here between the cubby roof and the overhead dome went black. We were momentarily concealed.

Anita located the manual levers of the lock-entrance.

"Here, Gregg."

I shoved at them. Fear leaped in me that they would not operate. But they swung. The tiny porte opened wide to receive us. We clambered into the small air-chamber; the door slid closed, just as a flash from below struck at it. The brigands had seen our little cloud of darkness and were firing up through it.

We were through the locks in a moment, out on the open dome-top. A sleek, rounded spread of glassite, with broad aluminite girders. There were cross-ribs which gave us footing, and occasional projections—streamline fin-tips, the casings of the upper rudder shafts, and the upstanding stubby funnels into which the helicopters were folded.

We moved along the central footpath and crouched by a six-foot casing. The stars and the glowing Earth were over us. The curving dome-top—a hundred feet or so in length, and bulging thirty feet wide beneath us—glistened in the Earthlight. It was a sheer drop

down these curving sides past the ship's hull, a hundred feet to the rocks on which the vessel rested. The towering wall of Archimedes was beside us; and beyond the brink of the ledge the thousands of feet down to the plains.

I saw the lights of Miko's band down there. He had stopped signaling. His little lights were spread out, bobbing as he and his men advanced up the crater's foothills, coming to join their ship.

I had an instant's glimpse. Anita and I could not stay here. The brigands would follow us up in a moment. I saw no exterior ladder. We would have to take our chances and jump.

There were brigands down there on the rocks. I saw three or four skulking helmeted figures, and they saw us! A bullet whizzed by us, and then came the flash of a hand-ray.

I touched Anita. "Can you make the leap? Anita, dear...."

Again it seemed that this must be farewell.

"Gregg, dear one—oh, we've got to do it!"

Those waiting figures would pounce on us.

"Anita, lie here a moment."

I jumped up and ran twenty feet toward the bow; then back, toward the stern, flinging down the last of my bombs. The darkness was like a cloud down there, enveloping the outer brigands. But up here we were above it, etched by the starlight and Earthglow.

I came back to Anita.

"We'll have to chance it now."

"Gregg...."

"Good-by, dear. I'll jump first, down this side—you follow."

To leap into that black patch, with the rocks under it....

"Gregg—"

She was trying to tell me to look overhead. She gestured. "Gregg, see!"

I saw it out over the plains—a little speck amid the stars. A moving speck, coming toward us!

"Gregg, what is it?"

I gazed, held my breath. A moving speck out there. A blob now.

And then I realized that it was not a large object, far away, but small, and already very close—only a few hundred feet off, dropping toward the top of our dome. A narrow, flat, ten-foot object, like a wingless volplane. There were no lights on it, but in the Earthlight I could see two crouching, helmeted figures riding it.

"Anita! Don't you remember!"

I was swept with dawning comprehension. Back in the

Grantline camp Snap and I had discussed how to use the *Planetara's* gravity plates. We had gone to the wreck and secured them, had rigged this little volplane flyer....

The brigands on the rocks saw it now. A flash went up at it. One of the figures crouching on it opened a flexible fabric like a wing over its side. I saw another flash from below, harmlessly striking the insulated shield.

I gasped to Anita, "Light your helmet! It's from Grantline! Let them see us!"

I stood erect. The little flying platform went over us, fifty feet up, circling, dropping to the dome-top.

I waved my helmet-light. The exit-lock from below—up which we had come—was near us. The advancing brigands were already in it! I had forgotten to demolish the manuals. And I saw that the darkness down on the rocks was almost gone now, dissipating in the airless night. The brigands down there began firing up at us.

It was a confusion of flashing lights. I clutched at Anita.

"Come this way—run!"

The platform barely missed our heads. It sailed lengthwise of the dome-top, and crashed silently on the central runway near the stern-tip. Anita and I ran to it.

The two helmeted figures seized us, shoved us prone on the metal platform. It was barely four feet wide: a low railing, handles with which to cling, and a tiny hooded cubby in front, with banks of controls.

"Gregg!"

"Snap!"

It was Snap and Venza. She seized Anita, held her crouching in place. Snap flung himself face down at the controls.

The brigands in the lock were out on the dome now. I

took a last shot as we lifted. My bullet punctured one of them; he fell, slid scrambling off the rounded dome and dropped out of sight.

Light-rays and silent flashes seemed to envelop us. Venza held the side-shields higher.

IMAGEDescription

We tilted, swayed crazily, and then steadied.

The ship's dome dropped away beneath us. The rocks of the open ledge were under us. Then the abyss, with the moving climbing specks of Miko's lights far down.

I saw, over the side-shield, the already distant brigand ship resting on the ledge with the massive Archimedes' wall behind it. A confusion back there of futile flashing rays.

It all faded into a remote glow as we sailed smoothly up into the starlight and away, heading for the Grantline camp.

Chapter 33 Besieged!

"Wake up, Gregg! They're coming!"

I forced myself to consciousness. "Coming—"

"Yes. Wake up!"

I leaped from my bunk, followed Snap with a rush into the corridor. We had returned safely to the Grantline Camp. Anita and I found ourselves exhausted from lack of sleep, our arduous climb of Archimedes and that tense time on the brigand ship. On the flight back Snap had explained how the landing of the ship on Archimedes was observed through the Grantline

telescope, using but little of its power for this local range. They had read with amazement my signals to the brigands. Snap had rushed to completion the first of our contemplated flying platforms. Then he had seen Miko's signals from the crater-base, seen the lights of the fight to capture Anita and me in the cubby, and had come to rescue us.

Back at the camp we were given food, and Grantline forced me to try and sleep.

"They'll be on us in a few hours, Gregg. Miko will have joined them by now. He'll lead them to us. You must rest, for we need everyone at his best."

And surprisingly, in the midst of the camp's turmoil of last minute activities, I slept soundly, until Snap called me that the ship was coming.

The corridor echoed with the tramp of Grantline's busy crew. But there was no confusion now; a grim calmness had settled upon everyone.

Anita and Venza rushed up to join us. "It's in sight!"

There was no need of going to the instrument room. From the windows fronting the brink of the cliff the brigand ship was plainly visible. It came sailing from Archimedes, a dark shape blurring the stars. All its lights were extinguished save a single white search-beam in the bow-peak, slanting diagonally down.

The beam presently caught our little group of buildings; its glare shone in the windows as it clung for a moment. I could envisage the triumphant curiosity, of Potan and his fellows up there, gazing along the beam.

Then it swung away. The ship was at an altitude of no more than three thousand feet when I first saw it, coming upon a level keel. Would it circle over us, firing at us? Or sail past, after inspecting us? Or land, perhaps, boldly crowded upon our little ledge?

We were ready—as ready as we could be with our meager equipment. The camp was in a state of siege. The cliff-lights were extinguished: the interior lights were dim, save in the workshops of the main building, where the final assembling of Snap's other flying

platforms and their insulated protective shields was still in progress.

We had dimmed the lights to conserve our power, and to enable the Erentz motors to run at full capacity. Our buildings would have to withstand the brigand rays which soon would be upon us.

Outside on our dim, Earthlit cliff, the tiny lights showed where our few guards were lurking. As I stood at the window watching the oncoming ship, Grantline's voice sounded:

"Call in those men! Ring the call-lights, Franck!"

The siren buzzed over the camp's interior; the warning call-lights on the roof brought in the outer guards. They came running to the admission portes, which had been repaired after Miko disabled them.

The guards came in. We dimmed our lights further. The treasure sheds were black against the cliff behind us. No need for guards there—the bulk of the ore was such that we reasoned the brigands would not

attempt to move it until our buildings were captured. But, if they should try it, we were prepared to sally out with our hand-weapons and defend it.

In the dim lights we crouched. A silence was upon us, save for the clanging in the workshop down the corridor. Most of us wore our Erentz suits, with helmets ready, though I am sure there was not a man of us but who prayed he might not have to go out. At many of the windows—our weakest points to withstand the rays—insulated fabric shields were hung like curtains.

The brigand ship slowly advanced. It was soon over the opposite rim of our little crater. Its search-beam swung about the rim and down into the valley.

My thoughts ran like a turgid stream as I stood tensely watching.

Four hours ago I had sent that flash-signal to Earth. If it were received, a patrol-ship could come to our rescue and arrive here in another eight hours—or perhaps even less.

Ah, that "if!" *If* the signal were received! *If* the patrol-ship were immediately available! *If* it started at once....

Eight hours at the very least. I tried to assure myself that we could hold out that long....

The brigand ship crossed the opposite crater-rim. It dropped lower. It seemed poised over the crater-valley, almost at our own level and less than two miles from us. Its search-beam vanished. For a moment it hung, a sleek, cylindrical silver shape, gleaming in the Earthlight.

Snap looked at me and murmured, "It's descending."

It slowly settled, cautiously picked its landing-place amid the crags and pits of the tumbled scarred valley floor. It came to rest, a vague silver menacing shape lurking in the lower shadows, close at the foot of the inner opposite crater-wall.

A few moments of tense waiting passed. Soon tiny lights were moving down there, some out on the rocks

near the ship, others up under its deck-dome.

A stab of searchlight shot across the valley, swung along our ledge and clung with its glaring ten-foot circle to the front of our main building. Then a ray flashed.

The assault had begun!

Chapter 34 The First Encounters

The besieged Earth-men wage grim, ultra-scientific war with Martian bandits in a last great struggle for their radium-ore—and their lives.

It seemed, with that first shot from the enemy, that a great relief came to me—an apprehension fallen away. We had anticipated this moment for so long, dreaded it. I think all our men felt it. A shout went up:

"Harmless!"

It was not that. But our building withstood it better than I had feared. It was a flash from a large electronic projector mounted on the deck of the brigand ship. It stabbed up from the shadows across the valley at the foot of the opposite crater-wall, a beam of vaguely fluorescent light. Simultaneously the search-light vanished.

The stream of electrons caught the front face of our main building in a six-foot circle. It held a few seconds, vanished; then stabbed again, and still

again. Three bolts. A total, I suppose, of nine or ten seconds.

I was standing with Grantline at a front window. We had rigged an oblong of insulated fabric like a curtain: we stood peering, holding the curtain cautiously aside. The ray struck some twenty feet away from us.

"Harmless!"

The men in the room shouted it with derision. But Grantline swung on them.

"Don't think that!"

An interior signal-panel was beside Grantline. He called the duty-men in the instrument room.

"It's over. What are your readings?"

The bombarding electrons had passed through the outer shell of the building's double-wall, and been absorbed in the rarefied, magnetized air-current of

the Erentz circulation. Like poison in a man's veins, reaching his heart, the free alien electrons had disturbed the motors. They accelerated, then retarded. Pulsed unevenly, and drew added power from the reserve tanks. But they had normalized at once when the shot was past. The duty-man's voice sounded from the grid in answer to Grantline's question:

"Five degrees colder in your building. Can't you feel it?"

The disturbed, weakened Erentz circulation had allowed the outer cold to radiate through a trifle. The walls had had a trifle extra explosive pressure from the room-air. A strain—but that was all.

"It's probably their most powerful single weapon, Gregg." Grantline said.

I nodded. "Yes. I think so."

I had smashed the real giant, with its ten-mile range. The ship was only two miles from us, but it seemed as

though this projector were exerted to its distance limit. I had noticed on the deck only one of this type. The others, paralyzing-rays and heat rays, were less deadly.

Grantline commented: "We can withstand a lot of that bombardment. If we stay inside—"

That ray, striking a man outside, would penetrate his Erentz suit within a few seconds, we could not doubt. We had, however, no intention of going out unless for dire necessity.

"Even so," said Grantline. "A hand-shield would hold it off for a certain length of time."

We had an opportunity a moment later to test our insulated shields. The bolt came again. It darted along the front face of the building, caught our window and clung. The double window-shells were our weakest points. The sheet of flashing Erentz current was transparent: we could see through it as though it were glass. It moved faster, but was thinner at the windows than in the walls. We feared the

bombarding electrons might cross it, penetrate the inner shell and, like a lightning bolt, enter the room.

We dropped the curtain corner. The radiance of the bolt was dimly visible. A few seconds, then it vanished again, and behind the shield we had not felt a tingle.

"Harmless!"

But our power had been drained nearly an aeron, to neutralize the shock to the Erentz current. Grantline said:

"If they kept that up, it would be a question of whose power supply would last longest. And it would not be ours.... You saw our lights fade down while the bolt was striking?"

But the brigands did not know we were short of power. And to fire the projector with a continuous bolt would, in thirty minutes, perhaps, have exhausted their own power-reserve.

This strange warfare! It was new to all of us, for there

had been no wars on any of the three inhabited worlds for many years. Silent, electronic conflict! Not a question of men in battle. A man at a switch on the brigand ship was the sole actor so far in this assault. And the results were visible only in the movement of the needle-dials on our instrument panels. A struggle, so far, not of man's bravery, or skill, or strategy, but merely of electronic power supply.

Yet warfare, however modern, can never transcend the human element. Before this insult was ended I was to have many demonstrations of that!

"I won't answer them," Grantline declared. "Our game is to sit defensive. Conserve everything. Let them make the leading moves."

We waited half an hour, but no other shot came. The valley floor was patched with Earthlight and shadow. We could see the vague outline of the brigand ship backed up at the foot of the opposite crater-wall. The form of its dome over the illumined deck was visible, and the line of its tiny hull ovals.

On the rocks near the ship, helmet-lights of prowling brigands occasionally showed.

Whatever activity was going on down there we could not see with the naked eye. Grantline did not use our telescope at first. To connect it, even for local range, drew on our precious ammunition of power. Some of the men urged that we search the sky with the telescope. Was our rescue ship from Earth coming? But Grantline refused. We were in no trouble yet. And every delay was to our advantage.

"Commander, where shall I put these helmets?"

A man came wheeling a pile of helmets on a little truck.

"At the manual porte—other building."

Our weapons and outside equipment were massed at the main exit-locks of the large building. But we might want to sally out through the smaller locks also. Grantline sent helmets there; suits were not needed, as most of us were garbed in them now, but without

the helmets.

Snap was still in the workshop. I went there during this first half-hour of the attack. Ten of our men were busy there with the little flying platforms and the fabric shields.

"How is it, Snap?"

"Almost all ready."

He had six of the platforms, including the one we had already used, and more than a dozen hand-shields. At a squeeze, all of us could ride on these six little vehicles. We might have to ride them! We planned that, in the event of disaster to the buildings, we could at least escape in this fashion. Food supplies and water were now being placed at the portes.

Depressing preparations! Our buildings uninhabitable, a rush out and away, abandoning the treasure.... Grantline had never mentioned such a contingency, but I noticed, nevertheless, that preparations were being made.

"Only that one shot, Gregg?"

Snap's voice was raised over the clang of the workmen bolting the little gravity-plates of the last platform.

"Four blasts. But just the one projector. Their strongest."

He grinned. He wore no Erentz suit as yet. He stood in torn grimy work-trousers and a bedraggled shirt, with the inevitable red eyeshade holding back his unruly hair. Around his waist was the weighted belt and there were weights on his shoes for gravity stability.

"Didn't hurt us much."

"No."

"When I get the tube-panels in this thing I'll be finished. It'll take another half-hour. I'll join you. Where are you stationed?"

I shrugged. "I was at a front window with Johnny. Nothing to do as yet."

Snap went back to his work. "Well, the longer they delay, the better for us. If only your signal got through, Gregg! We'll have a rescue ship here in a few hours more."

Ah, that "if!"

I turned away. "Can't help you, Snap?"

"No. Take those shields," he added to one of the men.

"Take them where?"

"To Grantline. The front admission porte, or the back. He'll tell you which."

The shields were wheeled away on a little cart. I followed it. Grantline sent it to the back exit.

"No other move from them yet, Johnny?"

"No. All quiet."

"Snap's almost finished."

The brigands presently made another play. A giant heat-ray beam came across the valley. It clung to our front wall for nearly a minute.

Grantline got the reports from the instrument room. He laughed.

"That helped rather than hurt us. Heated the outer wall. Frank took advantage of it and eased up the motors."

We wondered if Miko knew that. Doubtless he did, for another interval passed and the heat-ray was not used again.

Then came a zed-ray. I stood at the window, watching it, faint sheen of beam in the dimness. It crept with sinister deliberation along our front building-wall, clung momentarily to our shielded windows and pried with its revealing glow into Snap's workshop.

"Looking us over," Grantline commented. "I hope they

like what they see."

I knew he did not feel the bravado that was in his tone. We had nothing but small hand weapons: heat-rays, electronic projectors, and bullet projectors. All for very short-range fighting. If Miko had not known that before, he could at least make a good guess at it after the careful zed-ray inspection. With his ship down there two miles away, we were powerless to reach him.

It seemed that Miko was now testing the use of all his mechanisms. A light-flare went up from the dome-peak of the ship. It rose in a slow arc over the valley, and burst. For a few seconds the two-mile circle of crags was brilliantly illumined. I stared, but I had to shield my eyes against the dazzling actinic glare, and I could see nothing. Was Miko making a zed-ray photograph of our interiors? We had no way of knowing.

He was testing his short-range projectors now. With my eyes again accustomed to the normal Earthlight in the valley, I could see the stabs of little electronic

beams, the Martian paralyzing-rays and heat-beams. They darted out like flashing swords from the rocks near the ship.

Then the whole ship and the crater-wall behind it seemed to shift sidewise as a Benson curve-light spread its glow about the ship, with a projector curve-beam coming up and touching the window through which I was peering.

"Haljan, come look at these damn girls! Commander—shall I stop them? They'll kill themselves, or kill us—or smash something!"

We followed the man into the building's broad central corridor. Anita and Venza were riding a midget flying platform! Anita, in her boyish black garb; Venza with a flowing white Venus-robe. They lay on the tiny, six-foot oblong of metal, one manipulating its side shields, the other at the controls. As we arrived, the platform came sliding down the narrow confines of the corridor, lurching, barely missing a door-grid projection. Up to skim the low vaulted ceiling, then down to the floor.

It sailed past our heads, rising over us as we ducked. Anita waved her hand.

Grantline gasped, "By the infernal!"

I shouted, "Anita, stop!"

But they only waved at us, skimming down the length of the corridor, seeming to avoid a smash a dozen times by the smallest margin of chance, stopping miraculously at the further end, hanging poised in mid-air, wheeling, coming back, undulating up and down.

Grantline clung to me. "By the gods of the airways!"

In spite of my astonished horror I could not but share Grantline's obvious admiration. Three of four other men were watching. The girls were amazingly skillful, no doubt of that. There was not a man among us who could have handled that gravity-platform indoors, not one who would have had the brash temerity to try it.

The platform landed with the grace of a humming

bird at our feet, the girls dexterously balancing so that it came to rest swiftly, without the least bump.

I confronted them. "Anita, what are you doing?"

She stood up, flushed and smiling.

"Practising."

Imperturbable girls! The product of their age. Oblivious to the brigand attack, they were in here practising!

"What for?" I demanded.

Venza's roguish eyes twinkled at me. Her hands went to her slim hips with a gesture of defiance.

She asked, "Are you speaking for yourself or the commander?"

I ignored her. "What for?" I reiterated.

"Because we're good at it," Anita retorted. "Better than any of you men. If you should need us...."

"We don't. We won't." I said shortly.

"But if you should...."

Venza put in, "If Snap and I hadn't come for you, you wouldn't be here, Gregg Haljan. I didn't notice you were so horrified to see me holding that shield up over you!"

It silenced me.

She added, "Commander, let us alone. We won't smash anything."

Grantline laughed, "I hope you won't!"

A warning call took us back to the front window. The brigand's search-beam was again being used. It swept slowly along the length of the cliff. Its circle went down the cliff steps to the valley floor, and came sweeping up again. Then it went up to the observatory platform at the summit above us, then back and crept over to the ore-sheds.

We had no men outside, if that was what the brigand wanted to determine. The search-beam presently vanished. It was replaced immediately by a zed-ray, which darted at once to our treasure sheds and clung.

That stung Grantline into his first action. We flung our own zed-ray down across the valley. It reached the brigand ship; this zed-ray and a search-light were our only two projectors of long range.

The brigand ray vanished when ours flashed on. I was with Grantline at an image grid in the instrument room. We saw the deck of the brigand ship and the blurred interior of the cabins.

"Try the search-beam, Franck. We don't need the other."

The zed-ray went off. We gazed down our search-light which clung to the dome of the distant enemy vessel. We could see movement there.

"The telescope," Grantline ordered.

The little dynamos hummed. The telescope-finder glowed and clarified. On the deck of the ship we saw the brigands working with the assembling of ore-carts. A deck landing-port was open. The ore-carts were being carried out through a porte-lock and down a landing incline. And on the rocks outside, we saw several of the carts—and rail-sections and the sections of an ore-shute.

Miko was unloading his mining apparatus! He was making ready to come up for the treasure!

The discovery, startling as it was, nevertheless was far overshadowed by an imperative danger alarm from our main building. Brigands were outside on our ledge! Miko's search-beam, sweeping the ledge a moment before, had carefully avoided revealing them. It had been done just for that purpose, no doubt—making us sure that the ledge was unoccupied and thus to guard against our own light making a search.

But there was a brigand group here close outside our walls! By the merest chance the radiating glow from our search-ray had shown the helmeted figures

scurrying for shelter.

Grantline leaped to his feet.

We rushed for the rear exit-porte which was nearest us. The giant bloated figures had been seen running along the outside of the connecting corridor, in this direction. But before we ever got there, a new alarm came. A brigand was crouching at a front corner of the main building! His hydrogen heat-torch had already opened a rift in the wall!

Chapter 35 Desperate Offensive

"In with you!" ordered Grantline. "Get your helmets on! How many? Six? Enough—get back there, Williams—you were last. The lock won't hold any more."

I was one of the six who jammed into the manual exit lock. We went through it: in a moment we were outside. It was less than three minutes since the prowling brigands had been seen.

Grantline touched me just as we emerged. "Don't wait for orders! Get them!"

"That fellow with the torch, the most dangerous—"

"Yes! I'm with you."

We went out with a rush. We had already discarded our shoe and belt weights. I leaped, regardless of my companions.

The scurrying Martians had disappeared. Through my visor bull's-eye I could see only the Earthlit rocky surface of the ledge. Beside me stretched the dark wall of our building.

I bounded toward the front. The brigand with the torch had been at this front corner. I could not see him from here: he had been crouching just around the angle.

I had a tiny bullet projector, the best weapon for short range outdoors. I was aware of Grantline close behind me.

It took only a few of my giant leaps. I landed at the corner, recovered my balance, and whirled around to the front.

The Martian was here, a giant misshapen lump as he crouched. His torch was a little stab of blue in the deep shadow enveloping him. Intent upon his work, he did not see me. Perhaps he thought his fellows had broken our exits by now.

I landed like a leopard upon his back and fired, my weapon muzzle ramming him. His torch fell hissing with a silent rain of blue fire upon the rocks.

As my grip upon him made audiphone contact, his agonized scream rattled the diaphragms of my ear-grids with horrible, deafening intensity.

He lay writhing under me, then was still. His scream choked into silence. His suit deflated within my encircling grip. He was dead; my leaden, steel-tipped pellet had punctured the double surface of his Erentz-fabric, penetrated his chest.

Grantline's following leap landed him over me.

"Dead?"

"Yes."

I climbed from the inert body. The torch had hissed itself out. Grantline swung on our building corner, and I leaned down with him to examine it. The torch had fused and scarred the surface of the wall, burned almost through. A pressure-rift had opened. We could see it, a curving gash in the metal wall-plate like a crack in a glass window-pane.

I went cold. This was serious damage! The rarefied Erentz-air would seep out. It was leaking now: we could see the magnetic radiance of it all up the length of the ten-foot crack. The leak would change the pressure of the Erentz system, constantly lower it, demanding steady renewal. The Erentz motors would overheat; some might go bad from the strain.

Grantline stood gripping me.

"Damn bad!"

"Yes. Can't we repair it, Johnny?"

"No. Have to take that whole plate-section out, shut off the Erentz plant and exhaust the interior air of all this bulkhead of the building. Day's job—maybe more."

And the crack would get worse, I knew. It would gradually spread and widen. The Erentz circulation would fail. All our power would be drained struggling to maintain it. This brigand who had unwittingly committed suicide by his daring act had accomplished more than he perhaps had realized. I could envisage our weapons, useless from lack of power. The air in our buildings turning fetid and frigid: ourselves forced to the helmets. A rush out to abandon the camp and escape. The buildings exploding—scattering into a litter on the ledge like a child's broken toy. The treasure abandoned, with the brigands coming up and loading it on their ship.

Our defeat. In a few hours now—or minutes. This

crack could slowly widen, or it could break suddenly at any time. Disaster, come now so abruptly upon us at the very start of the brigand attack....

Grantline's voice in my audiphone broke my despairing rush of thoughts. "Bad. Come on, Gregg; nothing to do here."

We were aware that our other four men had run along the building's other side. They emerged now—with the running brigands in front of them, rushing out toward the staircase on the ledge. Three giant Martian figures in flight, with our four men chasing.

A bullet projector spat, with its queer stab of exploding powder fed by the burning oxygen fumes of its artificial air-chamber—one of our men firing. A brigand fell to the rocks by the brink of the ledge. The others reached the descending staircase, tumbled down it with reckless leaps.

Our men turned back. Before we could join them, the enemy ship down in the valley sent up a cautious search-beam which located its returning men. Then

the beam swung up to the ledge, landed upon us.

We stood confused, blinded by the brilliant glare.
Grantline stumbled against me.

"Run, Gregg! They'll be firing at us."

We dashed away. Our companions joined us, rushing back for the porte. I saw it open, reinforcements coming out to help us—half a dozen figures carrying a ten-foot insulated shield. They could barely get it out through the porte.

The Martian search-ray abruptly vanished. Then almost instantly the electronic ray came with its deadly stab. Missed us at first, as we ran for the shield. It vanished, and stabbed again. It caught us, but now we were behind the shield, carrying it back to the porte, hiding behind it.

The ray stabbed once or twice more.

Whether Miko's instruments showed him how serious that damage was to our front wall, we never knew.

But I think that he realized. His search-beam clung to it, and his zed-ray pried into our interiors.

The brigand ship was active now. We were desperate: we used our telescope freely for observation. And used our zed-ray and search-light. Miko's ore-carts and mining apparatus were unloaded on the rocks. The rail-sections were being carried a mile out, nearly to the center of the valley. A subsidiary camp was being established there, only a mile from the base of our cliff, but still far beyond reach of our weapons. We could see the brigand lights down there.

Then the ore-shute sections were brought over. We could see Miko's men carrying some of the giant projectors, mounting them in the new position. Power tanks and cables. Light-flare catapults—little mechanical cannons for throwing the bombs.

The enemy search-light constantly raked our vicinity. Occasionally the giant electronic projector flung up its bolt as though warning us not to dare leave our buildings.

Half an hour went by. Our situation was even worse than Miko could know. The Erentz motors were running hot—our power draining, the crack widening. When it would break we could not tell; but the danger was like a sword over us.

An anxious thirty minutes for us, this second interlude. Grantline called a meeting of all our little force, with every man having his say. Inactivity was no longer a feasible policy. We recklessly used our power to search the sky. Our rescue ship might be up there; but we could not see it with our disabled instruments. No signals came. We could not—or, at least, did not—receive them.

"They wouldn't signal," Grantline protested. "They'd know the Martians would be more likely to get the signal than us. Of what use to warn Miko?"

But he did not dare wait for a rescue ship that might or might not be coming! Miko was playing the waiting game now—making ready for a quick loading of the ore when we were forced to abandon our buildings.

The brigand ship suddenly moved its position! It rose up in a low flat arc, came forward and settled in the center of the valley where the carts and rail-sections were piled, and the outside projectors newly mounted on the rocks. But the projectors only shot at us occasionally.

The brigands now began laying the rails from the ship toward the base of our cliff. The chute would bring the ore down from the ledge, and the carts would take it to the ship.

The laying of the rails was done under cover of occasional stabs from the electronic projector.

And then we discovered that Miko had made still another move. The brigand rays, fired from the depths of the valley, could strike our front building, but could not reach all our ledge. And from the ship's new and nearer position this disadvantage was intensified. Then abruptly we realized that under cover of darkness-bombs an electronic projector and search-ray had been carried to the top of the crater-rim, diagonally across and only half a mile from us.

Their beams shot down, raking all our vicinity from this new angle.

I was on the little flying platform which sallied out as a test to attack these isolated projectors. Snap and I and one other volunteer went. He and I held the shield; Snap handled the controls.

Our exit-porte was on the lee side of the building from the hostile search-beam. We got out unobserved and sailed upward; but soon a light from the ship caught us. And the projector bolts came up....

Our sortie only lasted a few minutes. To me, it was a confusion of crossing beams, with the stars overhead, the swaying little platform under me, and the shield tingling in my hands when the blasts struck us. Moments of blurred terror....

The voice of the man beside me sounded in my ears: "Now, Haljan, give them one!"

We were up over the peak of the rim with the hostile projectors under us. I gauged our movement, and

dropped an explosive powder bomb.

It missed. It flared with a puff on the rocks, twenty feet from where the two projectors were mounted. I saw that two helmeted figures were down there. They tried to swing their grids upward, but could not get them vertical to reach us. The ship was firing at us, but it was far away. And Grantline's search-beam was going full-power, clinging to the ship to dazzle them.

Snap circled us. As we came back I dropped another bomb. Its silent puff seemed littered with flying fragments of the two projectors and the bodies of the men.

We flew swiftly back and got in.

It decided Grantline. For an hour past Snap and I had been urging our plan to use the gravity platforms. To remain inactive was sure defeat now. Even if our buildings did not explode—if we thought to huddle in them, helmeted in the failing air—then Miko could readily ignore us and proceed with his loading of the treasure under our helpless gaze. He could do that

now with safety—if we refused to sally out—for we could not fire our weapons through our windows.*

*[To fire a projector through the walls or windows would at once wreck the protective Erentz system. The enemy ship has pressure portes, constructed for the emission of the weapon-rays. Grantline's only weapons thus mounted were his search-beam and zed-ray.]

To remain defensive would end inevitably in our defeat. We all knew it now; it was obvious. The waiting game was Miko's—not ours! And he was playing it.

The success of our attack upon the distant isolated projectors heartened us. Yet it was a desperate offensive indeed upon which we now decided!

We prepared our little expedition at the larger of the exit portes. Miko's zed-ray was watching all our interior movements. We made a brave show of activity in our workshop with abandoned ore-carts which were stored there. We got them out, started to

recondition them.

It seemed to fool Miko. His zed-ray clung to the workshop, watching us. And at the distant porte we gathered the little platforms, the shields, helmets, bombs, and a few hand-projectors.

There were six platforms—three of us upon each. It left four people to remain indoors.

I need not describe the emotion with which Snap and I listened to Venza and Anita pleading to be allowed to accompany us. They urged it upon Grantline, and we took no part. It was too important a decision. The treasure—the life or death of all these men—hung now upon the fate of our venture. Snap and I could not intrude our personal feelings.

And the girls won. Both were undeniably more skilful at handling the midget platforms than any of us men. Two of the six platforms could be guided by them. That was a third of our little force! And of what use to go out and be defeated, leaving the girls here to meet death almost immediately afterward?

We gathered at the porte. A last minute change made Grantline order six of his men to remain guarding the buildings. The instruments—the Erentz system—all the appliances had to be attended.

It left four platforms, each with three men, with Grantline at the controls of one of them. And upon the other two of the six Venza rode with Snap, and I with Anita.

We crouched in the shadows outside the porte. So small an army, sallying out to bomb this enemy vessel or be killed in the attempt! Only sixteen of us. And thirty or so brigands.

I envisaged then this tiny Moon-crater, the scene of this battle we were waging. Struggling humans, desperately trying to kill. Alone here on this globe. Around us, the wide reaches of Lunar desolation. In all this world, every human being was gathered here, struggling to kill!

Anita drew me down to the platform. "Ready, Gregg."

The others were rising. We lifted, moved slowly out and away from the protective shadows of the building.

In a tiny queue the six little platforms sailed out over the valley toward the brigand ship.

Chapter 36 The Battle in the Crater

Grantline led us. We held about level. Five hundred feet beneath us the brigand ship lay, cradled on the rocks. When it was still a mile away from us I could see all its outline fairly clearly in the dimness. Its tiny hull-windows were now dark; but the blurred shape of the hull was visible and above it the rounded cap of dome, with a dim radiance beneath it.

We followed Grantline's platform. It was rising, drawing the others after it like a tail. I touched Anita where she lay beside me with her head half in the small hooded control-bank.

"Going too high."

She nodded, but followed the line nevertheless. It was

Grantline's command.

I lay crouched, holding the inner tips of the flexible side-shields. The bottom of the platform was covered with the insulated fabric. There were two side-shields. They extended upward some two feet, flexible so that I could hold them out to see over them, or draw them up and in to cover us.

They afforded a measure of protection against the hostile rays, though just how much we were not sure. With the platform level, a bolt from beneath could not harm us unless it continued for a considerable time. But the platform, except upon direct flight, was seldom level, for it was a frail, unstable little vehicle! To handle it was more than a question of the controls. We balanced, and helped to guide it, with the movement of our bodies—shifting our weight sidewise, or back, or forward to make it dip as the controls altered the gravity-pull in its tiny plate-sections.

Like a bird, wheeling, soaring, swooping. To me, it was a precarious business.

But now we were in straight flight diagonally upward. The outline of the brigand ship came under us. I crouched tense, breathless; every moment it seemed that the brigands must discover us and loose their bolts.

They may have seen us for some moments before they fired. I peered over the side-shield down at our mark, then up ahead to get Grantline's firing signal. It seemed long delayed. We were almost over the ship. An added glow down there must have warned Grantline that a shot was coming. The tiny red light flared bright on his platform.

I hissed on our Benson curve-light radiance. We had been dark, but a soft glow now enveloped us. Its sheen went down to the ship to reveal us. But its curving path showed us falsely placed. I saw the little line of platforms ahead of us seem to move suddenly sidewise.

It was everyone for himself now; none of us could tell where the other platforms actually were placed or headed. Anita swooped us sharply down to avoid a

possible collision.

"Gregg—?"

"Yes. I'm aiming."

I was making ready to drop the little explosive globe-bomb. Our search-light ray at the camp, answering Grantline's signal, shot down and bathed the ship in a white glare, revealing it for our aim. Simultaneously the brigand bolts came up at us.

I held my bomb out over the shield, calculating the angle to throw it down. The brigand rays flashed around me. They were horribly close; Miko had understood our sudden visible shift and aimed, not where we appeared to be, but where we had been a moment before.

I dropped my bomb hastily at the glowing white ship. The touch of a hostile ray would have exploded it in my hand. I could see its blue-sizzling fuse as it fell. I saw the others also dropping from our nearby platforms. The explosions from them merged in a

confusion of the white glare—and a cloud of black light-mist as the brigands out on the rocks used their occulting darkness bombs.

We swept past in a blur of leaping hostile beams. Silent battle of lights! Darkness bombs down at the ship struggling to bar our camp search-ray. The Benson radiance-rays from our passing platforms curving down to mingle with the confusion. The electronic rays sending up their bolts....

Our platforms dropped some ten dynamitrine bombs in that first passage over the ship. As we sped by, I dimmed the Benson's radiance. I peered. We had not hit the ship. Or if we had, the damage was inconclusive. But on the rocks I could see a pile of ore-carts scattered—broken wreckage, in which the litter of two or three projectors seemed strewn. And the gruesome deflated forms of several helmeted figures. Others seemed, to be running, scattering—hiding in the rocks and pit-holes. Twenty brigands at least were outside the ship. Some were running over toward the base of our camp-ledge. The darkness bombs were spreading like a curtain over the valley

floor; but it seemed that some of the figures were dragging their projectors away.

We sailed off toward the opposite crater-rim. I remember passing over the broken wreckage of Grantline's little space-ship, the *Comet*. Miko's bolts momentarily had vanished. We had hit some of his outside projectors; the others were abandoned, or being dragged to safer positions.

After a mile we wheeled and went back. I suddenly realized that only four platforms were in the re-formed line ahead of us. One was missing! I saw it now, wavering down, close over the ship. A bolt leaped up diagonally from a distant angle on the rocks and caught the disabled platform. It fell, whirling, glowing red—disappeared into the blur of darkness like a bit of heated metal plunged into water.

One out of six of our platforms already lost! Three men of our little force gone!

But Grantline led us desperately back. Anita caught

his signal to break our line. The five platforms scattered, dipping and wheeling like frightened birds—blurring shapes, shifting unnaturally in flight as the Benson curve-angles were altered.

Anita now took our platform in a long swoop downward. Her tense, murmured voice sounded in my ears:

"Hold off: I'll take us low."

A melee. Passing platform shapes. The darting bolts, crossing like ancient rapiers. Falling blue points of fuse-lights as we threw our bombs.

Down in a swoop. Then rising. Away, and then back. This silent warfare of lights! It seemed that around me must be bursting a pandemonium of sound. Yet I heard nothing. Silent, blurred melee, infinitely frightening. A bolt struck us, clung for an instant; but we weathered it. The light was blinding. Through my gloves I could feel the tingle of the over-charged shield as it caught and absorbed the hostile bombardment. Under me the platform seemed

heated. My little Erentz motors ran with ragged pulse. I got too much oxygen; my head roared with it. Spots danced before my closed eyes. Then not enough oxygen. I was dully smothering....

Then the bolt was gone. I found us soaring upward, horribly tilted. I shifted over.

"Anita! Anita, dear!"

"Yes. Gregg. All right."

The melee went on. The brigand ship and all its vicinity was enveloped in darkness-mist now—a turgid sable curtain, made more dense by the dissipating heavy fumes of our exploding bombs which settled low over the ship and the rocks nearby. The search-light from our camp strove futilely to penetrate the cloud.

Our platforms were separated. One went by high over us; I saw another dart close beneath my shield.

"God, Anita!"

"Too close! I did not mean that—I didn't see it."

Almost a collision.

"Oh, Gregg, haven't we broken the ship's dome yet?"

It seemed not. I had dropped nearly all my bombs. This could not go on much longer. Had it been only five minutes? Only that? Reason told me so, yet it seemed an eternity of horror.

Another swoop. My last bomb. Anita had brought us into position to fling it. But I could not. A bolt stabbed up from the gloom and caught us. We huddled, pulling the shields up and over us.

Blurred darkness again. Too much to the side now. I had to wait while Anita swung us back. Then we seemed too high.

We swooped. But not too low! Down in the darkness-mist we would immediately have lost direction, and crashed.

I waited with my last bomb. The other platforms were occasionally dropping them: I had been too hasty, too prodigal.

Had we broken the ship's dome with a direct hit? It seemed not.

The brigands were occasionally sending up catapulted light-flares. They came from positions on the rocks outside the ship. They mounted in lazy curves and burst over us. The concealing darkness, broken only by the flares of our explosions, enveloped the enemy. Our camp search-light was still struggling with it. But overhead, where the few little platforms were circling and swooping, the flares gave an almost continuous glare. It was dazzling, blinding. Even through the smoked pane which I adjusted to my visor I could not stand it.

But there were thoughts of comparative dimness. In a patch where the Earthlight struck through the darkness of the rocks, I saw another of our fallen platforms! Snap and Venza! Dear God....

It was not they, but three figures of our men. One was dead. Two had survived the fall. They stood up, staggering. And in that instant, before the turgid black curtain closed over them, I saw two brigands come rushing. Their hand projectors stabbed at close range. Our men crumpled and fell.

And now I saw why probably we had never yet hit the ship.

Its outline was revealed. "Now, Gregg—can you fling it from here?"

We were in position again. I flung my last missile, watched its light as it dropped. On the dome-roof two of Miko's men were crouching. My bomb was truly aimed—perhaps one of the few in all our bombardment which would have landed directly on the dome-roof. But the waiting marksmen fired at it with short-range heat projectors and exploded it harmlessly while it was still above them.

We swung up and away. I saw, high above us, Grantline's platform, recognizing its red signal light.

There seemed a lull. The enemy fire had died down to only a very occasional bolt. In the confusion of my whirling impressions I wondered if Miko were in distress? Not that! We had not hit his ship; perhaps we had done little damage indeed! It was we who were in distress. Two of our platforms had fallen—two out of six. Or more, of which I did not know.

I saw one rising off to the side of us. Grantline was over us. Well, we were at least three. And then I saw the fourth.

"Grantline is calling us up, Gregg."

"Yes."

Grantline's signal-light was summoning us from the attack. He was a thousand or two thousand feet above.

I was suddenly shocked with horror. The search-ray from our camp abruptly vanished! Anita wheeled us to face the distant ledge. The camp-lights showed, and over one of the buildings was a distress light!

Had the crack in our front wall broken, threatening explosion of all the buildings? The wild thoughts swept me. But it was not that. I could see light-stabs from the cliff outside the main building. Miko had dared to send some of his men to attack our almost abandoned camp!

Grantline realized it. His red helmet-light semaphored the command to follow him. His platform soared away, heading for the camp, with the other two behind him.

Anita lifted us to follow. But I checked her.

"No! Off to the right, across the valley."

"But Gregg!"

"Do as I say, Anita."

She swung us diagonally away from both the camp and the brigand ship. I prayed that we might not be noticed by the brigands.

"Anita, listen: I've an idea!"

The attack on the brigand ship was over. It lay enveloped in the darkness of the powder-gas cloud and its own darkness bombs. But it was uninjured.

Miko had answered us with our own tactics. He had practically unmanned the ship, no doubt, and had sent his men to our buildings. The fight had shifted. But I was now without ammunition, save for two or three small bullet projectors.

Of what use for our platform to rush back? Miko expected that. His attack on the camp was undoubtedly made just for that purpose.

"Anita, if we can get down on the rocks somewhere near the ship, and creep up on it unobserved in that blackness...."

I might be able to open its manual hull-lock, rip it open and let the air out. If I could get into its pressure chamber and unseal the inner slide....

"It would wreck the ship, Anita, exhaust all its air. Shall we try it?"

"Whatever you say, Gregg."

We seemed to be unobserved. We skimmed close to the valley floor, a mile from the ship. We headed slowly toward it, sailing low over the rocks.

Then we landed, left the platform.

"Let me go first, Anita."

I held a bullet projector. With slow, cautious leaps, we advanced. Anita was behind me. I had wanted to leave her with the platform, but she would not stay. And to be with me seemed at least equally safe.

The rocks were deserted. I thought there was very little chance that any of the enemy would lurk here. We clambered over the pitted, scarred surface. The higher crags, etched with Earthlight, stood like sentinels in the gloom.

The brigand ship with its surrounding darkness was not far from us. Then we entered the cloud.

No one was out here. We passed the wreckage of broken projectors, and gruesome, shattered human forms.

We prowled closer. The hull of the ship loomed ahead of us. All dark.

We came at last close against the sleek metal hull-side, slid along it toward where I was sure the manual-porte was located.

Abruptly I realized that Anita was not behind me! Then I saw her at a little distance, struggling in the grip of a giant helmeted figure! The brigand lifted her—turned, and, carrying her, ran the other way!

I did not dare fire. I bounded after them along the hull-side, around under the curve of the pointed bow, down along the other side.

I had mistaken the hull-porte location. It was here.

The running, bounding figure reached it, slid the panel. I was only fifty feet away—not much more than a single leap. I saw Anita being shoved into the pressure lock. The Martian flung himself after her.

I fired at him, but missed. I came with a rush. And as I reached the porte it slid closed in my face, barring me!

Chapter 37 In the Pressure Lock.

With puny fists I pounded the panel. A small pane in it was transparent. Within the lock I could see the blurred figures of Anita and her captor—and, it seemed, another figure. The lock was some ten feet square, with a low ceiling. It glowed with a dim tube-light.

I pounded, thumped with futile, silent blows. The mechanism was here to open this manual; but it was now clasped from within and would not operate.

A few seconds only, while I stood there in a panic of confusion, raging to get in. This disaster had come so

suddenly! I did not plan; I had no thought save to batter my way in and rescue Anita. I recall that I beat on the glassite pane with my bullet projector until the weapon was bent and useless; and I flung it with a wild, despairing rage at my feet.

They were letting the ship's air-pressure into this lock. Soon they would open the inner panel, step into the secondary chamber—and in a moment more would be within the ship's hull corridor. Anita, lost to me!

The outer panel suddenly opened! I had lunged against it with my shoulder; the giant figure inside slid it. I was taken by surprise! I half-fell inward.

Huge arms went around me. The goggled face of the helmet peered into mine.

"So it is you, Haljan! I thought I recognized that little device over your helmet-bracket. And there is my little Anita, come back to me again!"

Miko!

This was he. His great bloated arms encircling me, bending me backward, holding me almost helpless. I saw over his shoulder that Anita was clutched in the grip of another helmeted figure. No giant, but tall for an Earthman—almost as tall as myself. Then the tubelight in the room illumined the visor. I saw the face, recognized it. Moa!

I gasped, "So—I've—got you, Miko—"

"Got me! You're a fool to the last, Gregg Haljan! A fool to the last! But you were always a fool."

I could scarcely move in his grip. My arms were pinned. As he slowly bent me backward, I wound my legs around one of his; it was as unyielding as a steel pillar. He had closed the outer panel; the air-pressure in the lock was rising. I could feel it against my suit.

My helmeted head was being forced backward; Miko's left arm held me. In his gloved right hand as it came slowly up over my throat I saw a knife-blade, its naked, sharpened metal glistening blue-white in the light from overhead.

I seized his wrist. But my puny strength could not hold him. The knife, against all my efforts, came slowly down.

A moment of this slow deadly combat—the end of everything for me.

I was aware of the helmeted figure of Moa casting off Anita—and then the two girls leaping together upon Miko. It threw him off his balance, and my hanging weight made him topple forward. He took a step to recover himself; his hand with the knife was flung up with an instinctive, involuntary balancing gesture. And as it came swiftly down again, I forced the knife-blade to graze his throat. Its point caught in the fabric of his suit.

His startled oath jangled in my ears. The girls were clawing at him; we were all four scrambling, swaying. With despairing strength I twisted at his waist. The knife went into his throat. I plunged it deeper.

His suit went flabby. He crumpled over me and fell, knocking me to the floor. His voice, with the horrible

gurgling rasp of death in it, rattled my ear-grids.

"Not such a fool—are you, Haljan—"

Moa's helmeted head was close over us. I saw that she had seized the knife, jerked it from her brother's throat. She leaped backward, waving it.

I twisted from under Miko's inert, lifeless body. As I got to my feet, Anita flung herself to shield me. Moa was across the lock, backed up against its wall. The knife in her hand went up. She stood for the briefest instant regarding Anita and me holding each other. I thought that she was about to leap upon us; but before I could move, the knife came down and plunged into her breast. She fell forward, her grotesque helmet striking the floor-grid almost at my feet.

"Gregg!"

"She's dead."

"No! She moved! Get her helmet off! There's enough

air here."

My helmet pressure-indicator was faintly buzzing to show that a safe pressure was in the room. I shut off Moa's Erentz motors, unfastened her helmet, raised it off. We gently turned her body. She lay with closed eyes, her pallid face blue-cast from the light in the lock.

With our own helmets off, we knelt over her.

"Oh. Gregg, is she dead?"

"No. Not quite—but dying."

"Oh Gregg, I don't want her to die! She was trying to help you there at the last."

She opened her eyes; the film of death was glazing them. But she saw me, recognized me.

"Gregg—"

"Yes, Moa, I'm here."

Her livid lips were faintly drawn in a smile. "I'm—so glad—you took the helmets off, Gregg. I'm—going—you know."

"No!"

"Going—back to Mars—to rest with the fire-makers—where I came from. I was thinking—maybe you would kiss me, Gregg—?"

Anita gently pushed me down. I pressed the white, faintly smiling lips with mine. She sighed, and it ended with a rattle in her throat.

"Thank you—Gregg—closer—I can't talk so loudly—"

One of her gloved hands struggled to touch me, but she had no strength and it fell back. Her words were the faintest of whispers:

"There was no use living—without your love. But I want you to see—now—that a Martian girl can—die with a smile—"

Her eyelids fluttered down: it seemed that she sighed and then was not breathing. But on her livid face the faint smile still lingered to show me how a Martian girl could die.

We had forgotten for the moment where we were. As I glanced up I saw that through the inner panel, past the secondary lock, the ship's hull-corridor was visible, and along its length a group of Martians were advancing! They saw us, and came running.

"Anita! Look! We've got to get out of here!"

The secondary lock was open to the corridor. We jammed on our helmets. The unhelmeted brigands by then were fumbling at the inner panel. I pulled at the lever of the outer panel. The brigands were hurrying, thinking they could be in time to stop me. One of the more cautious fumbled with a helmet.

"Anita, run! Try and keep your feet."

I slid the outer panel and pushed at Anita. Simultaneously the brigands opened the inner porte.

The air came with a tempestuous rush. A blast through the inner porte—through the little pressure-lock—a wild rush out to the airless Moon. All the air in the ship madly rushing to escape....

Like feathers we were blown with it. I recall an impression of the hurtling brigand figures and swift-flying rocks under me. A silent crash as I struck.

IMAGEDescription

Then soundless, empty blackness.

Chapter 38 Triumph!

"Is he conscious? We'd better take him back, get his helmet off."

"It's over. We can get back now. Venza, dear, we've won—it's over."

"He hears us!"

"Gregg!"

"He hears us—he's all right!"

I opened my eyes. I lay on the rocks. Over my helmet other helmets were peering, and faint, familiar voices mingled with the roaring in my ears.

"—back to the camp and get his helmet off."

"Are his motors smooth? Keep them right, Snap—he must have good air."

I seemed unhurt. But Anita....

She was here. "Gregg, dear one!"

Anita safe! All four of us here on the Earthlit rocks, close outside the brigand ship.

"Anita!"

She held me, lifted me. I was uninjured. I could stand; I staggered up and stood swaying. The brigand ship, a hundred feet away, loomed dark and silent, a lifeless bulk, already empty of air, drained in that mad blast outward. Like the wreck of the *Planetara*—a dead, pulseless hulk already.

We four stood together, triumphant. The battle was over. The brigands were worsted, almost the last man of them dead or dying. No more than ten or fifteen had been available for that final assault upon the camp buildings. Miko's last strategy. I think perhaps he had intended, with his few remaining men, to take the ship and make away, deserting his fellows.

All on the ship, caught unhelmeted by the explosion, were dead long since.

I stood listening to Snap's triumphant account. It had not been difficult for the flying platforms to hunt down the attacking brigands on the open rocks. We had only lost one more platform.

Human hearts beat sometimes with very selfish emotions. It was a triumphant ending for us, and we hardly gave a thought that half of Grantline's little group had perished.

We huddled on Snap's platform. It rose, lurching drunkenly, barely carrying us.

And as we headed for the Grantline buildings, where still the rift in the wall had not quite broken, there came the final triumph. Miko had been aware of it, and knew he had lost. Grantline's search-light leaped upward, swept the sky, caught its sought-for object—a huge silver cylinder, bathed brightly in the white search-beam glare.

The police-ship from Earth!

Chapter 39 My Exit

My narrative lies now in this permanently recorded form before you, and I prepare my exit bow with the humble hope that I may have given you pleasure. If so, I do beg you to tell me of it. There are some who already have flashed their approval of my discs; I thank them most earnestly and gratefully.

My errors of recording unquestionably are many; and for them I ask your indulgence. There have been, I can readily see, errors of omission. I have not mentioned, for instance, the final rescue of the *Planetara's* marooned passengers on the asteroid. You will bear with me, since the disc-space has its technical limitations, that such omissions have been unavoidable.

Since the passage of the Earth-law by the Federated Board of Education, forcing narrative fiction to cling so closely to sworn facts of actual happening, I need offer no assurance of the truth of my narrative. My witnesses have filed their corroborating declarations. Indeed, the *Planetara's* wreck and the brigands'

attack upon the Moon-treasure were given the widest news-casters' publicity, as you all know. Yet I, who was unwittingly involved in those stirring events, may have added a more personal note, making the scenes more vivid to your imagination. I have tried to do that. I do hope that in some measure you will think I have succeeded.

There are many foolish girls now who say that they would like to know Gregg Haljan. They doubtless would be very disappointed. I really crave no more publicity. And the girls of all the Universe have no charm for me. There is only one, for me—an Earth-girl.

I think that life has very beautifully endowed me with its blessings.

#17 The Soul Master, by Will Smith and R. J. Robbins:

Desperately O'Hara plunged into Prof. Kell's mysterious mansion. For his friend Skip was the victim of the eccentric scientist's deastralizing experiment, and faced a fate more hideous than death.

Aproximate word count: 15,600

Bigotry:

Warnings:

- - -

The train was slowing down for Keegan. A whistle from the locomotive ahead had warned the two alert young men in the smoker to that effect, and they arose to leave the train. Both were neatly and quietly dressed. One carried a medium-sized camera with the necessary tripod and accessory satchel. The other carried no impediments of any sort. Both were

smoking cigars, evidently not of expensive variety, judging by the unaromatic atmosphere thereabouts.

“Can’t see what Bland shipped us up to this one-horse dump for,” grumbled Skip Handlon, the one who carried the camera. He was the slighter of the two and perhaps half a head shorter than the other. “Do you know anything about it?”

“Not much,” confessed the other as they alighted from the smoker. “All I can tell you is that Bland sent for me early this morning, told me to get a story out of this Professor Kell and to drag you along. After we get there you are to do as judgment dictates. But I remember that the Chief was specific as regards one thing. You are to get the proff’s mug. Don’t forget. The old fellow may growl and show fight, but it’s up to you to deliver the goods--or, in this case, get them. Don’t depend on me for help. I expect to have troubles of my own.” Thus gloomed Horace Perry, star reporter for the Journal.

“This Keegan place”--Handlon was using his eyes swiftly and comprehensively--“isn’t worth much.

Can't see how it manages to even rate a name. Some dump, all right!"

"You said a couple mouthfuls."

"How's the train service, if any?"

"Rotten. Two trains a day." The other was anything but enthusiastic. "We've a nice long wait for the next one, you can bet. Now, just add to that a rough reception after we reach the old lion's lair and you get a nice idea of what Bland expects from his men."

Handlon made a wry face at this. "The bird who first applied the words 'Hard Boiled' to the Chief's monniker knew something."

"You don't know the half of it," retorted Perry encouragingly. "Just wait and see what a beaut of a fit he can throw for *your* benefit if you fail to do your stuff--and I don't mean maybe."

Old Man Bland owned the Journal, hired and fired his crew and did his own editing, with the help of as

capable an office gang as could be gotten together. It is quite possible that “Hard Boiled” Bland demanded more from his men than any other editor ever has before or since. Nevertheless he got results, and none of his experienced underlings ever kicked, for the pay was right. If a hapless scribe had the temerity to enter the editorial sanctum with a negative report, the almost invariable reply had been a glare and a peremptory order, “Get the copy.”

And get it they did. If a person refused an interview these clever fellows generally succeeded in getting their information from the next most reliable source, and it arrived in print just the same.

Of such a breed was Perry. Handlon, being a more recent acquisition to the staff, was not yet especially aggressive in his work. On this account the former took keen zest in scaring him into displaying a bit more sand.

The train had disappeared around a bend and the two reporters felt themselves marooned. Keegan, without question, was a most forlorn looking spot. A dismal

shanty, much the worse for weather, stood beside the track. In front, a few rotting planks proclaimed that once upon a time the place had boasted a real freight platform. Probably, back in some long-forgotten age, a station agent had also held forth in the rickety shanty. A sign hung on each end of the crumbling structure on which could still be deciphered the legend "KEEGAN." On the opposite side of the track was an old, disused siding. The only other feature of interest thereabouts was a well traveled country road which crossed the tracks near the shanty, wound sinuously over a rock-strewn hill and became lost in the mazes of an upland forest.

There being no signboard of any kind to indicate their destination, the two, after a moment's hesitation, started off briskly in a chance direction. The air was hot and sultry, and in the open spaces the sun beat down mercilessly upon the two hapless ones. As they proceeded into the depths of the forest they were shielded somewhat from the worst of the heat. Gradually upon their city-bred nostrils there stole the odor of conifers, accompanied by a myriad of other

forest odors. Both sniffed the air appreciatively.

“This is sure the life,” remarked Perry. “If I weren’t so darn thirsty now....” He became lost in mournful thought.

A considerable time passed. The newspaper men trudged wearily along until finally another bend brought them to the beginning of a steep descent. The forest had thinned out to nothing.

“Seems to me I smell smoke,” blurted out Handlon suddenly. “Must be that we are approaching the old party’s lair. Remember? Bland said that he--”

“Uh huh!” the other grunted, almost inaudibly. Now that they seemed to be arriving at their destination something had occurred to him. He had fished from his pocket a sheaf of clippings and was perusing them intently. “Bland said, ‘Get the copy’,” he muttered irrelevantly and half to himself.

The clippings all related directly to Professor Kell or to happenings local to Keegan. Some were of peculiar

interest. The first one was headlined thus:

Mysterious Disappearance Of Robert Manion And Daughter Still Unsolved

The piece contained a description of the missing man, a fairly prosperous banker who had been seen four days previously driving through Keegan in a small roadster, and one of the girl, who was in the car with him. It told that the banker and his daughter were last seen by a farmer named Willetts who lived in a shack on the East Keegan road, fleeing before a bad thunder storm. He believed the pair were trying to make the Kell mansion ahead of the rain. Nothing more of the Manions or their car had been seen, and their personal effects remained at their hotel in a nearby village unclaimed. The heavy rain had of course effectually obliterated all wheel tracks.

Another clipping was fairly lengthy, but Perry glanced only at the headlines:

“Kell Still Carrying On His Strange Experiments

Has Long Been Known to Have Fantastic Theories.
Refuses to Divulge Exact Methods Employed, or
Nature of Results”

Still another appeared to be an excerpt from an article in an agricultural paper. It read:

“A prize bull belonging to Alton Shepard, a Keegan cattle breeder, has created considerable sensation by running amuck in a most peculiar manner. While seemingly more intelligent than heretofore, it has developed characteristics known to be utterly alien to this type of animal.

Perhaps the most noteworthy feature of the case is the refusal of the animal to eat its accustomed food. Instead it now consumes enormous quantities of meat. The terrific bellow of the animal’s voice has also undergone a marked change, now resembling nothing earthly, although some have remarked that it could be likened to the bay of an enormous hound. Some of its later actions have seemingly added further canine attributes, which make the matter all the more

mystifying. Veterinaries are asking why this animal should chase automobiles, and why it should carry bones in its mouth and try to bury them!”

The last one read in part:

“Professor Kell has been questioned by authorities at Keegan relative to the disappearance there last Tuesday of Robert Manion and his daughter. Kell seemed unable to furnish clues of any value, but officials are not entirely satisfied with the man’s attitude toward the questions.”

Somewhat bewildered by these apparently unrelated items, the reporter remained lost in thought for quite a space, the while he endeavored to map out his course of action when he should meet the redoubtable Professor. That many of the weird occurrences could be traced in some way to the latter’s door had evidently occurred to Bland. Furthermore, the Old Man relied implicitly upon Perry to get results.

It must be said that for once the star reporter was not overly enthusiastic with the assignment. Certain

rumors aside from the clippings in his hand had produced in his mind a feeling of uneasiness. So far as his personal preference was concerned he would have been well satisfied if some cub reporter had been given the job. Try as he would, however, he could offer no tangible reason for the sudden wariness.

He was aroused from his absorption by his companion.

“Thought I smelled smoke a while back, and I was right. That’s the house up in the edge of the pines. Deep grounds in front and all gone to seed; fits the description exactly. Thank Heaven we struck off from the station in the right direction. This stroll has been long enough. Come out of it and let’s get this job finished.”

Suiting the action to the words Handlon started off at a brisk pace down the hill, followed at a more moderate rate by Perry. At length they came within full sight of the grounds. Extending for a considerable distance before them and enclosing a large tract of

land now well covered with lush grass, was a formidable looking wall. In former days a glorious mantle of ivy had covered the rough stones; but now there was little left, and what there was looked pitifully decrepit. They continued their progress along this barrier, finally coming upon a huge iron gate now much the worse for rust. It stood wide open.

The road up to the house had long since become overgrown with rank grass and weeds. Faintly traceable through the mass of green could be seen a rough footpath which the two followed carefully. They met no one. As they approached the night of black pines the mass of the old mansion began to loom up before them, grim and forbidding.

Instinctively both shivered. The silence of the place was complete and of an uncannily tangible quality. Nervously they looked about them.

“How do you like it, Skip?” The words from Perry’s previously silent lips broke upon the stillness like a thunderclap. The other started.

“I should hate to die in it,” Handlon answered solemnly. “I’ll bet the old joint is haunted. Nobody but a lunatic would ever live in it.”

“I get a good deal the same impression myself,” said Perry. “I don’t wonder that Bland sent two of us to cover the job.”

As he spoke he mounted a flight of steps to a tumbledown veranda. There was no sign of a door bell on the weather-beaten portal, but an ancient knocker of bronze hanging forlornly before him seemed to suggest a means of attracting attention. He raised it and rapped smartly.

No answer.

Possessing all the attributes of the conventional reporter and a few additional ones, Perry did not allow himself to become disheartened, but merely repeated his summons, this time with more vim.

“Well, Horace,” grinned Handlon, “it does look as if we were not so very welcome here. However, seems

to me if you were to pick up that piece of dead limb and do some real knocking with it.... The dear Professor may be deaf, you know, or maybe he's--"

"Skip, my boy, I don't know as we ought to go in right now after all. Do you realize it will soon be dark?"

"To tell you the truth, Horace, I'm not stuck on this assignment either. And I feel that after dark I should like it even less, somehow. But, gee, the Old Man...."

"Oh, I'm not thinking of quitting on the job. We don't do that on the Journal." Perry smiled paternally at the photographer. Could it be he had purposely raised the other's hopes in order to chaff him some more? "But I was thinking that it might be a good idea to look about the outbuildings a bit while we have a little daylight. Eh?"

Handlon looked disappointed, but nodded gamely. He delayed only long enough to deposit his camera and traps behind a grossly overgrown hydrangea by the steps, then, with a resigned air, declared himself ready to follow wherever the other might lead.

Perry elected to explore the barn first. This was a depressing old pile, unpainted in years, with what had once been stout doors now swinging and bumping in the light breeze. As the two men drew nearer, this breeze--which seemed to sigh through the place at will--brought foul odors that told them the place was at least not tenantless. In some trepidation they stepped inside and stood blinking in the half darkness.

“Pretty Polly!”

“Good God! What was that?” Handlon whispered. He knew it was no parrot’s voice. This was a far deeper sound than that, a sound louder than anything a parrot’s throat could produce. It came from the direction of a ruinous stall over near a cobwebbed window. As Perry started fearfully toward this, there issued from it a curious scraping sound, followed by a fall that shook the floor, and a threshing as of hoofs. Now the great voice could be heard again, this time uttering what sounded strangely like oaths roared out in a foreign tongue. Yet when the newspaper men reached the stall they found it occupied only by a

large mule.

The animal was lying on its side, its feet scraping feebly against the side of the stall. The heaving, foam-flecked body was a mass of hideous bruises, some of which were bleeding profusely. The creature seemed to be in the last stage of exhaustion, lying with lips drawn back and eyes closed. Beneath it and scattered all over the stall floor was a thick layer of some whitish seeds.

“That’s--why that’s sunflower seed, Horace!” Handlon almost whimpered. “And look! Look in that crib! It’s full of the same stuff! Where’s the hay, Horace? Does this thing--”

He was interrupted by a mighty movement of the beast--a threshing that nearly blinded the men in the cloud of bloodstained seeds it raised. With something between a curse and a sob, the mule lunged at its crib as if attempting to get bodily into it. But no: it was only trying to perch on its edge! Now it had succeeded. The ungainly beast hung there a second, two, three. From its uplifted throat issued that usually

innocuous phrase, a phrase now a thing of delirious horror:

“Pretty Polly!”

With a crash the tortured creature fell to the floor, to lie there gasping and moaning.

Skip Handlon left that barn. Perry retained just enough wit to do what he should have done the instant he first saw the animal. He whipped out his automatic and fired one merciful shot. Then he too started for the outside. He arrived in the yard perhaps ten seconds behind Handlon.

“Good Heavens, Perry,” gibbered Handlon. “I’m not going to stay around this place another minute. Just let me find where I left that suffering camera, that’s all I ask.”

“Easy now.” Perry laid a hand on his companion’s shoulder. “I guess we’re up against something pretty fierce here, but we’re going to see it through, and you know it. So let’s cut out the flight talk and go raise

the Professor.”

Handlon tried earnestly to don a look of determination. If Perry was set on staying here the least he could do was stay with him. However, could Perry have foreseen the events which were to entangle them, he probably would have led the race to the gate. As it was, he grasped a stick and marched bravely up toward the front door.

A sudden commotion behind him caused him to wheel sharply around. Simultaneously a yell burst from Handlon.

“Look out, Horace!”

What he saw almost froze the blood in his veins. From a tumbledown coach house had issued an enormous wolf-hound which was now almost upon them, eyes flaming, fangs gleaming horribly.

So unexpected was the attack that both men stood rooted in their tracks. The next moment the charging brute was upon them, and had bowled Handlon off his

equilibrium as if he were a child. The unfortunate photographer made a desperate attempt to prevent injury to his precious camera, which he had but a moment earlier succeeded in retrieving, and in doing so fell rather violently to the ground. Every moment he expected to feel the powerful jaws crunch his throat, and he made no effort to rise. For several seconds he remained thus, until he could endure the suspense no longer. He glanced around only to see Perry, staring open-mouthed at the animal which had so frightened them. Apparently it had forgotten the presence of the two men.

Handlon regained his feet rather awkwardly, the while keeping a watchful eye on the beast, of whose uncertain temper he was by now fully aware. In an undertone he addressed his companion.

“What do you make of it?” he wanted to know. “Did the critter bite you?”

“No. That’s the queer part of it. Neither did he bite you, if you were to think it over a minute. Just put his nose down and *rammed* you, head on.”

The photographer was flabbergasted. Involuntarily his gaze stole again in the direction of the offending brute.

“What on earth--” he began. “Is he sharpening his teeth on a rock preparatory to another attack upon us? Or--What the deuce *is* he doing?”

“If you ask me,” came astonishingly from the watchful Perry, “he’s eating grass, which is my idea of something damn foolish for a perfectly normal hound, genus lupo, to be--Look out!”

The animal, as if suddenly remembering the presence of the men, suddenly charged at them again, head down, eyes blazing. As before, it made no effort to bite. Though both men were somewhat disconcerted by the great brute they held their ground, and when it presented the opportunity the older reporter planted a terrific kick to the flank which sent the animal whimpering back to its shed behind.

“Score one,” breathed Handlon. “If we--” At a sudden grating sound overhead, he stopped.

Both turned to face the threatening muzzle of an ancient blunderbuss. Behind it was an irate countenance, nearly covered by an unclipped beard of a dirty gray color. In the eyes now glaring at them malevolently through heavily concaved spectacles they read hate unutterable. The barrel of the blunderbuss swung slightly as it covered alternately one and the other. Both sensed that the finger even now tightening on the trigger would not hesitate unduly. Being more or less hardened to rebuffs of all kinds in the pursuance of their calling, the reporters did not hesitate in stating their purpose.

“What?” yelled the old man. “You dare to invade my grounds and disturb me at my labors for such a reason? Reporters! My scientific research work is not for publicity, sirs; and futhermore I want it understood that I am not to be dragged from my laboratory again for the purpose of entertaining you or any others of your ilk. Get away!”

Without further ado the window was slammed down, a shutter closed on the inside, and once more the silence of the dead descended upon the spot. The two

men grinned ruefully at each other, Handlon finally breaking the stillness.

“My idea of the world’s original one-sided conversation. We simply didn’t talk--and yet we’re supposed to be reporters. You’ve got to hand it to the Proff, Horace, for the beautiful rock-crusher he just handed us.”

“You didn’t think we had anything easy, did you?” said Perry irritably. “He’ll change his tune presently, when--”

Handlon’s jaw dropped. “You don’t mean you’re going to take any more chances! Would you rouse him again after the way he treated us with that gun? Besides, the train....”

Perry bent a scathing glance at his companion. “What on earth has the train to do with our getting the Professor’s confession of crime or whatever he has to offer? You evidently don’t know Bland--much. I deduce that a lot of my sweetness has been wasted on the desert air. Once more, let me assure you that if

you propose to go back without the Proff's mug on one of those plates you might as well mail your resignation from *here*. Get me?"

The other wilted.

"I wonder," Perry ruminated as he stared in the direction of the shed wherein the canine monstrosity had disappeared. "Do you suppose that you can get a snap of the old boy's mug if I can get him to the window again? If you can do that, just leave the rest to me. I've handled these crusty birds before. What say?"

"Go as far as you like." The photographer was once more grinning as he unslung his camera and carefully adjusted a plate in place. Everything at last to his satisfaction he gripped flash pan and bulb.

"I'm going to make some racket now," announced Perry grimly. "If Kell shows up, work fast. He may shoot at you, but don't get excited. It's almost dark, so his aim *might* be poor."

At this suggestion his companion showed signs of panic, but the other affected not to notice this. There came a deafening hullabaloo as Perry beat a terrific tattoo on the ancient door. Followed a deep silence, while Perry leaped back to stand in front of Skip and his camera. After perhaps a full minute's wait he once more opened up his bombardment, to jump quickly back to the camera as before. This time he had better success. The window was again opened and the muzzle of the blunderbuss put in its appearance. Handlon stood close behind Perry as he silently swung the camera into a more favorable position for action. The face at the window was purple with wrath.

“You damned pests! Leave my grounds at once or I shall call my hound and set him upon you. And when--”

Crack! Flash! Click! Perry had made a sudden sidewise movement as Handlon went into action.

“Much obliged, Professor,” said Perry politely. “Your pose with that old cannon is going to be very effective from the front page. The write-up will doubtless be

interesting too. Probably the story won't be quite so accurate as it would be had you told it to us yourself; but we shall get as many of the details from the natives hereabouts as we can. Good-day to you, sir!"

Motioning to the other he turned on his heel and started down the driveway. It was an old trick, and for a long moment of suspense he almost feared that it would fail. Another moment--

"Wait!" The quavering voice of the irascible old villain had lost some of its malice. "Come back here a minute."

With simulated reluctance the two slowly retraced their steps. "Is there something else, sir?"

"Perhaps...." The old man hesitated, as if pondering upon his words. "Perhaps if you care to step in I can be of assistance to you after all. It occurs to me that possibly I have been too abrupt with you."

"I am very glad that you have decided to cooperate with us, Professor Kell," answered the reporter

heartily, as they ascended the steps. The old man's head disappeared from the window and shortly the sound of footsteps inside told of his approach. Finally the oaken door swung open, and they were silently ushered into the musty smelling hallway. Though outwardly accepting the Professor's suddenly pacific attitude, Perry made up his mind to be on his guard.

As they entered what had evidently been the parlor in bygone days, an oppressive, heavy odor smote their nostrils, telling of age-old carpets and of draperies allowed to decay unnoticed. On the walls hung several antique prints, a poorly executed crayon portrait of a person doubtless an ancestor of the present Kell, and one or two paintings done in oil, now badly cracked and stained. Everything gave the impression of an era long since departed, and the two men felt vaguely out of place. Their host led them to a pair of dilapidated chairs, which they accepted gratefully. The ride to Keegan after a hard day's work had not tended to improve their spirits.

"Now to business." Perry went straight to the point, desiring to get the interview over as soon as possible.

“We have heard indirectly of various happenings in this vicinity which many think have some connection with your scientific experiments. Any statement you may care to make to us in regard to these happenings will be greatly appreciated by my paper. Inasmuch as what little has already been printed is probably of an erroneous nature, we believe it will be in your own best interest to give us as complete data as possible.” Here he became slightly histrionic. “Of course we do not allow ourselves to take the stories told by the local inhabitants too literally, as such persons are too liable to exaggerate, but we must assume that some of these stories have partial basis in fact. Any information relative to your scientific work, incidentally, will make good copy for us also.”

Perry gazed steadily at the patriarch as he spoke. For a moment, a crafty expression passed over the old man’s face, but as suddenly it disappeared. Evidently he had arrived at a decision.

“Come with me,” he wheezed.

The two newspaper men exchanged swift glances, the

same thought in the mind of each. Were they about to be led into a trap? If the old man's shady reputation was at all deserved they would do well to be wary. Perry thought swiftly of the clippings he had read and of what gossip he had heard, then glanced once more in the direction of Handlon. That worthy was smiling meaningly and had already arisen to follow the Professor. Reluctantly Perry got to his feet and the three proceeded to climb a rickety stairway to the third floor. The guide turned at the head of the stairs and entered a long dark corridor. Here the floor was covered with a thick carpet which, as they trod upon it, gave forth not the slightest sound.

The hall gave upon several rooms, all dark and gloomy and giving the same dismal impression of long disuse. How could the savant endure such a depressing abode! The accumulation of dust and cobwebs in these long forgotten chambers, the general evidence of decay--all told of possible horrors ahead. They became wary.

But they were not wary enough!

The uncouth figure ahead of them had stopped and was fumbling with the lock of an ancient door.

Instinctively Perry noted that it was of great thickness and of heavy oak. Now the Professor had it open and was motioning for them to enter. Handlon started forward eagerly, but hurriedly drew back as he felt the grip of the other reporter's hand on his arm.

"Get back, you fool!" The words were hissed into the ear of the incautious one. Then, to the Professor, Perry observed: "If you have no objection we would prefer that you precede us."

A look of insane fury leaped to the face of the old man, lingered but an instant and was gone. Though the expression was but momentary, both men had seen, and seeing had realized their danger.

They followed him into the chamber, which was soon illumined fitfully by a smoky kerosene lamp. Both took a rapid survey of the place. Conceivably it might have been the scene of scientific experiments, but its aspect surely belied such a supposition. The average imagination would instantly pronounce it the abode of

a maniac, or the lair of an alchemist. Again, that it might be the laboratory of an extremely slovenly veterinary was suggested by the several filthy cages to be seen resting against the wall. All of these were unoccupied except one in a dark corner, from which issued a sound of contented purring, evidently telling of some well-satisfied cat.

The air was close and foul, being heavy with the odor of musty, decaying drugs. In every possible niche and cranny the omnipresent dust had settled in a uniform sheen of gray which showed but few signs of recent disturbance.

“Here, gentlemen,” their host was saying, “is where I carry on my work. It is rather gloomy here after dark, but then I do not spend much time here during the night. I have decided to acquaint you with some of the details of one or two of my experiments. Doubtless you will find them interesting.”

While speaking he had, mechanically it seemed, reached for a glass humidor in which were perhaps a dozen cigars. Silently he selected one and extended

the rest to the two visitors.

After all three had puffed for a moment at the weeds, the old man began to talk, rapidly it seemed to them. Perry from time to time took notes, as the old man proceeded, an expression of utter amazement gradually overspreading his face. Handlon pulled away contentedly at his cigar, and on his features there grew an almost ludicrous expression of well-being. Was the simple photographer so completely at ease that he had at length forsaken all thought of possible danger?

As Professor Kell talked on he seemed to warm to his subject. At the end of five minutes he began uncovering a peculiar apparatus which had rested beneath the massive old table before which they were sitting. The two men caught the flash of light on glass, and a jumble of coiled wires became visible.

Was the air in the laboratory getting unbearably close? Or was the queer leaden feeling that had taken possession of Perry's lungs but an indication of his overpowering weariness? He felt a steadily increasing

irritation, as if for some strange reason he suddenly resented the words of their host, which seemed to be pouring out in an endless stream. The cigar had, paradoxically, an oddly soothing quality, and he puffed away in silence.

Why had the room suddenly taken on so hazy an aspect? Why did Handlon grin in that idiotic manner? And the Professor ... he was getting farther and farther away ... that perfecto ... or was it an El Cabbajo? What was the old archfiend doing to him anyhow?... Why was he laughing and leering at them so horribly?... Confound it all ... that cigar ... where was it?... Just one more puff....

Blindly he groped for the missing weed, becoming aware of a cackle of amusement nearby. Professor Kell was standing near the spot where he had fallen and now began prodding him contemptuously with his toe.

“Fools!” he was saying. “You thought to interfere with my program. But you are in my power and you have no hope of escape. I am unexpectedly provided with

more subjects for my experiments. You will....” His words became hazy and unintelligible, for the hapless reporter was drifting off into a numb oblivion. He had long since lost the power to move a muscle. Out of the corner of an eye, just before he lost consciousness altogether, he perceived Handlon lying upon the floor still puffing at the fateful drugged cigar.

Eons passed.

To the reporter came a vision of a throbbing, glaring inferno, wherein he was shaken and tossed by terrific forces. His very vital essence seemed to respond to a mighty vibration. Now he was but a part of some terrific chaos. Dimly he became aware of another being with whom he must contend. Now he was in a death struggle, and to his horror he found himself being slowly but surely overpowered. A demoniac grin played upon the features of the other as he forced the reporter to his knees. It was Handlon.... Once more he was sinking into soft oblivion, the while a horrid miasma assailed his nostrils. He was nothing....

Slowly, and with infinite effort, Perry felt himself

returning to consciousness, though he had no clear conception of his surroundings. His brain was as yet but a whirling vortex of confused sounds, colors and--yes, odors. A temporary rift came in the mental cloud which fettered his faculties, and things began to take definite shape. He became aware that he was lying upon his back at some elevation from the floor. Again the cloudy incubus closed in and he knew no more.

When he finally recovered the use of his faculties it was to discover himself the possessor of a violent headache. The pain came in such fearsome throbs that it was well nigh unendurable. The lamp still sputtered dimly where the professor had left it. At the moment it was on the point of going out altogether. The reporter noticed this, and over him stole a sense of panic. What if the light should fail altogether, leaving him lying in the dark in this frightful place! Still dizzy and sick, he managed to rise upon his elbows enough to complete a survey of the room. He was still in the laboratory of Professor Kell, but that worthy had disappeared. Of Handlon there was no sign. The mysterious apparatus, of which he now had

but a vague remembrance, also had vanished.

His thoughts became confused again, and wearily he passed a hand over his brow in the effort to collect all of his faculties. The lamp began to sputter, arousing him to action. Desperately he fought against the benumbing sensation that was even again stealing over him. Gradually he gained the ascendancy. He struggled dizzily to his feet and took a few tentative steps.

Where was Handlon? He decided his friend had probably recovered from the drug first and was gone, possibly to get a doctor for him, Perry. However, he must make some search to determine if Skip had really left the premises.

As he walked through the open door the lamp in his hand gave a last despairing flicker and went out. From there he was forced to grope his way down the dark hall to the stairs. Just how he reached the lower floor he was never able to remember, for as yet all the effect of the powerful drug had not worn off. He had a dim recollection of being thankful to the ancestor of

Kell who had provided such thick carpets in these halls. Thanks to them his footsteps had been noiseless, at any rate.

What was Kell's real object in giving them those drugged cigars? he wondered. How long had they been under the influence of the lethal stuff? Surely several hours. Upon glancing through a hall window he found that outside was the blackness of midnight.

Cautiously he explored the desolate chambers on the ground floor: the kitchen--where it could be plainly seen that cooking of a sort had been done--the barn, and woodshed. Not a living thing could he find, not even the huge wolf-hound which had attacked them in so strange a manner that afternoon.

By now he was quite frankly worried on Handlon's account. At that moment, could he have known the actual fate that had overtaken his companion, it is quite probable he would have gone mad. He stumbled back and into the dark front hall, shouting his friend's name. The response was a hollow echo, and once or twice he thought he heard the ghost of a mocking

chuckle.

At length he gave up the search and started for the door, intent now only upon flight from the accursed place. He would report the whole thing to the office and let Bland do what he pleased about it. Doubtless Handlon had already left. Then he stumbled over Handlon's camera. Evidently the Professor had neglected to take possession of it. That must be rescued, at all costs. He picked it up and felt the exposed plate still inside. He started again for the door.

What little light there was faded out and he felt stealing over him a horrid sensation of weakness. Again came a period of agony during which he felt the grip of unseen forces. Once more it seemed that he was engaged in mortal strife with Skip Handlon. Malevolently Handlon glared at him as he endeavored with all his strength to overcome Perry. This time, however, the latter seemed to have more strength and resisted the attack for what must have been hours. Finally the other drew away baffled.

At this the mental incubus surrounding Perry's faculties broke. Dimly he became aware of a grinding noise nearby and a constant lurching of his body. At length his vision cleared sufficiently to enable him to discover the cause of the peculiar sensations.

He was in a railroad coach!

He took a rapid glance around and noted a drummer sitting in the seat across the aisle, staring curiously at him. With an effort Perry assumed an inscrutable expression and determined to stare the other out of countenance. Reluctantly the man glanced away, and after a moment, under Perry's stony gaze, he suddenly arose and chose a new seat in front of the car. Perry took to the solace of a cigarette and stared out at the flying telegraph poles. From time to time he noted familiar landmarks. The train had evidently left Keegan far behind and was already nearly into the home town.

For the balance of the ride the reporter experienced pure nightmare. The peculiar sensations of dizziness, accompanied by frightful periods of insensibility, kept

recurring, now, however, not lasting more than ten or fifteen minutes at a time. At such times as he was conscious he found opportunity to wonder in an abstracted sort of way how he had ever managed to get on the train and pay his fare, which must have been a cash one, without arousing the conductor's suspicions. Discovery of a rebate in his pocket proved that he must have done so, however. The business of leaving the train and getting to the office has always been an unknown chapter in Perry's life.

He came out of one of his mental fogs to find himself seated in the private editorial sanctum of the Journal. Evidently he had just arrived. Bland, a thick-set man with the jaw of a bulldog, was eyeing him intently.

"Well! Any report to make?" The question was crisp.

The reporter passed a hand across his perspiring forehead. "Yes, I guess so. I--er--that is--you see--"

"Where's Handlon? What happened to you? You act as if you were drunk." Bland was not in an amiable mood.

“Search me,” Perry managed to respond. “If Skip isn’t here old man Kell must have done for him. I came back alone.”

“You wha-a-t?” the irate editor fairly roared, half rising from his chair. “Tell me exactly what happened and get ready to go back there on the next train. Or--no, on second thoughts you’d better go to bed. You look all used up. Handlon may be dead or dying at this minute. That Kell could do anything.” He pressed the button on his desk.

“Johnny,” he said to the office boy, “get O’Hara in here on the double quick and tell him to bring along his hat and coat.”

He turned again to Perry, who was gazing nervously at the door. “Now tell me everything that happened and make it fast,” he ordered.

The reporter complied, omitting nothing except the little matter of his mental lapses at the house of Professor Kell and later on the train. The incident of the drugged cigars seemed to interest the Old Man

hugely, and Perry did not forget to play up Handlon's exploits in getting the picture of the Professor. All through the recital he was in a sweat for fear that he might have a recurrence of one of his brain spells and that Bland would become cognizant of it. When would the Chief finish and let him escape from the office? Desperately he fought to prevent the numbing sensation from overcoming him. All that kept him from finally fleeing the place in panic was the entrance of Jimmie O'Hara.

Slight, wiry and efficient looking, this individual was a specimen of the perfect Journal reporter. This is saying a good deal, for the news crew and editorial force of the paper were a carefully selected body of men indeed. Bland never hired a man unless experience had endowed him with some unusual qualification. Most of them could write up a story with realistic exactitude, being able in most cases to supply details gleaned from actual experience in one walk of life or another.

Of this redoubtable crew probably the queerest was Jimmie O'Hara. Jimmie had just finished a sentence in

the “pen” for safe-cracking at the time he landed the job with the Journal. Theoretically all men should have shunned him on account of his jailbird taint. Not so Bland. The Chief was independent in his ideas on the eternal fitness of things and allowed none of the ordinary conventions of humanity to influence his decisions. So Jimmie became one of the staff and worked hard to justify Bland in hiring him. His former profession gave him valuable sidelights upon crime stories of all kinds, and he was almost invariably picked as the man to write these up for the columns.

“Jimmie,” said the Chief, “we have need of an experienced strong-arm man and all around second story worker. You are the only man on the force who fills the bill for this job. Perry here has just returned from Keegan, where I sent him to interview Professor Kell. Skip Handlon went with him, but failed to return. We want to know what happened to Skip. That is your job. *Get Handlon!* If he is dead let me know by long distance phone and I’ll have a couple of headquarters men down there in a hurry. Get a good fast car and don’t waste any time. That’s all.”

O'Hara stopped long enough to get the location of Professor Kell's place fixed in his mind, then abruptly departed. Bland gazed after him musingly.

"The Professor will have some job to put anything over on that bird," he said grimly. "Personally, I'm sorry for the old soul."

After leaving the Journal office Jimmie proceeded directly to a certain stable where he kept his private car. It was a long, low speedster with a powerful engine, and capable of eating up distance. It was the work of a minute to touch the starter and back out of the yard.

For the next hour he held the wheel grimly while the car roared over the seventy-odd miles to Keegan. Would he be in time? At last a sign post told him that he was within five miles of the railroad crossing at Keegan. Now the headlights were picking out the black outlines of the freight shed, and the next moment he had swept over the tracks. The luminous dial on his wrist watch notified him that he had been on the road but little over an hour, but his spirits

somehow refused to revive with the knowledge.

About a mile beyond the station he drove the car into a dark wood road and parked it, turning off all lights. The rest of the way to the Professor's mansion he did on foot. Rather than approach from the front of the grounds he nimbly climbed a stone wall and, crossing a field or two, entered the stretch of woods which extended just behind the mansion. His pocket flashlight here came into use, and once or twice he gave a reassuring pat to a rear pocket where bulged a heavy Colt automatic.

What was that? He had approached very close to the rear of the house now. No lights were visible as yet, but unless he was greatly mistaken he had heard a muffled scream. He stopped in his tracks and listened intently. Again it came, this time with a blood-curdling cadence ending in what he would have sworn was a choking sob.

The little job of getting the old-fashioned rear window open was a mere nothing to the experienced O'Hara, and in a moment he was inside the house. His feet

struck soft carpet. Catlike, he stepped to one side in order to prevent any hidden eyes from perceiving his form silhouetted in the dim light of the open window. He dared not use his flashlight for fear that the circle of light would betray his position, thus making him an excellent target for possible bullets. Following the wall closely he managed to circle the room without mishap. His searching fingers finally came in contact with a door frame, and he breathed a sigh of relief. Here there was nothing to bar his progress except some moth-eaten portieres. These he brushed aside.

The room which he now entered was probably the same into which the Professor had ushered Handlon and Perry the day before. There being still no sign of life about, the reporter decided to throw caution to the winds. He brought his flash into play. Quickly casting the powerful beam around the chamber he examined the place with an all-searching glance.

Nothing.

With a stifled oath he turned his attention to the other rooms in the immediate vicinity. The brilliant light

revealed not the slightest trace of a person, living or dead. The sound must have come from the second story or from the cellar. He decided on the upper floor.

Feverish with impatience because of the valuable time he had already lost, he bounded up the heavily carpeted stairs two at a time. Now to his keen ears came certain faint sounds which told him that he was on the right track. Before him extended a long, dusty hall, terminating in a single heavy door. Several other doors opened at intervals along the corridor. One or two of these were open, and he threw the beam from his flash hastily into one after another of them. He saw only dusty and mildewed chamber furnishings of an ancient massive style.

Suddenly he pricked up his ears.

The door ahead of him was creaking slowly open. Instantly he extinguished his torch and leaped into the nearest room. Whoever was opening that end door was carrying a lamp. What if the Professor had accomplices who might discover him and overpower

him by force of numbers! O'Hara drew the automatic from his pocket, deriving a comforting assurance from the feel of the cold steel. Here was something no man could resist could he but get it into action. The light was now nearly abreast of his door, and for a sickening instant he thought the prowler was coming into the room. He held his breath. Now the lamp was at the open door, and now it was quickly withdrawn. After a breathless second he tip-toed forward and peered cautiously down the hallway.

About here it was that James O'Hara began to realize that this was going to be a horrible night indeed. He had wondered why the progress of the light had been so deathly slow. Now he knew why, by reason of what he saw--and what he saw made him feel rather sick. The man with the lantern was quite plainly Professor Kell, bent nearly double with the weight of a grotesquely big thing on his back, a thing that flung a dim, contorted shadow on the ceiling. And that thing was a dead man.

A corpse it was--the attitude proved that. With a numb relief O'Hara realized it was not the body of

Skip Handlon. This had been a much larger man than Skip, and the clothing was different from anything Handlon had worn.

The light was now disappearing down the stairway. For a moment O'Hara felt undecided as to his next move. Should he follow Kell and his burden, or should he not take advantage of this fine opportunity to continue his search of the upper story? That scream still rang in his ears; there had been a very evident feminine quality in it, and the remembrance of that fact reproached him. Had he been guilty of mincing daintily about in this old house while a woman was being done to death under his nose, when a little bolder action on his part might have saved her?

Stepping once more into the hall he advanced to the door just closed behind the Professor and tried it, only to find it locked. Out of a pocket came several articles best known to the "profession"--a piece of stiff wire, a skeleton key and other paraphernalia calculated to reduce the obstinate mechanism to submission. For a minute, two, three, he worked at the ancient lock; then, without a creak, the door

swung open. A touch of oil to the hinges had insured their silence. Jimmie O'Hara believed in being artistic in his work, especially when it came to fine points, and he was.

He found himself in the same room where the drugged cigars had been proved the undoing of Handlon and Perry. In order not to alarm the Professor unduly by chance noises and perhaps invite a surprise attack upon himself, O'Hara closed the laboratory door behind him and let the lock spring again. Hastily he made search of the place. No trace of the missing reporter could he find, except two half-consumed cigars in a corner whence the Professor had impatiently kicked them.

On the big table in the center of the room, however, was an object which excited his interest. It was apparently nothing more or less than a giant Crookes tube, connected in some way with a complicated mechanism contained in a wooden cabinet under the table. Probably this apparatus was concerned in the Professor's weird experiments which had so aroused the countryside. He studied it curiously, his eyes for

the moment closed in thought, until a slight sound somewhere near at hand caused him to open them wide. Was the Kell returning?

Quickly he extinguished the lamp and glided to a nearby door, thinking to secrete himself here, and take Kell by surprise. To his consternation the door swung inward at a touch. He prepared instinctively for battle against any foe who might present himself. For a moment he held himself taut; then, nothing of an alarming nature having happened, he drew a swift breath of relief and flashed on his light. He gave vent to a low exclamation. The swiftly darting shaft from the torch had revealed the figure of a girl, bound and gagged.

The girl lay trembling on a wretched bed in a corner of the dilapidated old chamber. O'Hara crossed the room and bent over her. Still wary of a trap he glanced back in the direction of the laboratory door: all safe there. Jimmie made haste to remove the cruel gag from her mouth.

"Courage," he whispered. "Half a minute and you will

be free.”

He produced a knife with a suspiciously long blade and cut her bonds. He then assisted her to her feet, where she reeled dizzily. Realizing the need for fast action he made her sit down while he massaged the bruised arms and ankles, which were badly swollen from the tight ropes. The girl had apparently been in the grip of such terrible fright that she had temporarily lost her power of speech. Mentally he chalked up another score against the Professor as the girl made several ineffectual attempts to speak.

“Easy, kid,” Jimmie whispered. “Just sit tight, and when you feel able you can tell me all about it. I’m going to get him good for this, you can bank on that.”

She thanked him with a faint smile, and of a sudden she found her voice.

“Who are you? Where is father? Oh, tell me, please! I am afraid that horrible man has murdered him. Are you a servant here? Oh, I don’t know whom to trust.”

“My name is Jimmie O’Hara,” replied the reporter briefly; “and I hope you won’t worry about me. I am gunning for the Proff myself. Tell me as quickly as you can what you know about him.” He still kept an eye on the door of the adjoining laboratory. Any moment he expected to hear the sound of the old man’s approach. The room would make an ideal place to ambush the maniac, he had swiftly decided.

“I am Norma Manion. Please don’t delay, but see if you can locate father.” The girl’s voice was agonized. “I heard him groan a half-hour ago, and a little later came a terrific crash. Oh, I’m afraid he’s dead!”

Reluctantly Jimmie gave up the idea of ambushing the Professor.

“Wait here,” he commanded curtly. “If you hear a shot join me as soon as you can. I want to take him alive if I can, but....” With this parting hint he disappeared through the door into the laboratory. Down the carpeted hall he crept to the stairway. Here he stopped and listened, but to his sensitive ears came no sound from below.

“Must have gone down the cellar with the body,” he muttered. “Here goes for a general exploration.”

With more boldness than the occasion perhaps really justified he descended the stairs and proceeded to examine the ground floor rooms minutely. The first was the room through which he had made entrance to the house. It proved to be but a storeroom containing nothing of interest, and he soon decided to waste no more time on it.

The adjoining chamber, however, yielded some surprising finds. He had pushed back a dusty portiere to find himself in what could be nothing less than the Professor’s sleeping chamber. At present the bed was unoccupied, though it showed signs of recent use. The electric torch played swiftly over every possible corner which could constitute a hiding place for an assassin, revealing nothing. Now the ever-searching ray fell upon an old-fashioned dresser, on which was piled a miscellaneous array of articles. Here were combs, brushes, a wig, a huge magnifying glass, and a gold watch. With a barely suppressed exclamation, Jimmie pounced upon the gold timepiece.

Handlon's! So well did he know the particular design of his watch that he could have recognized it in the dark by sense of touch alone. So the old man was not averse to robbery among his other activities! The former two-story man thought fast. Handlon had probably been done in, and the body had been disposed of in some weird manner. The only thing that remained to be done, since the unlucky photographer was evidently past human help, was to cut short the Professor's list of murders.

With the intention of missing no essential detail O'Hara swept the ray of the searchlight around the chamber once more, but discovered no more of importance. Deciding that the sleeping chamber could yield no further clue he shut off the tell-tale ray and stepped noiselessly back into the next room. Here he groped his way around until he encountered a door, which stood open. A moment's cautious exploration with an outstretched foot revealed the top step of a descending staircase. No faintest glimmer of light was visible, but muffled sounds proceeding from the depths told him that someone was below.

With infinite care, feeling his way gingerly over the rickety old steps and fearful that an unexpected creak from one of the ancient boards would at any moment prove his undoing, he commenced the descent. Once a board did groan softly, causing him to stop in his tracks and stand with bated breath. He listened for sign of a movement below, while his heart loudly told off a dozen strokes. Stealthily he continued his progress, until finally soft earth under his feet told him he had reached the cellar bottom.

Now his straining eyes perceived a tiny bit of light, and simultaneously he became conscious of a deathly stench. The damp earth padding his footsteps, he advanced swiftly toward the source of light, which now seemed to lie in stripes across his line of vision. He soon saw that the stairs gave upon a small boarded-off section of the cellar proper, and light was seeping between the boards. Ah, and here was a rickety door, fortuitously equipped with a large knot-hole. O'Hara applied an eye to this--and what he saw nearly ruined even his cast iron nerve.

The Professor was working beside a heavy wooden

cask, from which issued the horrible stench. From time to time a sodden thud told that he was hacking something to pieces with an ax. Now and then he would strain mightily at a dark and bulky thing which lay on the floor, a thing that required considerable strength to lift. It seemed to be getting lighter after each spasm of frenzied chopping. For a second Kell's shadow wavered away from the thing, and the enervated newspaper man saw it plainly. His senses almost left him as he realized that he was witnessing the dismemberment of a human body.

As he hacked the fragments of tissue from the torso the fiend carefully deposited each in the huge cask. At such times a faint boiling sound was heard, and there arose an effluvium that bade fair to overcome even the monster engaged in the foul work. At last the limbs and head had been entirely removed. The Professor evidently decided that the trunk should be left whole, and he put his entire strength into the job of getting it into the cask. It was almost more than he could negotiate, but finally a dull splash told that he had succeeded.

At this moment Jimmie O'Hara came out of his trance. The horrible proceeding had left him faint and shaken, and he wished heartily that he could leave the disgusting place as fast as his legs could carry him. But there was still work to be done and he resolved to get it over.

The lantern! First he must put that out of commission. The maniac would then be at his mercy. Slowly, steadily he stole through the doorway, his eyes glued to the Professor's back. Now he was within a yard of the lantern, and he drew back his foot for the kick.

Next moment Jimmie found himself gazing into the glaring eyes of his intended victim. Instinctively he struck out with the clubbed automatic, but the blow must have fallen short, or else the Professor had developed an uncanny agility. Now to his horror he saw the flashing blade of the bloodstained ax raised on high. He had no time to dodge the blow. He pressed the trigger of the Colt from the position in which he held it.

The bullet grazed the upraised arm. The ax fell

toward O'Hara from fingers lacking strength to retain it, and he grasped it by the handle in midair. The next moment the assassin collected his wits and sprang at him. Silently, the breath of both coming in gasps, the two men strove, each clawing desperately at the other's throat. The reporter fought with the knowledge that should he lose he would never again see the light of day, the other with the fear of the justice that would deal with him.

The maniac hugged his arms tightly about Jimmie, pinioning him so tightly that the reporter could not use his gun. At length their convulsive movements brought the men close to the lantern, and the next instant the cellar was plunged in darkness. A second later the Professor tripped over some hidden obstruction and fell, dragging his opponent with him to the earthen floor. To Jimmie's surprise there was no further movement from the body beneath him. Could the old villain be playing possum? He cautiously shifted his hold and grasped the hidden throat. He pressed the Professor's windpipe for a moment, but there was no answering struggle. Slowly the truth

dawned upon him. The heavy fall to the floor had rendered the older man insensible.

He must work fast. Reaching into his pocket he brought out the ever handy electric torch and flashed it over the features of his prisoner. Kell was breathing heavily. With dexterous hands O'Hara swiftly went through the old man's pockets, removing all which might tend to make that worthy dangerous--an ugly looking pistol of large caliber, a blackjack similar to his own and a small bottle.

The latter item Jimmie examined curiously, finally uncorking it and inhaling the contents. He inhaled, not wisely but too well. The fumes from the vial were nigh overpowering, and he reeled back nauseated. The cork he hastily replaced. Just what the nature of the powerful stuff was he never attempted to discover. One acquaintance was enough.

He staggered to his feet and got the lantern lighted, then sat, gun in hand, waiting for his prisoner's return to his senses. This was becoming increasingly imminent, judging by certain changes in the

Professor's respiration. Finally there came a series of shuddering movements as the man attempted to raise his battered body.

"Get up, you damned butcher," ordered Jimmie, "and march upstairs. And just remember that I've got you covered; don't make any false moves." He prodded the prostrate form of the by now glaring fiend before him. The stench of the place was nearly overcoming him, and again he felt an overwhelming desire to dash madly from that den of evil, and once more breathe God's fresh air. Under the stimulus of several shoves the Professor finally won to his feet and stumbled up the stairs. Jimmie was taking no chances and kept the automatic sharply digging into the ribs of his prisoner. The fight, however, seemed temporarily to have been all taken out of the old man, and he made no resistance as the reporter drove him on up to the laboratory.

The room he found exactly as he left it. At a word from him Norma Manion came from her hiding place in the horrible room where she had been kept prisoner.

With an hysterical scream she fell limply to the floor. The sight of her father's murderer had proved too much for her. Forgetting his prisoner for the moment Jimmie sprang to the girl's side.

Kell chose this moment to make a dash for freedom. His footsteps, however, were not as noiseless as he had intended, and O'Hara whirled just in time to see his quarry about to throw open the hall door. Jimmie dove for his gun, only to encounter the Professor's mysterious vial, which, though forgotten, still lay in his pocket. With no time to think, he acted purely upon instinct. His arm drew back and the bottle flew straight for the Professor's head.

By a miracle the missile missed its mark. Came a shivering crash, as the bottle struck a stud in the massive door. Of a sudden recalling the terrific potency of the contents of that particular bottle, Jimmie gasped in dismay. Norma Manion's safety drove every other thought from his mind. At any cost he must remove her from the proximity of those lethal fumes.

Hastily and without a backward glance, he gathered the girl into his arms and dashed into the room where he had first found her. Ascertaining that she had but swooned he placed her gently on the bed. In some perplexity as to his next move he stared at the beautiful face now so wan and white. Queer that he hadn't noticed the fact before--she was beautiful. He even took a second look, then noting a continued absence of all sound from the laboratory decided to investigate.

Gingerly he pushed open the door, sniffing the air cautiously as he advanced. To his nostrils gradually came a slight scent, which though almost imperceptible made his senses reel. As he approached the hall door he found the atmosphere heavy with the soporific vapors from the broken vial, and he staggered drunkenly.

He gave a start of surprise. On the floor, lying in a grotesque huddle which suggested a most unpleasant possibility, was the inert body of Professor Kell.

Jimmie bent over the body and put an experienced ear

to the heart. Yes, there as a faint beat--very faint. Even as he listened he perceived a slight increase in the respiration. Now the breath began coming in great, choking gasps, only to die suddenly to next to nothing. At last with a rueful sigh Jimmie reached to his hip and produced the private O'Hara flagon. He stooped over the Professor's form once more and by dint of much prying at clenched jaws managed to force a sizeable charge of fiery liquid down the old man's throat. Jimmie had just begun to entertain a strong hope that this latter effort would bring the Professor to life, when his keen ear detected signs of a commotion below.

He sprang from his position over the slowly reviving Kell and leaped to a vantage point beside the door. A blackjack miraculously appeared from some hidden part of his anatomy and the ever-dependable Colt also became in evidence. Now came the banging of a door, muffled voices, a crash as of a chair overturned in the dark. Up rolled a horrible oath, and the same was rendered in a voice to Jimmie sweetly familiar. Came the sound of footsteps on the stairway and several

persons coming along the hall.

“Where in hell is Jimmie?” roared a wicked voice. “If he’s met with any monkey business in this hell-hole I’ll see that the damned place burns to the ground before I leave it!”

Delightedly Jimmie jerked open the door.

“Still alive, Chief,” he chirped as the Old Man strode into the laboratory. Bland was followed by Perry, who seemed to be in a sort of daze. Bringing up the rear were a pair of plainclothesmen whom Jimmie knew very well--almost too well. One of these gentlemen bore a lantern which reminded Jimmie strongly of some he had seen that night guarding an open ditch in the public highway.

The Professor had fully regained consciousness and was struggling to his feet. As for Norma Manion, she had suddenly appeared, leaning weakly against the door casing, and was surveying the group in great alarm.

After being assured by O'Hara that they were her friends she smiled wanly. To Bland and the others she was, of course, an unexpected factor in the weird night's doings, and for several moments they regarded her curiously.

At length Jimmie, sensing the question in the Old Man's eyes, elected to offer a few words of explanation.

"Miss Manion has just been through a terrible experience," he said. "She and her father have been for some time at the mercy of this monster"--indicating Kell--"and her nerves are completely shattered. We'd better get her out of this as quickly as we can."

"Mike!" Hard Boiled Bland glared at one of the officers. "Don't stand there with your teeth in your gums like that. Take this girl out to my car and let her lie down. She needs a stimulant, too. If you search my car and find any red liquor in the left back door pocket, I don't know a thing about it. And stay with her so she won't be afraid to go to sleep."

She smiled in silent gratitude and allowed the plainclothesman to lead her away from that chamber of horror.

The reporter lost no time in telling Bland of his failure to find Skip Handlon. He went on to acquaint his Chief with the facts of all that had occurred while he had been at the Professor's house.

The fiery old fellow listened grimly. When Jimmie came to the story of the corpse and the cask the editor breathed one word, "Manion!"

Jimmie nodded sadly. All eyes turned to the dejected huddle on the floor that was Professor Kell. Finally Bland could wait no longer, but fixed a terrible eye on the murderer and demanded harshly, "Where's Handlon?"

Now the Professor burst into a fit of insane laughter, laughter that curdled the blood of the listeners.

"You ask me that! It's almost too good. Hee-hee! You sent your two precious reporters out to my house to

pry into my secrets, and thought to display my name all over your yellow sheet; but you forgot that you were dealing with Professor Anton Kell, didn't you?" The last he fairly shrieked. "A lot of people have tried to intrude upon me before, but none ever escaped me!"

"We know that," cut in Jimmie, for he was getting impatient and the old man's boastings seemed out of place. "You are slated for the rope anyway, after what I discovered down cellar." He jerked his eyes in the direction of the door significantly. "Now we propose to find Handlon, and the better it will be for you if you tell us what you have done with him. Otherwise...."

"You can go to hell!" screamed the maniac. "If you are so clever, find out for yourselves. He isn't so far away that you couldn't touch him by reaching out your hand. In fact, he's been with you quite a while. Hee-hee-hee! Well, if you must know--there he is!" With an insane chuckle he pointed at Horace Perry. And Perry did a strange thing.

"Yes, you fiend, here I am!" Whose voice was that?

Was it Perry speaking, or was it Skip Handlon? Most assuredly Perry stood before them, but the voice, in a subtle manner, reminded the group strongly of poor old Skip.

As he spoke Perry had launched himself at the Professor's throat and had to be restrained by the others. Savagely he fought them but slowly and surely they overcame his struggles and placed him, writhing, in a chair.

Of a sudden Bland leaned forward and scrutinized Perry's face sharply. Had the reporter gone insane too? The pupils of the eyes had taken on a sort of queer contraction, a fixed quality that was almost ludicrous. He looked like a man under hypnosis. He had gone limp in their grasp, but now suddenly he stiffened. The eyes underwent another startling change, this time glowing undoubtedly with the look of reason. Bland was mystified and waited for Perry to explain his queer conduct. The latter seemed finally to come to. Simultaneously he realized that his peculiar lapse from consciousness had been observed by the others.

“Guess I may as well admit it,” he said with a wry smile. “Ever since I came back from my assignment with Kell I have had a hell of a time. Half the time I have been in a daze and have not had the least idea what I was doing. Funny part of it is that I have seemed to keep right on doing things even while I was out of my head.” He told briefly of the visions he had had in which he had seemed to contend with his brother reporter, the horrid sensations as he felt himself overcome, the black oblivion in which he then found himself, and the mysterious manner in which he had left Keegan on that ill-fated assignment.

“What have you done to Handlon?” Jimmie’s voice cut in. He was standing over the form of the maniac, rigid and menacing. “You have exactly two minutes to go.”

“Find out for yourself!” snarled the bruised and battered fiend.

“I will,” was the answer, and on the instant a horrible shriek rent the air. Jimmie had quickly grasped both of the Professor’s arms at the wrists and was slowly twisting them in a grip of iron. Kell’s face went white,

the lips writhed back over toothless gums, the eyes closed in the supreme effort to withstand the excruciating pain. Then--

“Enough, enough!” he screamed.

O’Hara eased the pressure slightly but retained his hold upon the clawlike hands. “Talk fast,” he ordered.

The old man struggled futilely in the grasp of the powerful reporter, finally glancing in the direction of the others. Would they show signs of pity? Surely not Hard Boiled Bland. The Chief was watching the struggles of the victim through a cloud of tobacco smoke which he was slowly exhaling through his nose. The plainclothesman displayed no sign of interest at all. The game was up!

“Very well,” he said sullenly. “Handlon and Perry are both occupying the same body.”

“Wh-a-a-t?” roared Bland. “Jimmie, I guess you’ll have to put the screws to him some more. He’s trying to make fools of us at the last minute!”

“No, no!” screamed the Professor. “What I say is true. I have been working for years on my system of de-astralization. This last year I at length perfected my electric de-astralizer, which amplifies and exerts the fifth influence of de-cohesion.”

The whole party began to look uneasy and gazed apprehensively at the huge Crookes tube which still stood in its supporting frame on the table.

“I have been forced to experiment on animals for the most part,” the Professor continued. “I succeeded in de-astralizing a dog and a bull and caused them to exchange bodies. The bodies continued to function. I was enthusiastic. Other experiments took place of which I will not tell you. Finally I began to long for a human subject on which to try my fifth influence.”

“Just get down to cases, if you don’t mind, Kell.” The Chief wanted action. “Suppose you tell us just what you did to Handlon and where we can find him. I may as well mention that your life depends upon it. If we find that you have done for him, something worse than death may happen to you.” The tone was

menacing. Although Handlon was a comparatively late acquisition to the old Chief's staff, still he had been loyal to the paper.

"When your two damned reporters entered my driveway," Kell resumed. "I saw them coming through a powerful glass which I always have on hand. I had no desire to see them, but they forced themselves upon me. At last I determined that they should furnish material for my experiments.

"If your men had looked into the grove behind the barn they would have found the automobile which furnished two more subjects I was keeping on hand in a room upstairs. Old Manion and his daughter gave me quite a bit of trouble, but I kept them drugged most of the time. He broke out of the room to-night though, and I had to kill him. It was self defense," he added slyly.

"Anyway, I found it was possible to make two astrals exchange bodies. But I also wanted to see if it were possible to cause two astrals to occupy the same body at the same time, and if so what the result would be. I

found out. It was rare sport to watch your star reporter leave my house. He was damned glad to leave, I believe....” Again came the insane cackle.

“Guess we have to believe him whether we want to or not.” The detective came to life. “How about making him release Handlon’s--what d’ye call it?--astral--from Perry’s body?”

“Just a moment.” The voice now was unmistakably Handlon’s, though it was issuing from the throat of Perry. “In the minute I have in consciousness let me suggest that before you do any more de-astralizing you *locate my body*. Until then, if I am released from this one I am a dead man.”

The words struck the group dumb. Where *was* Handlon’s body? Could the Professor produce it?

That worthy looked rather haunted at that moment, and they began to see the fear of death coming upon him.

“Mercy, mercy!” he begged as the four men started to

advance upon him. "As soon as I had de-astralized Handlon I destroyed his body in my pickling barrel down cellar. But there is another way..." He paused, uncertain as to how his next words would be received. "Go out and get the Manion girl. She can be de-astralized and friend Handlon can have her body."

At this suggestion, advanced so naïvely, the four men recoiled in horror. It was entirely too much even for Hard Boiled Bland, and he could hardly restrain himself from applying the editorial fist to the leering face before him. Undoubtedly Professor Kell was hopelessly insane, and for that reason he held himself in leash.

"Kell, you are slated to pull off one more stunt," Jimmie addressed the cringing heap. "You know what it is. Get busy. And just remember that I am standing over here"--he indicated a corner well separated from the rest--"with this cannon aimed in your direction. If things aren't just according to Hoyle, you get plugged. Get me?"

"What about it, men?" Bland spoke up. "Is it going to

be treating Handlon right to de-astralize him now? It will be his last chance to have a body on this earth.”

“Unfortunately that body never belonged to Handlon,” said O’Hara. “Hence I fail to see why Perry should be discommoded for the balance of his life with a companion astral. Perry is clearly entitled to his own body, free and unhampered. Friend Skip is out of luck, unless--Well, I don’t mind telling you, Kell, that you just gave me an idea. Snap into it now!”

The Professor dragged himself to his feet and under the menace of the automatic fumbled under the table until he had located the intricate apparatus before mentioned.

“Now if Mr. Perry--or Handlon--will kindly recline at full length on this table,” he said with an obscene leer, “the experiment will begin.”

“Just remember, Kell, this is no experiment,” advised Bland, fixing the Professor with an ugly eye. “You do as you’re told.”

The other made no reply, but threw a hidden switch. Perry, lying flat on his back on the ancient table, suddenly found himself being bathed by what seemed to be a ray of light, and yet was not a ray of light. What was it? It was surely not visible, yet it was tangible. A terrific force was emanating from that devilish globe above him, drawing him out of himself--or--no--was he expanding? Again his ears became filled with confused, horrible sounds, the outlines of the room faded from sight, he felt a strange sense of inflation ... of lightness.... Oblivion!

IMAGEDescription

From where the others sat a gasp of wonder went up. At the first contact of the switch there had been a momentary flash of greenish light within the bulb, and then a swift transition to a beautiful orange. It

had then faded altogether, leaving the glass apparently inert and inactive.

But it was not so! The form lying beneath the bulb was evidently being racked with untold tortures. The face became a thing of horror. Now it had twisted into a grotesque semblance of Handlon's--now it again resembled Perry's. The Professor quietly increased the pressure of the current. From the bulb emanated a steel gray exhalation of what must be termed light, and yet so real it was seemingly material. Assuredly it was not a ray of light as we understand light. It came in great beating throbs, in which the actual vibrations were entirely visible. Under each impact the body of Perry seemed to change, slowly at first, then with increasing speed. The body was now swelled to enormous size. Bland reached forward to touch it.

"This de-cohering influence," the Professor was murmuring, almost raptly, "causes the atoms that go to make a living body repel one another. When the body is sufficiently nebulized, the soul--Back! Back, you fool!" he suddenly shrieked, grasping Bland by the arm. "Do you want to kill him?"

Bland hurriedly retreated, convinced perforce that Kell's alarm was genuine. The editorial fingers had penetrated the subject's garments without resistance and sank into the body as easily as if it were so much soft soap!

The body continued to expand until at length even the hard-headed plainclothesman realized that it had been reduced to a mere vapor. Within this horrid vaporized body, which nearly filled the room and which had now lost all semblance to a man, could be discerned two faint shapes. Swiftly the Professor extinguished the lantern. The shapes, vague though they were, could be recognized as those of Horace Perry and Skip Handlon. And they were at strife!

All eyes were now focused on Professor Kell, who was evidently waiting for something to happen. The two apparitions within the body-cloud were at death grips. One had been overcome and was temporarily helpless. It was that of Handlon. And then again the astral of Perry forcibly ousted that of Handlon from the cloud-cyst. And at that instant Professor Kell shut off the influence-tube.

At once a terrific metamorphosis took place. There came a sharp sound almost like a clap of thunder, with the slight exception that this was occasioned by exactly the reverse effect. Instead of being an explosion it might more properly be termed an *inplosion*, for the mist-cloud suddenly vanished. The de-cohering influence having been removed, the cloud had condensed into the form of Perry. Apparently none the worse, he was even now beginning to recover consciousness. The astral of Handlon was no longer visible, though hovering in the vicinity.

Perry's body was again his own.

At this time Jimmie O'Hara elected to start something new by hitting the Professor a workmanlike blow on the back of the head with the butt of his automatic. The next thing Bland or anyone else present knew the unconscious body of the Professor was on the table and Jimmie was groping for the concealed switch. At length he found it, and the green flash of light appeared in the bulb, followed by the brilliant orange manifestation.

“What in hell are you doing?” gasped Bland.

“De-astralizing the Professor,” replied O’Hara cheerfully. “Don’t you get the idea yet? Watch!”

Fascinated, the four men saw the terrific emanation take its baleful effect. As before, the body commenced to expand and gradually took on a misty outline. Larger and larger it grew, until finally it had become a vast cloud of intangible nothingness which filled the room like some evil nebula.

A cry of consternation from the detective aroused Jimmie. Skip Handlon’s astral had appeared within the field of the nebula to fight for possession. There ensued what was perhaps the weirdest encounter ever witnessed. Though he was in poor physical shape, the Professor seemed to have an extremely powerful astral; and for some time the spectators despaired of Handlon’s victory. Once the latter, evidently realizing that the powerful influence tube had rendered him visible, glanced sharply in Jimmie’s direction. O’Hara was considerably puzzled at this, but watched the progress of the struggle tensely. At

length the moment seemed to arrive which the reporter's astral had been awaiting. It turned tail and fled away from the astral of the Professor, disappearing beyond the outer confines of the nebula.

Jimmie suddenly divined the other's purpose and dived for the hidden switch. As he had anticipated, Handlon had finally given up the attempt to overcome the astral of Kell by force and had made up his mind to accomplish his end by strategy. Almost on the instant that Jimmie's hand closed on the switch the reporter's astral again leaped into the field of the nebula. Fiercely it signalled to the former second story man to shut off the current, but the admonition was unnecessary, for Jimmie had already done so.

Swiftly the cloud-cyst faded. Even as the group caught a fleeting sight of Skip Handlon, the last that mortal eyes would ever see of him as he actually was, there came a violent disturbance at the edge of the shrinking nebula. Would the speed of condensation of the atoms which comprised the body of Professor Kell serve to shut out the pursuing astral of Kell?

Even Bland held his breath!

The cloud lost its luminous quality, the action of condensation increasing in speed. It was barely visible in the enshrouding gloom. An astral had long since been enveloped within the rapidly accumulating substance. Came a sudden clap of sound as before, and the final act of resolution had been accomplished. Whether the Professor had succeeded in regaining a position within the cloud-cyst before the crucial second none could say.

Jimmie relighted the lantern. Apparently the effect of the love tap administered by his automatic was more or less of a lasting character, and the men were put to some ado to restore the body of Kell to consciousness. At length their efforts began to bear fruit, however, and it became expedient to remove the patient to the softer couch in the sitting room below. As they moved forward to lay hold of the limp body a figure appeared in the doorway to the hall. It was the plainclothesman, Riley.

“How about getting under way for town,” he wanted

to know. "Is the old party croaked yet? Miss Manion has had a fierce time and says she won't stay near this house another minute. I don't like this place myself either. Do you know I just got kicked by a poll parrot? Let's get away from here."

"Hold on, Riley, what are you talking about?" growled Bland. "Kicked by a poll parrot! You're--"

"That's all right, Chief," broke in the now thoroughly cheerful Perry. "That jackass I shot could probably have told us all about it. I positively know the beast could talk."

"Humph!" snorted Bland, "Well, if a donkey can talk, and a bull can bite, and a hound can hook, why shouldn't a parrot--Judas Priest, I'm getting as crazy as the rest of you! Hurry up and get Kell downstairs so we can see who he is. There I go again! Oh, go lie down, Riley."

"But look, Bland, look!" Riley was pointing a demoralized finger at a cage in the corner. He tugged frantically at Bland's coat sleeve. "See what's in

there, won't you? I--well, I did find some liquor in your car, and Miss Manion made me take some. I--I didn't know it would do this to me. Look in there; please, Mr. Bland!"

Bland gave Riley a dark look, but nevertheless he reached for O'Hara's flashlight. In the cage two yellow eyes blinked sleepily out at him. Perry began to laugh.

"Why, there's nothing in there but a cat. Skip and I heard it purring when we first came in here this afternoon. Guess Riley--"

"Great God, Jimmie, give me your gun!" Hard Boiled Bland for the moment failed to merit his sobriquet. The torch in his hand threw a trembling beam full into the cage. "It's a snake! And--there! It's doing it again!"

A snake it was, indubitably, a huge black specimen with bright yellow stripes. Bland's frenzied yell seemed not to have excited it at all, for now the sleek fellow had arched its body neatly and was calmly

licking its sides with a long forked tongue. After a moment it halted the operation long enough to rub its jaw against a bar of its cage, and gave vent to a sociable mew!

Even this could not dash the spirits of Horace Perry. He laughed delightedly again as he laid Bland by the arm.

“That creature is perfectly harmless, Chief,” he told the editor. “Somewhere I suppose there’s a mighty dangerous kitty cat at large, but there’s no sense in taking it out on this poor reptile. Let’s live and let live.”

With a show of reluctance Bland returned Jimmie’s automatic, then strode over to where lay the form of Kell. Perry and O’Hara lingered by the cage long enough to arrange a plan to let the snake out doors as soon as opportunity offered, after which they joined their Chief. Riley went out to resume his vigil in Bland’s car, while his fellow sleuth prepared to light the way downstairs. Under his guidance the sick man was carried below without mishap.

Downstairs the now conscious form of the venerable Professor was laid out on the ancient sofa until his senses could clear a bit. Presently the eyelids fluttered open and a feeble voice asked, “Where the deuce am I, and how did all you guys get here?”

A joyous gasp went up. That voice! Although uttered in somewhat the same vocal quality as Kell’s the intonation and accents had strangely altered. O’Hara leaned eagerly over the figure on the couch. The question he asked was startling in its incongruity:

“How are you feeling, *Skip!*”

“Rotten,” was the reply from the lips of Kell. “What hit me such a crack on the dome? I feel as if I had been dragged through a knot-hole. Lemme up.”

“Stay still,” commanded O’Hara, kindly but firmly. “You aren’t fit to move yet. You are going on a long ride and will need your strength. Don’t talk, either.”

A half-hour later they left the house. In the front yard the editor called a hasty conclave which included the

entire party. Hard Boiled Bland has never been known to talk so much at a stretch, before or since.

“Before we start back,” he began, “we had better come to an understanding. In the first place--Skip, come over here a minute.”

Norma Manion uttered an involuntary cry of fear as the aged form of Kell passed by her. Skip’s instant response to his name had, of course, been perfectly natural to him. But it had an odd effect on the others.

“Miss Manion, and gentlemen,” Bland went on, with a bow of mock ceremony, “I want you to meet Mister--er, Mister--oh hell, call him Saunders. This is Mr. Kenneth Saunders, ladies and gentlemen. When he gets a shave and has his new face patched up I believe you will like his appearance much more than you do now.

“Seriously though, folks, I hope that with a little fixing up the gentleman will hardly resemble Professor Anton Kell. Kell is dead. Obviously, however, this gentleman can hardly continue his existence as Skip

Handlon. Hence--well, hence Mr. Saunders. And don't forget the name.

"Now another little matter. This house has proven a curse to humanity. What has transpired here need never be known. Would it not be the wiser to eliminate all traces of to-night's happenings? There is a way." He looked significantly at the others.

"You mean--" began Perry.

"That we destroy all traces of Professor Kell's villainy. Although he is no more, still someone might notice that *his body actively remains*. And no one wants to do any explaining."

"It's the only way we can protect Handlon," one of the sleuths ruminated, half to himself. "No judge would ever believe a word about this de-astralization business. The chances are we would all go to the booby hatch and Handlon would go to prison for Kell's crimes."

"There were four of us that witnessed the fact of the--

the soul transfusion, though,” Perry objected.

“Wouldn’t that be enough to clear Skip? Besides, wouldn’t it be possible for us to lead a jury out here and duplicate the experiment?”

“Too much undesirable publicity,” growled Bland, who for once in his life had found reason to keep something good out of the headlines. “What do you say, people?”

“I move we move,” from the detective who had had the uncomfortable job of attending to Norma Manion.

“Gentleman, I believe we understand each other,” said Jimmie quietly. “Now I am going into the barn”—significantly—“to see if everything’s all right. While I am there something *might* happen. You understand?”

The others nodded silent assent.

In the snug seat of Jimmie’s speedster Norma Manion shivered as she followed the direction indicated by her companion’s finger. It was that darkest hour which comes just before the dawn.

To the westward could be perceived a dull, red glow, which, even as they watched with fascinated eyes, developed into an intense glare. Gradually the fading stars became eclipsed in the greater glory.

Three cars, motors throbbing as if eager to be gone, stood a space apart on the main road. The car behind O'Hara's was the Manion machine, now occupied by Bland and Riley. The remaining one was a touring car and contained the balance of the party. Perry was at the wheel, and beside him sat the Handlon-Kell-Saunders combination.

"Thus passes a den of horror," whispered Jimmie to his companion.

"It is the funeral pyre of my father," the girl answered simply. She had long since recovered from her initial outburst of grief at her loss, and now watched the progress of the conflagration dry-eyed. At length Jimmie slipped an arm protectingly about the trembling shoulders.

"You have seen enough," he said. As the three cars

raced from the scene of the holocaust, faint streamers
in the east told of the rising orb of day.

“Good-by, Keegan, forever,” murmured Norma.

“Amen,” O’Hara devoutedly agreed.

**#18 From the Ocean's Depths, and the sequel,
Into the Ocean's Depths, by Sewell Peaslee
Wright:**

Man came from the sea. Mercer, by his thought-telegraph, learns from the weirdly beautiful ocean-maiden of a branch that returned there.

- - -

From somewhere out on the black, heaving Atlantic, the rapid, muffled popping of a speed-boat's exhaust drifted clearly through the night.

I dropped my book and stretched, leaning back more comfortably in my chair. There was real romance and adventure! Rum-runners, seeking out their hidden port with their cargo of contraband from Cuba.

Heading fearlessly through the darkness, fighting the high seas, still running after the storm of a day or so before, daring a thousand dangers for the sake of the straw-packed bottles they carried. Sea-bronzed men, with hard, flat muscles and fearless eyes; ready guns slapping their thighs as they--

Absorbed in my mental picture of these modern free-booters, the sudden alarm of the telephone startled me like an unexpected shot fired beside my ear.

Brushing the cigarette ashes from my smoking-jacket, I crossed the room and snatched up the receiver.

"Hello!" I snapped ungraciously into the mouthpiece. It was after eleven by the ship's clock on the mantel, and if--

"Taylor?" The voice--Warren Mercer's familiar voice--rattled on without waiting for a reply. "Get in your car and come down here as fast as possible.

Come just as you are, and--"

"What's the matter?" I managed to interrupt him.

"Burglars?" I had never heard Mercer speak in that high-pitched, excited voice before; his usual speech was slow and thoughtful, almost didactic.

"Please, Taylor, don't waste time questioning me. If it weren't urgent, I wouldn't be calling you, you know. Will you come?"

"You bet!" I said quickly, feeling rather a fool for ragging him when he was in such deadly earnest. "Have--"

The receiver snapped and crackled; Mercer had hung up the instant he had my assurance that I would come. Usually the very soul of courtesy and consideration, that act alone would have convinced me that there was an urgent need for my presence at The Monstrosity. That was Mercer's own name for the impressive pile that was at once his residence and his laboratory.

I threw off the smoking-jacket and pulled on a woolen golfing sweater, for the wind was brisk and sharpish. In two minutes I was backing the car out of the garage; a moment later I was off the gravelled drive and tearing down the concrete with the accelerator all the way down, and the black wind shrieking around the windshield of my little roadster.

My own shack was out of the city limits--a little place I keep to live in when the urge to go fishing seizes me, which is generally about twice a year. Mercer picked the place up for me at a song.

The Monstrosity was some four miles further out from town, and off the highway perhaps a half-mile more.

I made the four miles in just a shade over that many minutes, and clamped on the brakes as I saw the entrance to the little drive that led toward the sea, and Mercer's estate.

With gravel rattling on my fenders, I turned off the concrete and swept between the two massive, stuccoed pillars that guarded the drive. Both of them

bore corroded bronze plates, "The Billows," the name given The Monstrosity by the original owner, a newly-rich munitions manufacturer.

The structure itself loomed up before me in a few seconds, a rambling affair with square-shouldered balconies and a great deal of wrought-iron work, after the most flamboyant Spanish pattern. It was ablaze with light. Apparently every bulb in the place was burning.

Just a few yards beyond the surf boomed hollowly on the smooth, shady shore, littered now, I knew, by the pitiful spoils of the storm.

As I clamped on my brakes, a swift shadow passed two of the lower windows. Before I could leap from the car, the broad front door, with its rounded top and circular, grilled window, was flung wide, and Mercer came running to meet me.

He was wearing a bathrobe, hastily flung on over a damp bathing suit, his bare legs terminating in a pair of disreputable slippers.

“Fine, Taylor!” he greeted me. “I suppose you’re wondering what it’s all about. I don’t blame you. But come in, come in! Just wait till you see her!”

“Her?” I asked, startled. “You’re not in love, by any chance, and bringing me down here like this merely to back up your own opinion of them eyes and them lips, Mercer?”

He laughed excitedly.

“You’ll see, you’ll see! No, I’m not in love. And I want you to help, and not admire. There are only Carson and myself here, you know, and the job’s too big for the two of us.” He hurried me across the broad concrete porch and into the house. “Throw the cap anywhere and come on!”

Too much amazed to comment further, I followed my friend. This was a Warren Mercer I did not know. Usually his clean-cut, olive-tinted face was a polite mask that seldom showed even the slightest trace of emotion. His eyes, dark and large, smiled easily, and shone with interest, but his almost beautiful mouth,

beneath the long slim mustache, always closely cropped, seldom smiled with his eyes.

But it was his present excited speech that amazed me most. Mercer, during all the years I had known him, had never been moved before to such tempestuous outbursts of enthusiasm. It was his habit to speak slowly and thoughtfully, in his low, musical voice; even in the midst of our hottest arguments, and we had had many of them, his voice had never lost its calm, unhurried gentleness.

To my surprise, instead of leading the way to the really comfortable, although rather gaudy living room, Mercer turned to the left, towards what had been the billiard room, and was now his laboratory.

The laboratory, brilliantly illuminated, was littered, as usual, with apparatus of every description. Along one wall were the retorts, scales, racks, hoods and elaborate set-ups, like the articulated glass and rubber bones of some weird prehistoric monster, that demonstrated Mercer's taste for this branch of science. On the other side of the room a

corresponding workbench was littered with a tangle of coils, transformers, meters, tools and instruments, and at the end of the room, behind high black control panels, with gleaming bus-bars and staring, gaping meters, a pair of generators hummed softly. The other end of the room was nearly all glass, and opened onto the patio and the swimming pool.

Mercer paused a moment, with his hand on the knob of the door, a strange light in his dark eyes.

“Now you’ll see why I called you here,” he said tensely. “You can judge for yourself whether the trip was worth while. Here she is!”

With a gesture he flung open the door, and I stared, following his glance, down at the great tiled swimming pool.

It is difficult for me to describe the scene. The patio was not large, but it was beautifully done. Flowers and shrubs, even a few small palms, grew in profusion in the enclosure, while above, through the movable glass roof--made in sections to disappear in fine

weather--was the empty blackness of the sky.

None of the lights provided for the illumination of the covered patio was turned on, but all the windows surrounding the patio were aglow, and I could see the pool quite clearly.

The pool--and its occupant.

We were standing at one side of the pool, near the center. Directly opposite us, seated on the bottom of the pool, was a human figure, nude save for a great mass of tawny hair that fell about her like a silken mantle. The strangely graceful figure of a girl, one leg stretched out straight before her, the other drawn up and clasped by the interlocked fingers of her hands. Even in the soft light I could see her perfectly, through the clear water, her pale body outlined sharply against the jade green tiles.

I tore myself away from the staring, curious eyes of the figure.

"In God's name, Mercer, what is it? Porcelain?" I

asked hoarsely. The thing had an indescribably eery effect.

He laughed wildly.

“Porcelain? Watch ... *look!*”

My eyes followed his pointing finger. The figure was moving. Gracefully it arose to its full height. The great cloud of corn-colored hair floated down about it, falling below the knees. Slowly, with a grace of movement comparable only with the slow soaring of a gull, she came toward me, walking on the bottom of the pool through the clear water as though she floated in air.

Fascinated, I watched her. Her eyes, startlingly large and dark in the strangely white face, were fixed on mine. There was nothing sinister in the gaze, yet I felt my body shaking as though in the grip of a terrible fear. I tried to look away, and found myself unable to move. I felt Mercer’s tense, sudden grip upon my arm, but I did not, could not, look at him.

“She--she’s smiling!” I heard him exclaim. He laughed, an excited, high-pitched laugh that irritated me in some subtle way.

She was smiling, and looking up into my eyes. She was very close now, within a few feet of us. She came still closer, until she was at my very feet as I stood on the raised ledge that ran around the edge of the pool, her head thrown back, staring straight up at me through the water.

I could see her teeth, very white between her coral-pink lips, and her bosom rising and falling beneath the veil of pale gold hair. She was breathing *water*!

Mercer literally jerked me away from the edge of the pool.

“What do you think of her, Taylor?” he asked, his dark eyes dancing with excitement.

“Tell me about it,” I said, shaking my head dazedly.

“She is not human?”

“I don’t know. I think so. As human as you or I. I’ll tell you all I know, and then you can judge for yourself. I think we’ll know in a few minutes, if my plans work out. But first slip on a bathing suit.”

I didn’t argue the matter. I let Mercer lead me away without a word. And while I was changing, he told me all he knew of the strange creature in the pool.

“Late this afternoon I decided to go for a little walk along the beach,” Mercer began. “I had been working like the devil since early in the morning, running some tests on what you call my thought-telegraph. I felt the need of some fresh sea air.

“I walked along briskly for perhaps five minutes, keeping just out of reach of the rollers and the spray. The shore was littered with all sorts of flotsam and jetsam washed up by the big storm, and I was just thinking that I would have to have a man with a truck come and clean up the shore in front of the place, when, in a little sandy pool, I saw--*her*.

“She was laying face down in the water, motionless,

her head towards the sea, one arm stretched out before her, and her long hair wrapped around her like a half-transparent cloak.

“I ran up and lifted her from the water. Her body was cold, and deathly white, although her lips were faintly pink, and her heart was beating, faintly but steadily.

“Like most people in an emergency. I forgot all I ever knew about first aid. All I could think of was to give her a drink, and of course I didn’t have a flask on my person. So I picked her up in my arms and brought her to the house as quickly as I could. She seemed to be reviving, for she was struggling and gasping when I got here with her.

“I placed her on the bed in the guest room and poured her a stiff drink of Scotch--half a tumblerful, I believe. Lifting up her head, I placed the glass to her lips. She looked up me, blinking, and took the liquor in a single draught. She did not seem to drink it, but sucked it out of the glass in a single amazing gulp--that’s the only word for it. The next instant she was off the bed, her face a perfect mask of hate and agony.

“She came at me, hands clutching and clawing, making odd murmuring or mewling sounds in her throat. It was then that I noticed for the first time that her hands were webbed!”

“Webbed?” I asked, startled.

“Webbed,” nodded Mercer solemnly. “As are her feet. But listen, Taylor. I was amazed, and not a little rattled when she came for me. I ran through the French windows out into the patio. For a moment she ran after me, rather awkwardly and heavily, but swiftly, nevertheless. Then she saw the pool.

“Apparently forgetting that I existed, she leaped into the water, and as I approached a moment later I could see her breathing deeply and gratefully, a smile of relief upon her features, as she lay upon the bottom of the pool. Breathing, Taylor, on the bottom of the pool! Under eight feet of water!”

“And then what, Mercer?” I reminded him, as he paused, apparently lost in thought.

“I tried to find out more about her. I put on my bathing suit and dived into the pool. Well, she came at me like a shark, quick as a flash, her teeth showing, her hands tearing like claws through the water. I turned, but not quickly enough to entirely escape. See?” Mercer threw back the dressing robe, and I saw a ragged tear in his bathing suit on his left side, near the waist. Through the rent three deep, jagged scratches were clearly visible.

“She managed to claw me, just once,” Mercer resumed, wrapping the robe about him again. “Then I got out and called on Carson for help. I put him into a bathing suit, and we both endeavored to corner her. Carson got two bad scratches, and one rather serious bite that I have bandaged. I have a number of lacerations, but I didn’t fare so badly as Carson because I am faster in the water than he is.

“The harder we tried, the more determined I became. She would sit there, calm and placid, until one of us entered the water. Then she became a veritable fury. It was maddening.

“At last I thought of you. I phoned, and here we are!”

“But, Mercer, it’s a nightmare!” I protested. We moved out of the room. “Nothing human can live under water and breathe water, as she does!”

Mercer paused a moment, staring at me oddly.

“The human race,” he said gravely, “came up out of sea. The human race as we know it. Some may have gone back.” He turned and walked away again, and I hurried after him.

“What do you mean. Mercer? ‘Some may have gone back?’ I don’t get it.”

Mercer shook his head, but made no other reply until we stood again on the edge of the pool.

The girl was standing where we had left her, and as she looked up into my face, she smiled again, and made a quick gesture with one hand. It seemed to me that she invited me to join her.

“I believe she likes you, Taylor,” said Mercer thoughtfully. “You’re light, light skin, light hair. Carson and I are both very dark, almost swarthy. And in that white bathing suit--yes, I believe she’s taken a fancy to you!”

Mercer’s eyes were dancing.

“If she has,” he went on, “it’ll make our work very easy.”

“What work?” I asked suspiciously. Mercer, always an indefatigable experimenter, was never above using his friends in the benefit of science. And some of his experiments in the past had been rather trying, not to say exciting.

“I think I have what you call my thought-telegraph perfected, experimentally,” he explained rapidly. “I fell asleep working on it at three o’clock, or thereabouts, this morning, and some tests with Carson seem to indicate that it is a success. I should have called you to-morrow, for further test. Nearly five years of damned hard work to a successful

conclusion, Taylor, and then this mermaid comes along and makes my experiment appear about as important as one of those breakers rolling in out there!”

“And what do you plan to do now?” I asked eagerly, glancing down at the beautiful pale face that glimmered up at me through the clear water of the pool.

“Why, try it on her!” exclaimed Mercer with mounting enthusiasm. “Don’t you see, Taylor? If it will work on her, and we can direct her thoughts, we can find out her history, the history of her people! We’ll add a page to scientific history--a whole big chapter!--that will make us famous. Man this is so big it’s swept me off my feet! Look!” And he held out a thin, aristocratic brown hand before my eyes, a hand that shook with nervous excitement.

“I don’t blame you,” I said quickly. “I’m no savant, and still I see what an amazing thing this is. Let’s get

busy. What can I do?"

Mercer reached around the door into the laboratory and pressed a button.

"For Carson," he explained. "We'll need his help. In the meantime, we'll look over the set-up. The apparatus is strewn all over the place."

He had not exaggerated. The set-up consisted of a whole bank of tubes, each one in its own shielding copper box. On a much-drilled horizontal panel, propped up on insulators, were half a score of delicate meters of one kind and another, with thin black fingers that pulsed and trembled. Behind the panel was a tall cylinder wound with shining copper wire, and beside it another panel, upright, fairly bristling with knobs, contact points, potentiometers, rheostats and switches. On the end of the table nearest the door was still another panel, the smallest of the lot, bearing only a series of jacks along one side, and in the center a switch with four contact points. A heavy, snaky cable led from this panel to the maze of apparatus further on.

“This is the control panel,” explained Mercer. “The whole affair, you understand, is in laboratory form. Nothing assembled. Put the different antennae plug into these jacks. Like this.”

He picked up a weird, hastily built contrivance composed of two semi-circular pieces of spring brass, crossed at right angles. On all four ends were bright silvery electrodes, three of them circular in shape, one of them elongated and slightly curved. With a quick, nervous gesture, Mercer fitted the thing to his head, so that the elongated electrode pressed against the back of his neck, extending a few inches down his spine. The other three circular electrodes rested on his forehead and either side of his head. From the center of the contrivance ran a heavy insulated cord, some ten feet in length, ending in a simple switchboard plug, which Mercer fitted into the uppermost of the three jacks.

“Now,” he directed, “you put on this one”—he adjusted a second contrivance upon my head, smiling as I shrank from the contact of the cold metal on my skin—“and think!”

He moved the switch from the position marked "Off" to the second contact point, watching me intently, his dark eyes gleaming.

Carson entered, and Mercer gestured to him to wait. Very nice old chap, Carson, impressive even in his bathing suit. Mercer was mighty lucky to have a man like Carson....

Something seemed to tick suddenly, somewhere deep in my consciousness.

"Yes, that's very true: Carson is a most decent sort of chap." The words were not spoken. I did not *hear* them, I *knew* them. What--I glanced at Mercer, and he laughed aloud with pleasure and excitement.

"It worked!" he cried. "I received your thought regarding Carson, and then turned the switch so that you received my thought. And you did!"

Rather gingerly I removed the thing from my head and laid it on the table.

“It’s wizardry, Mercer! If it will work as well on *her....*”

“It will, I know it will!--if we can get her to wear one of these,” replied Mercer confidently. “I have only three of them; I had planned some three-cornered experiments with you, Carson, and myself. We’ll leave Carson out of to-night’s experiment, however, for we’ll need him to operate this switch. You see, as it is now wired only one person transmits thoughts at a time. The other two receive. When the switch is on the first contact, Number One sends, and Numbers Two and Three receive. When the switch is on Number Two, then he sends thoughts, and Numbers One and Three receive them. And so on. I’ll lengthen these leads so that we can run them out into the pool, and then we’ll be ready. Somehow we must induce her to wear one of these things, even if we have to use force. I’m sure the three of us can handle her.”

“We should be able to,” I smiled. She was such a slim, graceful, almost delicate little thing; the thought that three strong men might not be able to control her seemed almost amusing.

“You haven’t seen her in action yet,” said Mercer grimly, glancing up from his work of lengthening the cords that led from the antennae to the control panel. “And what’s more, I hope you don’t.”

I watched him in silence as he spliced and securely taped the last connection.

“All set,” he nodded. “Carson, will you operate the switch for us? I believe everything is functioning properly.” He surveyed the panel of instruments hastily, assuring himself that every reading was correct. Then, with all three of the devices he called antennae in his hand, their leads plugged into the control panel, he led the way to the side of the pool.

The girl was strolling around the edge of the pool, feeling the smooth tile sides with her hands as we came into view, but as soon as she saw us she shot through the water to where we were standing.

It was the first time I had seen her move in this fashion. She seemed to propel herself with a sudden mighty thrust of her feet against the bottom; she

darted through the water with the speed of an arrow, yet stopped as gently as though she had merely floated there.

As she looked up, her eyes unmistakably sought mine, and her smile seemed warm and inviting. She made again that strange little gesture of invitation.

With an effort I glanced at Mercer. There was something devilishly fascinating about the girl's great, dark, searching eyes.

"I'm going in," I said hoarsely. "Hand me one of your head-set things when I reach for it." Before he could protest, I dived into the pool.

I headed directly towards the heavy bronze ladder that led to the bottom of the pool. I had two reasons in mind. I would need something to keep me under water, with my lungs full of air, and I could get out quickly if it were necessary. I had not forgotten the livid, jagged furrows in Mercer's side.

Quickly as I shot to the ladder she was there before

me, a dim, wavering white shape, waiting.

I paused, holding to a rung of the ladder with one hand. She came closer, walking with the airy grace I had noted before, and my heart pounded against my ribs as she raised one long, slim arm towards me.

The hand dropped gently on my shoulder, pressed it as though in token of friendship. Perhaps, I thought quickly, this was, with her, a sign of greeting. I lifted my own arm and returned the salutation, if salutation it were, aware of a strange rising and falling sound, as of a distant humming, in my ears.

The sound ceased suddenly, on a rising note, as though of inquiry, and it dawned on me that I had heard the speech of this strange creature. Before I could think of a course of action, my aching lungs reminded me of the need of air, and I released my hold on the ladder and let my body rise to the surface.

As my head broke the water, a hand, cold and strong as steel, closed around my ankle. I looked down. The girl was watching me, and there was no smile on her

face now.

“All right!” I shouted across the pool to Mercer, who was watching anxiously. Then, filling my lungs with air again, I pulled myself, by means of the ladder, to the bottom of the pool. The restraining hand was removed instantly.

The strange creature thrust her face close to mine as my feet touched bottom, and for the first time I saw her features distinctly.

She was beautiful, but in a weird, unearthly sort of way. As I had already noticed, her eyes were of unusual size, and I saw now that they were an intense shade of blue, with a pupil of extraordinary proportion. Her nose was well shaped, but the nostrils were slightly flattened, and the orifices were rather more elongated than I had ever seen before. The mouth was utterly fascinating, and her teeth, revealed by her engaging smile, were as perfect as it would be possible to imagine.

The great mane of hair which enveloped her was, as I

have said, tawny in hue, and almost translucent, like the stems of some seaweeds I have seen. And as she raised one slim white hand to brush back some wisps that floated by her face, I saw distinctly the webs between her fingers. They were barely noticeable, for they were as transparent as the fins of a fish, but they were there, extending nearly to the last joint of each finger.

As her face came close to my own, I became aware of the humming, crooning sound I had heard before, louder this time. I could see, from the movement of her throat, that I had been correct in assuming that she was attempting to speak with me. I smiled back at her and shook my head. She seemed to understand, for the sound ceased, and she studied me with a little thoughtful frown, as though trying to figure out some other method of communication.

I pointed upward, for I was feeling the need for fresh air again, and slowly mounted the ladder. This time she did not grasp me, but watched me intently, as though understanding what I did, and the reasons for it.

“Bring one of your gadgets over here, Mercer,” I called across the pool. “I think I’m making progress.”

“Good boy!” he cried, and came running with two of the antennae, the long insulated cords trailing behind him. Through the water the girl watched him, evident dislike in her eyes. She glanced at me with sudden suspicion as Mercer handed me the two instruments, but made no hostile move.

“You won’t be able to stay in the water with her,” explained Mercer rapidly. “The salt water would short the antennae, you see. Try to get her to wear one, and then you get your head out of water, and don yours. And remember, she won’t be able to communicate with us by words--we’ll have to get her to convey her thoughts by means of mental pictures. I’ll try to impress that on her. Understand?”

I nodded, and picked up one of the instruments. “Fire when ready, Gridley,” I commented, and sank again to the bottom of the pool.

I touched the girl’s head with one finger, and then

pointed to my own head, trying to convey to her that she could get her thoughts to me. Then I held up the antennae and placed it on my own head to show that it could not harm her.

My next move was to offer her the instrument, moving slowly, and smiling reassuringly--no mean feat under water.

She hesitated a moment, and then, her eyes fixed on mine, she slowly fixed the instrument over her own head as she had seen me adjust it upon my own.

I smiled and nodded, and pressed her shoulder in token of friendly greeting. Then, gesturing toward my own head again, and pointing upward. I climbed the ladder.

"All right, Mercer," I shouted. "Start at once, before she grows restless!"

"I've already started!" he called back, and I hurriedly donned my own instrument.

Bearing in mind what Mercer had said, I descended the ladder but a few rungs, so that my head remained out of water, and smiled down at the girl, touching the instrument on my head, and then pointing to hers.

I could sense Mercer's thoughts now. He was picturing himself walking long the shore, with the stormy ocean in the background. Ahead of him I saw the white body lying face downward in the pool. I saw him run up to the pool and lift the slim, pale figure in his arms.

Let me make it clear, at this point, that when I say that I saw these things, I mean only that mental images of them penetrated my consciousness. I visualized them just as I could close my eyes and visualize, for example, the fireplace in the living room of my own home.

I looked down at the girl. She was frowning, and her eyes were very wide. Her head was a little on one side, in the attitude of one who listens intently.

[Image description start: A black and white illustration showing Mercer's large swimming pool, with a view from the far side. Taylor stands up to his waist in the water on the ladder, Mercer sits on a chair further back on the concrete, and the mermaid stands in the bottom of the pool, her hair dark around

her, tilting her head slightly to the side. Each of them is wearing a headset with a long wire leading to a machine coming from an open window behind Mercer.

End image description.]

Slowly and carefully Mercer thought out the whole story of his experiences with the girl until she had plunged into the pool. Then I saw again the beach, with the girl's figure in the pool. The picture grew hazy; I realized Mercer was trying to picture the bottom of the sea. Then he pictured again the girl lying in the pool, and once again the sea. I was aware of the soft little tick in the center of my brain that announced that the switch had been moved to another contact point.

I glanced down at her. She was staring up at me with her great, curious eyes, and I sensed, through the medium of the instrument I wore, that she was thinking of me. I saw my own features, idealized, glowing with a strange beauty that was certainly none of my own. I realized that I saw myself, in short, as she saw me. I smiled back at her, and shook my head.

A strange, dim whirl of pictures swept through my consciousness. I was on the bottom of the ocean. Shadowy shapes swept by silently, and from above, a dim bluish light filtered down on a scene such as mortal eyes have never seen.

All around were strange structures of jagged coral, roughly circular as to base, and rounded on top, resembling very much the igloos of the Eskimos. The structures varied greatly in size, and seemed to be arranged in some sort of regular order, like houses along a narrow street. Around many of them grew clusters of strange and colorful seaweeds that waved their banners gently, as though some imperceptible current dallied with them in passing.

Here and there figures moved, slim white figures that strolled along the narrow street, or at times shot overhead like veritable torpedoes.

There were both men and women moving there. The men were broader of shoulder, and their hair, which they wore to their knees, was somewhat darker in color than that of the women. Both sexes were slim,

and there was a remarkable uniformity of size and appearance.

None of the strange beings wore garments of any kind, nor were they necessary. The clinging tresses were cinctured at the waist with a sort of cord of twisted orange-colored material, and some of the younger women wore bands of the same material around their brows.

Nearest of all the figures was the girl who was visualizing all this for us. She was walking slowly away from the cluster of coral structures. Once or twice she paused, and seemed to hold conversation with others of the strange people, but each time she moved on.

The coral structures grew smaller and poorer. Finally the girl trod alone on the floor of the ocean, between great growths of kelp and seaweeds, with dim, looming masses of faintly tinted coral everywhere. Once she passed close to a tilted, ragged hulk of some ancient vessel, its naked ribs packed with drifted sand.

Sauntering dreamily, she moved away from the ancient derelict. Suddenly a dim shadow swept across the sand at her feet, and she arrowed from the spot like a white, slim meteor. But behind her darted a black and swifter shadow--a shark!

Like a flash she turned and faced the monster. Something she had drawn from her girdle shone palely in her hand. It was a knife of whetted stone or bone.

Darting swiftly downward her feet spurned the yellow sand, and she shot at her enemy with amazing speed. The long blade swept in an arc, ripped the pale belly of the monster just as he turned to dart away.

A great cloud of blood dyed the water. The white figure of the girl shot onward through the scarlet flood.

Blinded, she did not see that the jutting ribs of the ancient ship were in her path. I seemed to see her crash, head on, into one of the massive timbers, and I cried out involuntarily, and glanced down at the girl in

the water at my feet.

Her eyes were glowing. She knew that I had understood.

Hazily, then, I seemed to visualize her body floating limply in the water. It was all very vague and indistinct, and I understood that this was not what she had seen, but what she thought had happened. The impressions grew wilder, swirled, grew gray and indistinct. Then I had a view of Mercer's face, so terribly distorted it was barely recognizable. Then a kaleidoscopic maze of inchoate scenes, shot through with flashes of vivid, agonizing colors. The girl was thinking of her suffering, taken out of her native element. In trying to save her, Mercer had almost killed her. That, no doubt, was why she hated him.

My own face appeared next, almost godlike in its kindliness and its imagined beauty, and I noticed now that she was thinking of me with my yellow hair grown long, my nostrils elongated like her own--adjusted to her own ideas of what a man should be.

I flung the instrument from my head and dropped to the bottom of the pool. I gripped both her shoulders, gently, to express my thanks and friendship.

My heart was pounding. There was a strange fascination about this girl from the depths of the sea, a subtle appeal that was answered from some deep subterranean cavern of my being. I forgot, for the moment, who and what I was. I remembered only that a note had been sounded that awoke an echo of a long-forgotten instinct.

I think I kissed her. I know her arms were about me, and that I pressed her close, so that our faces almost met. Her great, weirdly blue eyes seemed to bore into my brain. I could feel them throbbing there....

I forgot time and space. I saw only that pale, smiling face and those great dark eyes. Then, strangling, I tore myself from her embrace and shot to the surface.

Coughing, I cleared my lungs of the water I had inhaled. I was weak and shaking when I finished, but my head was clear. The grip of the strange fantasy

that had gripped me was shaken off.

Mercer was bending over me; speaking softly.

“I was watching, old man,” he said gently. “I can imagine what happened. A momentary, psychic fusing of an ancient, long since broken link. You, together with all mankind, came up out of the sea. But there is no retracing the way.”

I nodded, my head bowed on my streaming chest.

“Sorry, Mercer,” I muttered. “Something got into me. Those big eyes of hers seemed to tug at threads of memory ... buried.... I can’t describe it....”

He slapped me on my naked shoulder, a blow that stung, as he had intended it to. It helped jerk me back to the normal.

“You’ve got your feet on the ground again, Taylor,” he commented soothingly. “I think there’s no danger of you losing your grip on terra firma again. Shall we carry on?”

“There’s more you’d like to learn? That you think she can give us?” I asked hesitantly.

“I believe,” replied Mercer, “that she can give us the history of her people, if we can only make her understand what we wish. God! If we only could!” The name of the Deity was a prayer as Mercer uttered it.

“We can try, old-timer,” I said, a bit shakenly.

Mercer hurried back to the other side of the pool, and I adjusted my head-set again, smiling down at the girl. If only Mercer could make her understand, and if only she knew what we wanted to learn!

I was conscious of the little click that told me the switch had been moved. Mercer was ready to get his message to her.

Fixing my eyes on the girl pleadingly, I settled myself by the edge of the pool to await the second and more momentous part of our experiment.

The vision was vague, for Mercer was picturing his

thoughts with difficulty. But I seemed to see again the floor of the ocean, with the vague light filtering down from above, and soft, monstrous growths waving their branches lazily in the flood.

From the left came a band of men and women, looking around as though in search of some particular spot. They stopped, and one of the older men pointed, the others gathering around him as though in council.

Then the band set to work. Coral growth were dragged to the spot. The foundation for one of the semi-circular houses was laid. The scene swirled and cleared again. The house was completed. Several other houses were in process of building.

Slowly and deliberately, the scene moved. The houses were left behind. Before my consciousness now was only a vague and shadowy expanse of ocean floor, and in the sand dim imprints that marked where the strange people had trod, the vague footprints disappearing in the gloom in the direction from which the little weary band had come. To me, at least, it was quite clear that Mercer was asking whence they

came. Would it be as clear to the girl? The switch clicked, and for a moment I was sure Mercer had not been able to make his question clear to her.

The scene was the interior of one of the coral houses. There were persons there, seated on stone or coral chairs, padded with marine growths. One of the occupants of the room was a very old man; his face was wrinkled, and his hair was silvery. With him were a man and a woman, and a little girl. Somehow I seemed to recognize the child as the girl in the pool.

The three of them were watching the old man. While his lips did not move, I could see his throat muscles twitching as the girl's had done when she made the murmuring sound I had guessed was her form of speech.

The scene faded. For perhaps thirty seconds I was aware of nothing more than a dim gray mist that seemed to swirl in stately circles. Then, gradually, it cleared somewhat. I sensed the fact that what I saw now was what the old man was telling, and that the majestic, swirling mist was the turning back of time.

Here was no ocean bottom, but land, rich tropical jungle. Strange exotic trees and dense growths of rank undergrowth choked the earth. The trees were oddly like undersea growths, which puzzled me for an instant. Then I recalled that the girl could interpret the old man's words only in terms of that which she had seen and understood. This was the way she visualized the scene.

There was a gray haze of mist everywhere. The leaves were glistening with condensed moisture; swift drops fell incessantly to the soaking ground below.

Into the scene roamed a pitiful band of people. Men with massive frames, sunken in with starvation, women tottering with weakness. The men carried great clubs, some tipped with rudely shaped stone heads, and both men and women clothed only in short kittles of skin.

They searched ceaselessly for something, and I guessed that something was food. Now and then one or the other of the little band tore up a root and bit at it, and those that did so soon doubled into a twitching

knot of suffering and dropped behind.

At last they came to the edge of the sea. A few yards away the water was lost in the dense steaming miasma that hemmed them in on all sides. With glad expressions on their faces, the party ran down to the edge of the water and gathered up great masses of clams and crabs. At first they ate the food raw, tearing the flesh from the shells. Then they made what I understood was a fire, although the girl was able to visualize it only as a bright red spot that flickered.

The scene faded, and there was only the slowly swirling mist that I understood indicated the passing of centuries. Then the scene cleared again.

I saw that same shore line, but the people had vanished. There was only the thick, steamy mist, the tropic jungle crowding down to the shore, and the waves rolling in monotonously from the waste of gray ocean beyond the curtain of fog.

Suddenly, from out of the sea, appeared a series of

human heads, and then a band of men and women that waded ashore and seated themselves upon the beach, gazing restlessly out across the sea.

This was not the same band I had seen at first. These were a slimmer race, and whereas the first band had been exceedingly swarthy, these were very fair.

They did not stay long on shore, for they were restless and ill at ease. It seemed to me they came there only from force of habit, as though they obeyed some inner urge they did not understand. In a few seconds they rose and ran into the water, plunged into it as though they welcomed its embrace, and disappeared. Then again the vision was swallowed up by the swirling mists of time.

When the scene cleared again, it showed the bottom of the sea. A group of perhaps a hundred pale creatures moved along the dim floor of the ocean. Ahead I could see the dim outlines of one of their strange cities. The band approached, seemed to talk with those there, and moved on.

I saw them capture and kill fish for food, saw them carve the thick, spongy hearts from certain giant growths and eat them. I saw a pair of killer sharks swoop down on the band, and the quick, deadly accuracy with which both men and woman met the attack. One man, older than the rest, was injured before the sharks were vanquished, and when their efforts to staunch his wounds proved unavailing, they left him there and moved on. And as they left I saw a dim, crawling shape move closer, throw out a long, whiplike tentacle, and wrap the body in a hungry embrace.

They came to and passed other communities of beings like themselves, and a city of their own, in much the way that Mercer had visualized it.

Fading, the scene changed to the interior of the coral house again. The old man finished his story, and moved off into a cubicle in the rear of the place. Dimly, I could see there a low couch, piled high with soft marine growths. Then the scene shifted once more.

A man and a woman hurried up and down the narrow streets of the strange city the girl had pictured when she showed us how she had met with the shark, and struck her head, so that for a long period she lost consciousness and was washed ashore.

Others, after a time, joined them in their search, which spread out to the floor of the ocean, away from the dwellings. One party came to the gaunt skeleton of the ancient wreck, and found the scattered, fresh-picked bones of the shark the girl had killed. The man and the woman came up, and I looked closely into their faces. The woman's features were torn with grief; the man's lips were set tight with suffering. Here, it was easy to guess, were the mother and the father of the girl.

A milling mass of white forms shot through the water in every direction, searching. It seemed that they were about to give up the search when suddenly, from out of the watery gloom, there shot a slim white figure--the girl!

Straight to the mother and father she came, gripping

the shoulder of each with frantic joy. They returned the caress, the crowd gathered around them, listening to her story as they moved slowly, happily, towards the distant city.

Instead of a picture, I was conscious then of a sound, like a single pleading word repeated softly, as though someone said "Please! Please! Please!" over and over again. The sound was not at all like the English word. It was a soft, musical beat, like the distant stroke of a mellow gong, but it had all the pleading quality of the word it seemed to bring to mind.

I looked down into the pool. The girl had mounted the ladder until her face was just below the surface of the water. Her eyes met mine and I knew that I had not misunderstood.

I threw off the instrument on my head, and dropped down beside her. With both hands I grasped her shoulders, and, smiling, I nodded my head vigorously.

She understood, I know she did. I read it in her face. When I climbed the ladder again, she looked after me,

smiling confidently.

Although I had not spoken to her, she had read and accepted the promise.

Mercer stared at me silently, grimly, as I told him what I wished. Whatever eloquence I may have, I used on him, and I saw his cold, scientific mind waver before the warmth of my appeal.

“We have no right to keep her from her people,” I concluded. “You saw her mother and father, saw their suffering, and the joy her return would bring. You will, Mercer--you will return her to the sea?”

For a long time, Mercer did not reply. Then he lifted his dark eyes to mine, and smiled, rather wearily.

“It is the only thing we can do, Taylor,” he said quietly. “She is not a scientific specimen; she is, in her way, as human as you or I. She would probably die, away from her own kind, living under conditions foreign to her. And you promised her, Taylor, whether you spoke your promise or not.” His smile deepened a

bit. "We cannot let her receive too bad an opinion of her cousins who live above the surface of the sea!"

And so, just as the dawn was breaking, we took her to the shore. I carried her, unresisting, trustful, in my arms, while Mercer bore a huge basin of water, in which her head was submerged, so that she might not suffer.

Still in our bathing suits we waded out into the ocean, until the waves splashed against our faces. Then I lowered her into the sea. Crouching there, so that the water was just above the tawny glory of her hair, she gazed up at us. Two slim white hands reached towards us, and with one accord, Mercer and I bent towards her. She gripped both our shoulders with a gentle pressure, smiling at us.

Then she did a strange thing. She pointed, under the water, out towards the depths and with a broad, sweeping motion of her arm, indicated the shore, as though to say that she intended to return. With a last swift, smiling glance up into my face, she turned. There was a flash of white through the water. She was

gone....

Silently, through the silence and beauty of the dawn, we made our way back to the house.

As we passed through the laboratory, Mercer glanced out at the empty pool.

“Man came up from the sea,” he said slowly, “and some men went back to it. They were forced back to the teeming source from whence they came, for lack of food. You saw that, Taylor--saw her forebears become amphibians, like the now extinct *Dipneusta* and *Ganoideii*, or the still existing *Neoceratodus*, *Polypterus* and *Amia*. Then their lungs became, in effect, gills, and they lost their power of breathing atmospheric air, and could use only air dissolved in water.

“A whole people there beneath the waves that land-man never dreamed of--except, perhaps, the sailors of olden days, with their tales of mermaids, which we are accustomed to laugh at in our wisdom!”

“But why were no bodies ever washed ashore?” I asked. “I would think--”

“You saw why,” interrupted Mercer grimly. “The ocean teems with hungry life. Death is the signal for a feast. It was little more than a miracle that her body came ashore, a miracle due perhaps to the storm which sent the hungry monsters to the greater depths. And even had a body come ashore it would have been buried as that of some unknown, unfortunate human. The differences between these people and ourselves would not be noticeable to a casual observer.

“No, Taylor, we have been party to what was close to a miracle. And we are the only witnesses to it, you and Carson and myself. And”--he sighed deeply--“it is over.”

I did not reply. I was thinking of the girl’s odd gesture, at parting, and I wondered if it were indeed a finished chapter.

Into the Ocean's Depths

I read the telegram for the second time. Then I folded it up, put it in my pocket, and pressed the little button on my desk. My mind was made up.

To save Imee's race of Men-Who-Returned-To-The-Sea, two Land-Men answer the challenge of the dreaded Rorn, corsairs of the under-seas.

"Miss Fentress, I'm leaving this afternoon on an extended trip. The Florida address will reach me after Thursday. Tell Wade and Bennett to carry on. I think you have everything in hand? Is everything clear to you?"

"Yes, Mr. Taylor." Miss Fentress was not in the least surprised. She was used to my sudden trips. The outfit got along perfectly without me; sometimes I think my frequent absences are good for the business. The boys work like the devil to make a fine showing while I'm away. And Miss Fentress is a perfect gem of a secretary. I had nothing to worry about there.

"Fine! Will you get my diggings on the phone?" I hurriedly put my few papers in place, and signed a couple of letters. Then Josef was on the wire.

"Josef? Pack my bags right away, will you? For Florida. The usual things.... Yes, right away. I'll be leaving by noon.... Yes, driving through."

That was that. There were a few more letters to sign, a few hasty instructions to be given regarding one or two matters that were hanging fire. Then, on my way to my bachelor apartments, I read the telegram through again:

THINK IT WORTH WHILE IF YOU FEEL
ADVENTUROUS AND HAVE NOTHING PRESSING
TO COME TO THE MONSTROSITY STOP MAKE
YOUR WILL FIRST STOP SHALL LOOK FOR YOU
ANY DAY AS I KNOW YOU ARE ALWAYS LOOKING
FOR EXCITEMENT AND NEVER HAVE ANYTHING
IMPORTANT TO DO SO DON'T BOTHER TO WIRE
STOP PERHAPS WE SHALL SEE HER AGAIN

MERCER

[Plain text: Think it worth while if you feel adventurous and have nothing pressing to come to The Monstrosity. Make your will first. Shall look for you any day as I know you are always looking for excitement and never have anything important to do so don't bother to wire. Perhaps we shall see her again -Mercer. End plain text.]

I smiled at Mercer's frank opinion of my disposition and my importance to my business. But I frowned over the admonition to make my will, and the last telling statement in the wire: "Perhaps we shall see her again." I knew whom he meant by "her."

Josef had my bags waiting for me. A few hurried instructions, most of them shouted over my shoulder, and I was purring down the main drag, my duffel in the rumble, and the roadster headed due south.

"Perhaps we shall see her again." Those words from the telegram kept coming before my eyes. Mercer knew what he was about, if he wanted my company, when he put that line in his wire.

I have already told the story of our first meeting with the strange being from the ocean's depths that, wounded and senseless, had been flung up on the beach near Warren Mercer's Florida estate. In all the history of civilization, no stranger bit of flotsam had ever been cast up by a storm.

Neither of us would ever forget that slim white creature, swathed in her veil of long, light golden hair, as she crouched on the bottom of Mercer's swimming pool, and pictured for us, by means of Mercer's thought-telegraph (my own name for the device; he has a long and scientific title for it with as many joints as a centipede), the story of her people.

They had lived in a country of steaming mist, when the world was very young. They had been forced into the sea to obtain food, and after many generations they had gone back to the sea as man once emerged from it. They had grown webs on their hands and feet, and they breathed oxygen dissolved in water, as fishes do, instead of taking it from the atmosphere. And under the mighty Atlantic, somewhere, were their villages.

The girl had pictured all these things for us, and then—nearly a year ago, now—she had pleaded with us to let her return to her people. And so we had put her back into the sea, and she had bade us farewell. But just before she disappeared, she had done a strange thing.

She had pointed, under the water, out towards the depth, and then, with a broad, sweeping motion of her arm, she had indicated the shore, as though to promise, it seemed to me, that she intended to return.

And now, Mercer said, we might see her again! How? Mercer, conservative and scientific, was not the man to make rash promises. But how...?

The best way to solve the riddle was to reach Mercer, and I broke the speed laws of five states three days running.

I did not even stop at my own little shack. It was only four miles from there to the huge, rather neglected estate, built in boom times by some newly-rich promoter, and dubbed by Mercer "The Monstrosity."

Hardly bothering to slow down, I turned off the concrete onto the long, weed-grown gravel drive, and shot between the two massive, stuccoed pillars that guarded the drive. Their corroded bronze plates, bearing the original title of the estate, "The Billows," were a promise that my long, hard drive was nearly at an end.

As soon as the huge, rambling structure was fairly in sight, I pressed the flat of my hand on the horn button. By the time I came to a locked-wheel halt, with the gravel rattling on my fenders, Mercer was there to greet me.

"It's ten o'clock," he grinned as he shook hands. "I'd set noon as the hour of your arrival. You certainly must have made time, Taylor!"

"I did!" I nodded rather grimly, recalling one or two narrow squeaks. "But who wouldn't, with a wire like this?" I produced the crumpled telegram rather dramatically. "You've got a lot to explain."

"I know it." Mercer was quite serious now. "Come on

in and we'll mix highballs with the story."

Locked arm in arm, we entered the house together, and settled ourselves in the huge living room.

Mercer, I could see at a glance, was thinner and browner than when we had parted, but otherwise, he was the same lithe, soft-mannered little scientist I had known for years; dark-eyed, with an almost beautiful mouth, outlined by a slim, closely cropped and very black moustache.

"Well, here's to our lady from the sea," proposed Mercer, when Carson, his man, had brought the drinks and departed. I nodded, and we both sipped our highballs.

"Briefly," said my friend, "this is the story. You and I know that somewhere beneath the Atlantic there are a people who went back to whence they came. We have seen one of those people. I propose that, since they cannot come to us, we go to them. I have made preparations to go to them, and I wanted you to have the opportunity of going with me, if you wish."

"But how, Mercer? And what—"

He interrupted with a quick, nervous gesture.

"I'll show you, presently. I believe it can be done. It will be a dangerous adventure, though; I was not joking when I advised you to make your will. An uncertain venture, too. But, I believe, most wonderfully worth while." His eyes were shining now with all the enthusiasm of the scientist, the dreamer.

"It sounds mighty appealing," I said. "But how...."

"Finish your drink and I'll show you."

I downed what was left of my highball in two mighty gulps.

"Lead me to it, Mercer!"

He smiled his quiet smile and led the way to what had been the billiard room of "The Billows," but which was the laboratory of "The Monstrosity." The first thing my eyes fell upon were two gleaming metal objects

suspended from chains let into the ceiling.

"Diving suits," explained Mercer. "Rather different from anything you've ever seen."

They were different. The body was a perfect globe, as was the head-piece. The legs were cylindrical, jointed at knee and thigh with huge discs. The feet were solid metal, curved rocker-like on the bottom, and at the ends of the arms were three hooked talons, the concave sides of two talons facing the concave side of the third. The arms were hinged at the elbow just as the legs were hinged, but there was a huge ball-and-socket joint at the shoulder.

"But Mercer!" I protested. "No human being could even stand up with that weight of metal on and around him!"

"You're mistaken, Taylor," smiled Mercer. "That is not solid metal, you see. And it is an aluminum alloy that is not nearly as heavy as it looks. There are two walls, slightly over an inch apart, braced by innumerable trusses. The fabric is nearly as strong as that much

solid metal, and infinitely lighter. They work all right, Taylor. I know, because I've tried them."

"And this hump on the back?" I asked, walking around the odd, dangling figures, hanging like bloated metal skeletons from their chains. I had thought the bodies were perfect globes; I could see now that at the rear there was a humplike excrescence across the shoulders.

"Air," explained Mercer. "There are two other tanks inside the globular body. That shape was adopted, by the way, because a globe can withstand more pressure than any other shape. And we may have to go where pressures are high."

"And so," I said, "we don these things and stroll out into the Atlantic looking for the girl and her friends?"

"Hardly. They're not quite the apparel for so long a stroll. You haven't seen all the marvels yet. Come along!"

He led the way through the patio, beside the pool in

which our strange visitor from the depths had lived during her brief stay with us, and out into the open again. As we neared the sea, I became aware, for the first time, of a faint, muffled hammering sound, and I glanced at Mercer inquiringly.

"Just a second," he smiled. "Then—there she is, Taylor!"

I stood still and stared. In a little cove, cradled in a cunning, spidery structure of wood, a submarine rested upon the ways.

"Good Lord!" I exclaimed. "You're going into this right, Mercer!"

"Yes. Because I think it's immensely worth while. But come along and let me show you the *Santa Maria*—named after the flagship of Columbus' little fleet. Come on!"

Two men with army automatics strapped significantly to their belts nodded courteously as we came up. They were the only men in sight, but from the

hammering going on inside there must have been quite a sizeable crew busy in the interior. A couple of raw pine shacks, some little distance away, provided quarters for, I judged, twenty or thirty men.

"Had her shipped down in pieces," explained Mercer. "The boat that brought it lay to off shore and we lightered the parts ashore. A tremendous job. But she'll be ready for the water in a week; ten days at the latest."

"You're a wonder," I said, and I meant it.

Mercer patted the red-leaded side of the submarine affectionately. "Later," he said, "I'll take you inside, but they're busy as the devil in there, and the sound of the hammers fairly makes your head ring. You'll see it all later, anyway—if you feel you'd like to share the adventure with me?"

"Listen," I grinned as we turned back towards the house, "it'll take more than those two lads with the pop-guns to keep me out of the *Santa Maria* when she sails—or dives, or whatever it is she's supposed to

do!"

Mercer laughed softly, and we walked the rest of the way in silence. I imagine we were both pretty busy with our thoughts; I know that I was. And several times, as we walked along, I looked back over my shoulder towards the ungainly red monster straddling on her spindling wooden legs—and towards the smiling Atlantic, glistening serenely in the sun.

Mercer was so busy with a thousand and one details that I found myself very much in the way if I followed him around, so I decided to loaf.

For weeks after we had put our strange girl visitor back into the sea from whence Mercer had taken her, I had watched from a comfortable seat well above the high-water mark that commanded that section of shore. For I had felt sure by that last strange gesture of hers that she meant to return.

I located my old seat, and I found that it had been used a great deal since I had left it. There were whole winnows of cigarette butts, some of them quite fresh,

all around. Mercer, cold-blooded scientist as he was, had hoped against hope that she would return too.

It was a very comfortable seat, in the shade of a little cluster of palms, and for the next several days I spent most of my time there, reading and smoking—and watching. No matter how interesting the book, I found myself, every few seconds, lifting my eyes to search the beach and the sea.

I am not sure, but I think it was the eighth day after my arrival that I looked up and saw, for the first time, something besides the smiling beach and the ceaseless procession of incoming rollers. For an instant I doubted what I saw; then, with a cry that stuck in my throat, I dropped my book unheeded to the sand and raced towards the shore.

She was there! White and slim, her pale gold hair clinging to her body and gleaming like polished metal in the sun, she stood for a moment, while the spray frothed at her thighs. Behind her, crouching below the surface, I could distinguish two other forms. She had returned, and not alone!

One long, slim arm shot out toward me, held level with the shoulder: the well-remembered gesture of greeting. Then she too crouched below the surface that she might breathe.

As I ran out onto the wet sand, the waves splashing around my ankles all unheeded, she rose again, and now I could see her lovely smile, and her dark, glowing eyes. I was babbling—I do not know what. Before I could reach her, she smiled and sank again below the surface.

I waded on out, laughing excitedly, and as I came close to her, she bobbed up again out of the spray, and we greeted each other in the manner of her people, hands outstretched, each gripping the shoulder of the other.

She made a quick motion then, with both hands, as though she placed a cap upon the shining glory of her head, and I understood in an instant what she wished: the antenna of Mercer's thought-telegraph, by the aid of which she had told us the story of herself and her people.

I nodded and smiled, and pointed to the spot where she stood, trying to show her by my expression that I understood, and by my gesture, that she was to wait here for me. She smiled and nodded in return, and crouched again below the surface of the heaving sea.

As I turned toward the beach, I caught a momentary glimpse of the two who had come with her. They were a man and a woman, watching me with wide, half-curious, half-frightened eyes. I recognized them instantly from the picture she had impressed upon my mind nearly a year ago. She had brought with her on her journey her mother and her father.

Stumbling, my legs shaking with excitement, I ran through the water. With my wet trousers flapping against my ankles, I sprinted towards the house.

I found Mercer in the laboratory. He looked up as I came rushing in, wet from the shoulders down, and I saw his eyes grow suddenly wide.

I opened my mouth to speak, but I was breathless. And Mercer took the words from my mouth before I

could utter them.

"She's come back!" he cried. "She's come back! Taylor—she has?" He gripped me, his fingers like steel clamps, shaking me with his amazing strength.

"Yes." I found my breath and my voice at the same instant. "She's there, just where we put her into the sea, and there are two others with her—her mother and her father. Come on, Mercer, and bring your thought gadget!"

"I can't!" he groaned. "I've built an improvement on it into the diving armor, and a central instrument on the sub, but the old apparatus is strewn all over the table, here, just as it was when we used it the other time. We'll have to bring her here."

"Get a basin, then!" I said. "We'll carry her back to the pool just as we took her from it. Hurry!"

And we did just that. Mercer snatched up a huge glass basin used in his chemistry experiments, and we raced down to the shore. As well as we could we

explained our wishes, and she smiled her quick smile of understanding. Crouching beneath the water, she turned to her companions, and I could see her throat move as she spoke to them. They seemed to protest, dubious and frightened, but in the end she seemed to reassure them, and we picked her up, swathed in her hair as in a silken gown, and carried her, her head immersed in the basin of water, that she might breathe in comfort, to the pool.

It all took but a few minutes, but it seemed hours. Mercer's hands were shaking as he handed me the antenna for the girl and another for myself, and his teeth were chattering as he spoke.

"Hurry, Taylor!" he said. "I've set the switch so that she can do the sending, while we receive. Quickly, man!"

I leaped into the pool and adjusted the antenna on her head, making sure that the four electrodes of the crossed curved members pressed against the front and back and both sides of her head. Then, hastily, I climbed out of the pool, seated myself on its edge,

and put on my own antenna.

Perhaps I should say at this time that Mercer's device for conveying thought could do no more than convey what was in the mind of the person sending. Mercer and I could convey actual words and sentences, because we understood each other's language, and by thinking in words, we conveyed our thoughts in words. One received the impression, almost, of having heard actual speech.

We could not communicate with the girl in this fashion, however, for we did not understand her speech. She had to convey her thoughts to us by means of mental pictures which told her story. And this is the story of her pictures unfolded.

First, in sketchy, half-formed pictures, I saw her return to the village, of her people; her welcome there, with curious crowds around her, questioning her. Their incredulous expressions as she told them of her experience were ludicrous. Her meeting with her father and mother brought a little catch to my throat, and I looked across the pool at Mercer. I knew that

he, too, was glad that we had put her back into the sea when she wished to go.

These pictures faded hastily, and for a moment there was only the circular swirling as of gray mist; that was the symbol she adopted to denote the passing of time. Then, slowly, the picture cleared.

It was the same village I had seen before, with its ragged, warped, narrow streets, and its row of dome-shaped houses, for all the world like Eskimo igloos, but made of coral and various forms of vegetation. At the outskirts of the village I could see the gently moving, shadowy forms of weird submarine growths, and the quick darting shapes of innumerable fishes.

Some few people were moving along the streets, walking with oddly springy steps. Others, a larger number, darted here and there above the roofs, some hovering in the water as gulls hover in the air, lazily, but the majority apparently on business or work to be executed with dispatch.

Suddenly, into the midst of this peaceful scene, three

figures came darting. They were not like the people of the village, for they were smaller, and instead of being gracefully slim they were short and powerful in build. They were not white like the people of the girl's village, but swarthy, and they were dressed in a sort of tight-fitting shirt of gleaming leather—shark-skin, I learned later. They carried, tucked through a sort of belt made of twisted vegetation, two long, slim knives of pointed stone or bone.

But it was not until they seemed to come close to me that I saw the great point of difference. Their faces were scarcely human. The nose had become rudimentary, leaving a large, blank expanse in the middle of their faces that gave them a peculiarly hideous expression. Their eyes were almost perfectly round, and very fierce, and their mouths huge and fishlike. Beneath their sharp, jutting jaws, between the angle of the jaws and a spot beneath the ears, were huge, longitudinal slits, that intermittently showed blood-red, like fresh gashes cut in the sides of their throats. I could see even the hard, bony cover that protected these slits, and I realized that these

were gills! Here were representatives of a people that had gone back to the sea ages before the people of the girl's village.

Their coming caused a sort of panic in the village, and the three noseless creatures strode down the principal street grinning hugely, glancing from right to left, and showing their sharp pointed teeth. They looked more like sharks than like human beings.

A committee of five gray old men met the visitors, and conducted them into one of the larger houses. Insolently, the leader of the three shark-faced creatures made demands, and the scene changed swiftly to make clear the nature of those demands.

The village was to give a number of its finest young men and women to the shark-faced people; about fifty of each sex, I gathered, to be servants, slaves, to the noseless ones.

The scene shifted quickly to the interior of the house. The old men were shaking their heads, protesting, explaining. There was fear on their faces, but there

was determination, too.

One of the three envoys snarled and came closer to the five old men, lifting a knife threateningly. I thought for an instant that he was about to strike down one of the villagers; then the picture dissolved into another, and I saw that he was but threatening them with what he could cause to happen.

The fate of the village and the villagers, were the demands of the three refused, was a terrible one. Hordes of the noseless creatures came swarming. They tore the houses apart, and with their long, slim white weapons they killed the old men and women, and the children. The villagers fought desperately, but they were outnumbered. The shark-skin kirtles of the invaders turned their knives like armor, and the sea grew red with swirling blood that spread like scarlet smoke through the water. Then, this too faded, and I saw the old men cowering, pleading with the three terrible envoys.

The leader of the three shark-faced creatures spoke again. He would give them time—a short revolving

swirl of gray that indicated only a brief time, apparently—and return for an answer. Grinning evilly, the three turned away, left the dome-shaped house, and darted away over the roofs of the village into the dim darkness of the distant waters.

I saw the girl, then, talking to the elders. They smiled sadly, and shook their heads hopelessly. She argued with them earnestly, painting a picture for them: Mercer and myself, as she viewed us, tall and very strong and with great wisdom in our faces. We too walked along the streets of the village. The hordes of shark-faced ones came, like a swarm of monstrous sharks, and—the picture was very vague and nebulous, now—we put them to rout.

She wished us to help her, she had convinced the elders that we could. She, her mother and father, started out from the village. Three times they had fought with sharks, and each time they had killed them. They had found the shore, the very spot where we had put her back into the sea. Then there was a momentary flash of the picture she had called up, of Mercer and I putting the shark-faced hordes to rout,

and then, startlingly, I was conscious of that high, pleading sound—the sound that I had heard once before, when she had begged us to return her to her people.

The sound that I knew was her word for "*Please!*"

There was a little click. Mercer had turned the switch. He would transmit now; she and I would listen.

In the center of the village—how vaguely and clumsily he pictured it!—rested the *Santa Maria*. From a trap in the bottom two bulging, gleaming figures emerged. Rushing up, a glimpse through the face-plates revealed Mercer and myself. The shark-faced hordes descended, and Mercer waved something, something like a huge bottle, towards them. None of the villagers were in sight.

The noseless ones swooped down on us fearlessly, knives drawn, pointed teeth revealed in fiendish grins. But they did not reach us. By dozens, by scores, they went limp and floated slowly to the floor of the ocean. Their bodies covered the streets, they

sprawled across the roofs of the houses. And in a few seconds there was not one alive of all the hundreds who had come!

I looked down at the girl. She was smiling up at me through the clear water, and once again I felt the strange, strong tug at my heart-strings. Her great dark eyes glowed with a perfect confidence, a supreme faith.

We had made her a promise.

I wondered if it would be possible to keep it.

In the day following, the *Santa Maria* was launched. Two days later, trial trips and final adjustments completed, we submerged for the great adventure.

It sounds very simple when recorded thus in a few brief lines. It was not, however, such a simple matter. Those three days were full of hectic activity. Mercer and I did not sleep more than four hours any of those three nights.

We were too busy to talk. Mercer worked frantically in his laboratory, slaving feverishly beside the big hood. I overlooked the tests of the submarine and the loading of the necessary supplies.

The girl we had taken back to her parents, giving her to understand that she was to wait. They went away, but every few hours returned, as though to urge us to greater haste. And at last we were ready, and the girl and her two companions seated themselves on the tiny deck of the *Santa Maria*, just forward of the conning tower, holding themselves in place by the chains. We had already instructed the girl in her duties: we would move slowly, and she should guide us, by pointing either to the right or the left.

I will confess I gave a last long, lingering look at the shore before the hatch of the conning tower was clamped down. I was not exactly afraid, but I wondered if I would ever step foot on solid land again.

Standing in the conning tower beside Mercer, I watched the sea rise at an angle to meet us, and I dodged instinctively as the first green wave pelted

against the thick porthole through which I was looking. An instant later the water closed over the top of the conning tower, and at a gentle angle we nosed towards the bottom of the sea.

An account of the trip itself, perhaps, does not belong in this record. It was not a pleasant adventure in itself, for the *Santa Maria*, like every undersea craft, I suppose, was close, smelly, and cramped. We proceeded very slowly, for only by so doing could our guide keep her bearings, and how she found the way was a mystery to all of us. We could see but very little, despite the clearness of the water.

It was by no means a sight-seeing trip. For various reasons, Mercer had cut our crew to the minimum. We had two navigating officers, experienced submarine men both, and five sailors, also experienced in undersea work. With such a short crew, Mercer and I were both kept busy.

Bonnett, the captain, was a tall, dark chap, stooped from years in the low, cramped quarters of submarines. Duke, our second-officer, was a

youngster hardly out of his 'teens, and as clever as they come. And although both of them, and the crew as well, must have been agog with questions, neither by word nor look did they express their feelings. Mercer had paid for obedience without curiosity, and he got it.

We spent the first night on the bottom, for the simple reason that had we come to the surface, we might have come down into territory unfamiliar to our guide. As soon as the first faint light began to filter down, however, we proceeded, and Mercer and I crowded together into the conning tower.

"We're close," said Mercer. "See how excited they are, all three of them."

The three strange creatures were holding onto the chains and staring over the bulging side of the ship. Every few seconds the girl turned and looked back at us, smiling, her eyes shining with excitement. Suddenly she pointed straight down, and held out her arm in unmistakable gesture. We were to stop.

Mercer conveyed the order instantly to Bonnett at the controls, and all three of our guides dived gracefully off the ship and disappeared into the depths below.

"Let her settle to the bottom, Bonnett," ordered Mercer. "Slowly ... slowly...."

Bonnett handled the ship neatly, keeping her nicely trimmed. We came to rest on the bottom in four or five seconds, and as Mercer and I stared out eagerly through the round glass ports of the conning tower, we could see, very dimly, a cluster of dark, rounded projections cropping out from the bed of the ocean. We were only a few yards from the edge of the girl's village.

The scene was exactly as we had pictured it, save that it was not nearly as clear and well lighted. I realized that our eyes were not accustomed to the gloom, as were those of the girl and her people, but I could distinguish the vague outlines of the houses, and the slowly swaying shapes of monstrous growths.

"Well, Taylor," said Mercer, his voice shaking with

excitement, "here we are! And here"—peering out through the glass-covered port again—"are her people!"

The whole village was swarming around us. White bodies hovered around us as moths around a light. Faces pressed against the ports and stared in at us with great, amazed eyes.

Then, suddenly the crowd of curious creatures parted, and the girl came darting up with the five ancients she had showed us before. They were evidently the council responsible for the government of the village, or something of the sort, for the other villagers bowed their heads respectfully as they passed.

The girl came close to the port through which I was looking, and gestured earnestly. Her face was tense and anxious, and from time to time she glanced over her shoulder, as though she feared the coming of an enemy.

"Our time's short, I take it, if we are to be of service," said Mercer. "Come on, Taylor; into the diving suits!"

I signaled the girl that we understood, and would hurry. Then I followed Mercer into our tiny stateroom.

"Remember what I've told you," he said, as we slipped into the heavy woolen undergarments we were to wear inside the suits. "You understand how to handle your air, I believe, and you'll have no difficulty getting around in the suit if you'll just remember to go slowly. Your job is to get the whole village to get away when the enemy is sighted. Get them to come this way from the village, towards the ship, understand. The current comes from this direction; the way the vegetation bends shows that. And keep the girl's people away until I signal you to let them return. And remember to take your electric lantern. Don't burn it more than is necessary; the batteries are not large and the bulb draws a lot of current. Ready?"

I was, but I was shaking a little as the men helped me into the mighty armor that was to keep the pressure of several atmospheres from crushing my body. The helmet was the last piece to be donned; when it was screwed in place I stood there like a mummy, almost completely rigid.

Quickly we were put into the air lock, together with a large iron box containing a number of things Mercer needed. Darkness and water rushed in on us. The water closed over my head. I became aware of the soft, continuous popping sounds of the air-bubbles escaping from the relief valve of the head-piece.

For a moment I was dizzy and more than a little nauseated. I could feel the cold sweat pricking my forehead. Then there was a sudden glow of light from before me, and I started walking towards it. I found I could walk now; not easily, but, after I caught the trick of it, without much difficulty. I could move my arms, too, and the interlocking hooks that served me for fingers. When my real fingers closed upon a little cross-bar at the end of the armored arms, and pulled the bars towards me, the steel claws outside came together, like a thumb and two fingers.

In a moment we stood upon the bottom of the ocean. I turned my head inside the helmet, and there, beside me, was the sleek, smooth side of the *Santa Maria*. On my other side was Mercer, a huge, dim figure in his diving armor. He made an awkward gesture towards

his head, and I suddenly remembered something.

Before me, where I could operate it with a thrusting movement of my chin, was a toggle switch. I snapped it over, and heard Mercer's voice: "—n't forget everything I tell him."

"I know it," I said mentally to him. "I was rather rattled. O.K. now, however. Anything I can do?"

"Yes. Help me with this box, and then get the girl to put on the antenna you'll find there. Don't forget the knife and the light."

"Right!" I bent over the box with him, and we both came near falling. We opened the lid, however, and I hooked the knife and the light into their proper places outside my armor. Then, with the antenna for the girl, so that we could establish connections with her, and through her, with the villagers, I moved off.

This antenna was entirely different from the one used in previous experiments. The four cross-members that clasped the head were finer, and at their junction was

a flat black circular box, from which rose a black rod some six inches in height, and topped by a black sphere half the size of my fist.

These perfected thought-telegraphs (I shall continue to use my own designation for them, as clearer and more understandable than Mercer's) did not need connecting wires; they conveyed their impulses by Hertzian waves to a master receiver on the *Santa Maria*, which amplified them and re-broadcast them so that each of us could both send and receive at any time.

As I turned, I found the girl beside me, waiting anxiously. Behind her were the five ancients. I slipped the antenna over her head, and instantly she began telling me that danger was imminent.

To facilitate matters, I shall describe her messages as though she spoke; indeed, her pictures were as clear, almost, as speech in my native tongue. And at times she did use certain sound-words; it was in this way that I learned, by inference, that her name was *Imee*, that her people were called *Teemorn* (this may have

been the name of the community, or perhaps it was interchangeable—I am not sure) and that the shark-faced people were the *Rorn*.

"The Rorn come!" she said quickly. "Two days past, the three came again, and our old men refused to give up the slaves. Today they will return, these Rorn, and my people, the Teemorn will all be made dead!"

Then I told her what Mercer had said: that she and every one of her people must flee swiftly and hide, beyond the boat, a distance beyond the village. Mercer and I would wait here, and when the Rorn came, it was they who would be made dead, as we had promised. Although how, I admitted to myself, being careful to hide the thought that she might not sense it, I didn't know. We had been too busy since the girl's arrival to go into details.

She turned and spoke quickly to the old men. They looked at me doubtfully, and she urged them vehemently. They turned back towards the village, and in a moment the Teemorn were stalking by obediently, losing their slim white forms in the gloom

behind the dim bulk of the *Santa Maria*, resting so quietly on the sand.

They were hardly out of sight when suddenly Mercer spoke through the antenna fitted inside my helmet.

"They're coming!" he cried. "Look above and to your right! The Rorn, as Imee calls them, have arrived!"

I looked up and beheld a hundred—no, a thousand!—shadowy forms darting down on the village, upon us. They, too, were just as the girl had pictured them: short, swart beings with but the suggestion of a nose, and with pulsing gill-covers under the angles of their jaws. Each one gripped a long, slim white knife in either hand, and their tight-fitting shark-skin armor gleamed darkly as they swooped down upon us.

Eagerly I watched my friend. In the clasping talons of his left hand he held a long, slim flask that glinted even in that dim, confusing twilight. Two others, mates to the first, dangled at his waist. Lifting it high above his head, he swung his metal-clad right arm, and shattered the flask he held in his taloned left

hand.

For an instant nothing happened, save that flittering bits of broken glass shimmered their way to the sand. Then the horde of noseless ones seemed to dissolve, as hundreds of limp and sprawling bodies sank to the sand. Perhaps a half of that great multitude seemed struck dead.

"Hydrocyanic acid, Taylor!" cried Mercer exultantly. "Even diluted by the sea water, it kills almost instantly. Go back and make sure that none of the girl's people come back before the current has washed this away, or they'll go in the same fashion. Warn her to keep them back!"

I hurried toward the *Santa Maria*, thinking urgent warnings for Imee's benefit. "Stay back! Stay back, Imee! The Rorn are falling to the sand, we have made many of them dead, but the danger for you and your people is still here. Stay back!"

"Truly, do the Rorn become dead? I would like to see that with my own eyes. Be careful that they do not

make you dead also, and your friend, for they have large brains, these Rorn."

"Do not come to see with your own eyes, or you will be as the Rorn!" I hurried around the submarine, to keep her back by force, if that were necessary. "You must—"

"Help, Taylor!" cut in a voice—Mercer's. "These devils have got me!"

"Right with you!" I turned and hurried back as swiftly as I could, stumbling over the bodies of dead Rorn that had settled everywhere on the clean yellow sand.

I found Mercer in the grip of six of the shark-faced creatures. They were trying desperately to stab him, but their knives bent and broke against the metal of his armor. So busy were they with him that they did not notice me coming up, but finding their weapons useless, they suddenly snatched him up, one at either arm and either leg, and two grasping him by the head-piece, and darted away with him, carrying his bulging metal body between them like a battering

ram, while he kicked and struggled impotently.

"They are taking him to the Place of Darkness!" cried Imee suddenly, having read my impressions of the scene. "Oh, go quickly, quickly, toward the direction of your best hand—to your right! I shall follow!"

"No! No! Stay back!" I warned her frantically. All but these six Rorn had fallen victims of Mercer's hellish poison, and while they seemed to be suffering no ill effects, I thought it more than likely that some sly current might bring the deadly poison to the girl, did she come this way, and kill her as surely as it had killed these hundreds of Rorn.

To the right, she had said. Towards the Place of Darkness. I hurried out of the village in the direction she indicated, towards the distant gleam of Mercer's armor, rapidly being lost in the gloom.

"I'm coming, Mercer!" I called to him. "Delay them as much as you can. You're going faster than I can."

"I can't help myself much," replied Mercer. "Doing

what I can. Strong—they're devilish strong, Taylor. And, at close range, I can see you were right. They have true gill-covers; their noses are rudimentary and —"

"The devil take your scientific observations! Drag! Slow them down. I'm losing sight of you. For heaven's sake, drag!"

"I'm doing what I can. Damn you, if I could only get a hand free—" I realized that this last was directed at his captors, and plunged on.

Huge, monstrous growths swirled around me like living things. My feet crunched on shelled things, and sank into soft and slimy creeping things on the bottom. I cursed the water that held me back so gently yet so firmly; I cursed the armor that made it so hard for me to move my legs. But I kept on, and at last I began to gain on them; I could see them quite distinctly, bending over Mercer, working on him....

"Do your best, Taylor," urged Mercer desperately.

"We're on the edge of a sort of cliff; a fault in the

structure of the ocean bed. They're tying me with strong cords of leather. Tying a huge stone to my body. I think they—" I had a momentary flash of the scene as Mercer saw it at that instant: the horrid noseless face close to his, the swart bodies moving with amazing agility. And at his very feet, a yawning precipice, holding nothing but darkness, leading down and down into nothingness.

"Run quickly!" It was Imee. She, too, had seen what I had seen. "That is the Place of Darkness, where we take those whom the Five deem worthy of the Last Punishment. They will tie the stone to him, and bear him out above the Blackness, and then they will let him go! Quickly! Quickly!"

I was almost upon them now, and one of the six turned and saw me. Three of them darted towards me, while the others held Mercer flat upon the edge of the precipice. If they had only realized that by rolling his armored body a foot or two, he would sink ... without the stone.... But they did not. Their brains had little reasoning power, apparently. The attaching of a stone was necessary, in their

experience; it was necessary now.

With my left hand I unhooked my light; I already gripped my knife in my right hand. Swinging the light sharply against my leg, I struck the toggle-switch, and a beam of intense brilliancy shot through the gloom. It aided me, as I had thought it would; it blinded these large-eyed denizens of the deep.

Swiftly I struck out with the knife. It hacked harmlessly into the shark-skin garment of one of the men, and I stabbed out again. Two of the men leaped for my right arm, but the knife found, this time, the throat of the third. My beam of light showed palely red, for a moment, and the body of the Rorn toppled slowly to the bed of the ocean.

The two shark-faced creatures were hammering at me with their fists, dragging at my arms and legs, but I plunged on desperately towards Mercer. Myriads of fish, all shapes and colors and sizes, attracted by the light, swarmed around us.

"Good boy!" Mercer commended. "See if you can

break this last flask of acid, here at my waist. See—"

With a last desperate plunge, fairly dragging the two Rorn who tugged at me, I fell forward. With the clenched steel talons of my right hand, I struck at the silvery flask I could see dangling from Mercer's waist. I hit it, but only a glancing blow; the flask did not shatter.

"Again!" commanded Mercer. "It's heavy annealed glass—hydrocyanic acid—terrible stuff—even the fumes—"

I paid but slight heed. The two Rorn dragged me back, but I managed to crawl forward on my knees, and with all my strength, I struck at the flask again.

This time it shattered, and I lay where I fell, sobbing with weakness, looking out through the side window of my head-piece.

The five Rorn seemed to suddenly lose their strength. They struggled limply for a moment, and then floated down to the waiting sand beneath us.

"Finish," remarked Mercer coolly. "And just in time. Let's see if we can find our way back to the *Santa Maria*."

We were weary, and we plodded along slowly, twin trails of air-bubbles like plumes waving behind us, rushing upwards to the surface. I felt strangely alone at the moment, isolated, cut off from all mankind, on the bottom of the Atlantic.

"Coming to meet you, all of us," Imee signaled us. "Be careful where you step, so that you do not walk in a circle and find again the Place of Darkness. It is very large."

"Probably some uncharted deep," threw in Mercer. "Only the larger ones have been located."

For my part, I was too weary to think. I just staggered on.

A crowd of slim, darting white shapes surrounded us. They swam before us, showing the way. The five patriarchs walked majestically before us; and

between us, smiling at us through the thick lenses of our headpieces, walked Imee. Oh, it was a triumphal procession, and had I been less weary, I presume I would have felt quite the hero.

Imee pictured for us, as we went along, the happiness, the gratefulness of her people. Already, she informed us, great numbers of young men were clearing away the bodies of the dead Rorn. She was so happy she could hardly restrain herself.

A dim skeleton shape bulked up at my left. I turned to look at it, and Imee, watching me through the lights of my head-piece, nodded and smiled.

Yes, this was the very hulk by which she had been swimming when the shark had attacked her, the shark which had been the cause of the accident. She darted on to show me the very rib upon which her head had struck, stunning her so that she had drifted, unconscious and storm-tossed, to the shore of Mercer's estate.

I studied the wreck. It was battered and tilted on its

beam ends, but I could still make out the high poop that marked it as a very old ship.

"A Spanish galleon, Mercer," I conjectured.

"I believe so." And then, in pictured form, for Imee's benefit, "It has been here while much time passed?"

"Yes." Imee came darting back to us, smiling. "Since before the Teemorn, my people were here. A Rorn we made prisoner once told us his people discovered it first. They went into this strange skeleton, and inside were many blocks of very bright stone." She pictured quite clearly bars of dully-glinting bullion. Evidently the captive had told his story well.

"These stones, which were so bright, the Rorn took to their city, which is three swims distant." How far that might be, I could not even guess. A swim, it seemed, was the distance a Teemorn could travel before the need for rest became imperative. "There were many Rorn, and they each took one stone. And of them, they made a house for their leader." The leader, as she pictured him, being the most hideous travesty of a

thing in semi-human form that the mind could imagine: incredibly old and wrinkled and ugly and gray, his noseless face seamed with cunning, his eyes red rimmed and terrible, his teeth gleaming, white and sharp, like fangs.

"A whole house, except the roof," she went on. "It is there now, and it is gazed at with much admiration by all the Rorn. All this our prisoner told us before we took him, with a rock made fast to him, out over the Place of Darkness. He, too, was very proud of their leader's house."

"Treasure!" I commented to Mercer. "If we could find the city of the Rorn, we might make the trip pay for itself!"

I could sense his wave of amusement.

"I think," he replied, "I'd rather stand it myself. These Rorn don't appeal to me."

It was over half an hour before we were at last free of our diving suits.

The first thing Captain Bonnett said:

"We've got to get to the surface, and that quickly. Our air supply is running damnably low. By the time we blow out the tanks we'll be just about out. And foul air will keep us here until we rot. I'm sorry, sir, but that's the way matters stand."

Mercer, white-faced and ill, stared at him dazedly.

"Air?" he repeated groggily—I knew just how he felt —"We should have lots of air. The specifications—"

"But we're dealing with facts, not specifications, sir," said Captain Bonnett. "Another two hours here and we won't leave ever."

"Then it can't be helped, Captain," muttered Mercer. "We'll go up. And back. For more compressed air. We must remember to plot our course exactly. You kept the record on the way out as I instructed you?"

"Yes, sir," said Captain Bonnett.

"Just a minute, then," said Mercer.

Weakly he made his way forward to the little cubbyhole in which was housed the central station of his thought-telegraph. I didn't even inspect the gleaming maze of apparatus. I merely watched him dully as he plugged in an antenna similar to the one we had left with Imee, and adjusted the things on his head.

His eyes brightened instantly. "She's still wearing her antenna," he said swiftly over his shoulder. "I'll tell her that something's happened; we must leave, but that we will return."

He sat there, frowning intently for a moment, and then dragged the antenna wearily from his head. He touched a switch somewhere, and several softly glowing bulbs turned slowly red and then dark.

"You and I," he groaned, "had better go to bed. We overdid it. She understands, I think. Terribly sorry, terribly disappointed. Some sort of celebration planned, I gather. Captain Bonnett!"

"Yes, sir?"

"You may proceed now as you think best," said Mercer. "We're retiring. Be sure and chart the course back, so we may locate this spot again."

"Yes, sir!" said Captain Bonnett.

When I awoke we were at anchor, our deck barely awash, before the deserted beach of Mercer's estate. Still feeling none too well, Mercer and I made our way to the narrow deck.

Captain Bonnett was waiting for us, spruce in his blue uniform, his shoulders bowed as always.

"Good morning, gentlemen," he offered, smiling crisply. "The open air seems good, doesn't it?"

It did. There was a fresh breeze blowing in from the Atlantic, and I filled my lungs gratefully. I had not realized until that instant just how foul the air below had been.

"Very fine, Captain," said Mercer, nodding. "You have signaled the men on shore to send out a boat to take us off?"

"Yes, sir; I believe they're launching her now."

"And the chart of our course—did the return trip check with the other?"

"Perfectly, sir." Captain Bonnett reached in an inner pocket of his double-breasted coat, extracted two folded pages, and extended them, with a little bow, to Mercer.

Just as Mercer's eager fingers touched the precious papers, however, the wind whisked them from Bonnett's grasp and whirled them into the water.

Bonnett gasped and gazed after them for a split second; then, barely pausing to tear off his coat, he plunged over the side.

He tried desperately, but before he could reach either one of the tossing white specks, they were washed

beneath the surface and disappeared. Ten minutes later, his uniform bedraggled and shapeless, he pulled himself on deck.

"I'm sorry, sir," he gasped, out of breath. "Sorrier than I can say. I tried—"

Mercer, white-faced and struggling with his emotions, looked down and turned away.

"You don't remember the bearings, I suppose?" he ventured tonelessly.

"I'm sorry—no."

"Thank you, Captain, for trying so hard to recover the papers," said Mercer. "You'd better change at once; the wind is sharp."

The captain bowed and disappeared down the conning tower. Then Mercer turned to me, and a smile struggled for life.

"Well, Taylor, we helped her out, anyway," he said

slowly. "I'm sorry that—that Imee will misunderstand when we don't come back."

"But, Mercer," I said swiftly, "perhaps we'll be able to find our way back to her. You thought before, you know, that—"

"But I can see now what an utterly wild-goose chase it would have been." Mercer shook his head slowly. "No, old friend, it would be impossible. And—Imee will not come again to guide us; she will think we have deserted her. And"—he smiled slowly up into my eyes—"perhaps it is as well. After all, the photographs and the data I wanted would do the world no practical good. We did Imee and her people a good turn; let's content ourselves with that. I, for one, am satisfied."

"And I, old timer," I said, placing my hand affectionately upon his shoulder. "Here's the boat. Shall we go ashore?"

We did go ashore, silently. And as we got out of the boat, and set foot again upon the sand, we both turned and looked out across the smiling Atlantic,

dancing brightly in the sun.

The mighty, mysterious Atlantic—home of Imee and her people!

#19 Vandals of the Stars, by A. T. Locke:

A livid flame flares across space--and over Manhattan hovers Teuxical, vassal of Malfero, Lord of the Universe, who comes with ten thousand warriors to ravage and subjugate one more planet for his master.

Vandals of the Stars By A. T. Locke

It came suddenly, without warning, and it brought consternation to the people of the world.

A livid flame flares across Space--and over Manhattan hovers Teuxical, vassal of Malfero, Lord of the Universe, who comes with ten thousand warriors to ravage and subjugate one more planet for his master.

A filament of flame darted down the dark skies one moonless night and those who saw it believed, at first, that it was a meteor. Instead of streaking away into oblivion, however, it became larger and larger, until it seemed as though some vagrant, blazing star was about to plunge into the earth and annihilate the planet and every vestige of life upon it. But then it drew slowly to a stop high up in the atmosphere, where it remained motionless, glowing white and incandescent against the Stygian background of the overcast skies.

In shape it resembled a Zeppelin, but its dimensions very apparently exceeded by far those of any flying craft that ever had been fabricated by the hand of man.

As it hung poised high up in the air it gradually lost its dazzling glow and became scarlet instead of white. Then, as it continued to cool, the color swiftly drained from it and, in a few minutes, it shone only with the dull and ugly crimson of an expiring ember. In a half-hour after it first had appeared its effulgence had vanished completely and it was barely visible to the

millions who were staring up toward it from the earth.

It seemed to be suspended directly above Manhattan, and the inhabitants of New York were thrown into a feverish excitement by the strange and unprecedented phenomenon.

For it scarcely had come to a stop, and certainly it

had not been poised aloft for more than a few minutes, when most of those who had not actually witnessed its sensational appearance were apprised of the inexplicable occurrence by the radiovision, which were scattered throughout the vast metropolis. In theaters and restaurants and other gathering places, as well as in millions of homes, a voice from the Worldwide Broadcasting Tower announced the weird visitant. And its image, as it glowed in the night, was everywhere transmitted to the public.

Only a short time after it first had been observed people were thronging roof-tops, terraces, and streets, and gazing with awe and wonder at the great luminous object that was floating high above them.

There were those who thought that the world was coming to an end, and they either were dumb with fright or strident with hysteria. People with more judgment, and a smattering of scientific knowledge, dismissed the thing as some harmless meteorological manifestation that, while interesting, was not necessarily dangerous. And there were many, inclined to incredulity and skepticism, who believed that they

were witnessing a hoax or an advertising scheme of some new sort.

But as the moments went by the world commenced to become stirred and alarmed by the reports which came over the radiovisors.

For powerful planes and metal-shelled Zeppelins had climbed swiftly aloft to investigate the incomprehensible Thing that was poised high above Manhattan, and almost unbelievable reports were being sent earthward.

Dirk Vanderpool had been sitting alone on the broad terrace of his apartment that occupied the upper stories of the great Gotham Gardens Building when he saw that streak of fire slip down against the darkness of the night.

For a moment he, too, had believed that he was watching a meteor, but, when he saw it come to a slow stop and hang stationary in the heavens, he rose to his feet with an exclamation of surprise.

For a while he gazed upward with an expression of astonishment on his face and then he turned as he heard someone walking softly in his direction. It was Barstowe, his valet, and the eyes of the man were alive with fear.

“What is that thing, Mr. Vanderpool?” he asked in a voice that trembled with alarm. Barstowe was a man of middle age, diminutive in size, and he had the appearance of being nearly petrified with terror. “They are saying over the televisor that--”

“What are they saying about it?” asked Dirk somewhat impatiently.

“That no one can explain what it is,” continued Barstowe. “It must be something terrible, Mr. Vanderpool.”

“Wheel out the luciscope,” ordered Dirk.

Barstowe disappeared into the apartment and returned with a cabinet that was mounted on small, rubber-tired wheels. The top of it was formed of a

metallic frame in which a heavy, circular, concave glass was fitted. The frame was hinged in front so that it could be raised from the rear and adjusted to any angle necessary to catch the light rays from any distant object. Within the cabinet the rays passed through an electrical device that amplified them millions of times, thus giving a clear, telescopic vision of the object on which the luciscope was focused.

This instrument, years before, had supplanted entirely the old-fashioned telescopes which not only had been immense and unwieldy but which also had a very limited range of vision.

Dirk adjusted the light-converger so that it caught the rays that were being emanated by the weird and shimmering mass that was suspended almost directly above the lofty terrace on which he was standing.

Then he switched on the current and glanced into the eye-piece of the apparatus. For several moments he remained silent, studying the image that was etched so vividly on the ground-glass within the luciscope.

“It is a queer thing, there is no doubt about that,” he confessed when finally he raised his head. “It resembles a gigantic Zeppelin in shape but it does not seem to have any undercarriage or, as far as I can see, any indication of propellers or portholes. I would say, though, Barstowe, that it might be a ship from some other planet if it wasn’t for the fact that it seems to be in an almost molten state.”

Dirk again looked into the luciscope and then he made a few adjustments with a thumb-screw that projected from the side of the apparatus.

“It is up about forty thousand feet,” he told Barstowe, “and it must be more than a half-mile in length. Probably,” he added, “it is a planetary fragment of some odd composition that is less responsive to gravitation than the materials with which we are familiar. You will find, Barstowe, that there is nothing about it that science will not be able to explain. That will be all now,” he concluded.

Barstowe walked over the terrace and disappeared into the apartment. Dirk, left alone, wheeled the

luciscope over by the chair in which he had been sitting and near which a radiovisor was standing.

He switched on the latter and listened to the low but very distinct voice of the news-dispatcher.

“--and planes and Zeppelins now are starting up to investigate the strange phenomenon--”

Again Dirk placed an eye to the lens of the luciscope and once more the Thing leaped into his vision. The powerful machine brought it so close to him that he could see the heat waves quiver up from it.

The light that it radiated illuminated the night for thousands of feet and Dirk could see, by means of that crimson glare, that many planes and Zeppelins were circling around the mysterious visitant. None of them, however, approached the alien freak, the heat apparently being too intense to permit close inspection.

[Image description start. A black and white illustration done in mostly black, showing airplanes flying over a city with the sky dark. Image description end.]

Dirk himself was tempted for a moment to jump into a plane and go up and take a look at the fiery mass.

But, after a moment's consideration, he decided, that

it would be far more interesting and comfortable to remain right where he was and listen to the reports which were being sent down from above.

“--thus far there seems to be no cause for alarm, and people are advised to remain calm--careful observations of the luminous monster are being made and further reports concerning it will be broadcast--”

Dirk Vanderpool rose to his feet, walked to the coping of the terrace and peered into the magnascope that was set into the wall.

He saw that the street, far below him, was jammed with struggling people and the device through which he was looking brought their faces before him in strong relief. Dirk was deeply interested and, at the same time, gravely concerned as he studied the upturned countenances in the mob.

Fear, despair, reckless abandon, mirth, doubt, religious ecstasy and all the other nuances in the gamut of human emotions and passions were reflected in those distorted visages which were

gazing skyward.

The silvery humming of a bell diverted his attention from the scene of congestion below him and, turning away, he walked across the terrace and into the great living room of his luxurious abode.

Stepping to the televisor, he turned a tiny switch, and the face of a girl appeared in the glass panel that was framed above the sound-box. He smiled as he lifted the receiver and placed it to his ear.

“What is the matter, Inga?” he asked. “You look as if you were expecting--well, almost anything disastrous.”

“Oh, Dirk, what is that thing?” the girl asked. “I really am frightened!”

He could see by the expression in her blue eyes that she, too, was becoming a victim of the hysteria that was taking possession of many people.

“I wouldn’t be alarmed, Inga,” he replied reassuringly.

“I don’t know what it is, and no one else seems to be able to explain it.”

“But it is frightful and uncanny, Dirk,” the girl insisted, “and I am sure that something terrible is going to happen. I wish,” she pleaded, “that you would come over and stay with me for a little while. I am all alone and--”

“All right, Inga,” he told her. “I will be with you in a few minutes.”

He hung up the receiver of the televisor and clicked off the switch. The image of the golden-haired girl to whom he had been speaking slowly faded from the glass.

Attiring himself for a short sixty-mile hop down Long Island, Dirk passed out to the landing stage and, stepping into the cabin of his plane, he threw in the helicopter lever. The machine rose straight into the air for a couple of hundred feet and then Dirk headed it westward to where the nearest ascension beam sent its red light towering toward the stars. It marked

a vertical air-lane that led upward to the horizontal lanes of flight.

Northbound ships flew between two and four thousand feet; southbound planes between five and seven thousand feet; those eastbound confined themselves to the level between nine and eleven thousand feet, while the westbound flyers monopolized the air between twelve and fourteen thousand feet.

All planes flying parallel to the earth were careful to avoid those red beacons which marked ascension routes, and the shafts of green light down which descending planes dropped to the earth or into lower levels of travel.

When Dirk's altimeter indicated seventy-five hundred feet he turned the nose of his ship eastward and adjusted his rheostat until his motors, fed by wireless current, were revolving at top speed.

The great canyons of Manhattan, linked by arches and highways which joined and passed through

various levels of the stupendous structures of steelite and quartzite, passed swiftly beneath him; and, after passing for a few minutes over the deserted surface of Long Island, he completed his sixty-mile flight and brought his ship to a rest on a landing stage that was far up on the side of a vast pile that rose up close to the shore of the Sound.

As soon as he stepped from the door of the cabin he was joined by a girl who, apparently, had been lingering there, awaiting his arrival.

She was perhaps twenty years old, and she had the golden hair, the light complexion, and the blue eyes which still were characteristic of the women of northern Europe.

The slender lines of her exquisite figure and the supple grace which she displayed when she moved toward Dirk were evidence, however, of the Latin blood which was in her veins.

For Inga Fragoni, the daughter and heiress of Orlando Fragoni, seemed to be a culmination of all of

the desirable qualities of the women of the south and those of the north.

The terrace on which Dirk had landed was illuminated by lights which simulated sunshine, and their soft bright glow revealed the violet hue of her eyes and the shimmering gloss of her silken hair. She wore a sleeveless, light blue tunic which was gathered around her waist with a bejeweled girdle.

On her tiny feet she wore sandals which were spun of webby filaments of gold and platinum.

“Dirk, I am so glad that you are here!” she exclaimed. “I felt so much alone when I called you up. Dad is locked in the observatory with Professor Nachbaren and three or four other men and the servants--well, they all are so terrified that it simply alarms me to have them around.”

“But that is Stanton’s plane there, isn’t it?” asked Dirk, indicating a powerful looking machine that stood on the terrace.

“Yes, Dirk,” the girl replied. “He arrived here three or four minutes before you did. I thought, at first, that it was you coming. And Dirk,” she continued, with a note of excitement in her voice, “he flew up to look at that thing, and I know that he is as frightened about it as I am.”

Dirk grunted, but he gave no expression of the dislike and distrust that Stanton aroused in him. The latter, he knew, was very much inclined to look with favor on Inga, and his presumption annoyed Dirk because, while he and the girl had not declared their intention of living together, they were very much in love with each other.

“You will want to hear him tell about it, I know, Dirk,” the girl said. “I left Stanton up on the garden terrace when I saw you coming down. Come; we will go and join him.”

Dirk and Inga strolled slowly along paths which were lined with exotic shrubbery and plants. Here and there a fountain tossed its glittering spray high into the air while birds, invisible in the feathery foliage,

warbled and thrilled entrancingly. Soft music, transmitted from the auditoriums below, blended so harmoniously with the atmosphere of the terraces that it seemed to mingle with and be a part of the drifting, subtle scents of the abundant flowers which bloomed on every side.

For these upper terraces of Fragoni's palace were enclosed, during inclement weather, with great glass plates which, at the touch of a button, automatically appeared or disappeared.

Winding their way easily upward, Dirk and Inga came finally to a secluded terrace which overlooked the Sound. Here they saw Stanton, who was unaware of their approach, looking skyward at the dim and sinister shape which was outlined against the sky. Stanton's brow was contracted and his expression was filled with apprehension. He started suddenly when he became conscious of the presence of Dirk and the lovely daughter of Fragoni.

He rose to his feet, a short man in his forties, stocky in build and somewhat swarthy in complexion. He

contrasted very unfavorably with Dirk, who was tall and well-built and who had abundant blond hair and steady steel-blue eyes.

“What do you make of that thing, Vanderpool?” he asked, almost ignoring the presence of Inga.

“I don’t know enough about it yet to be able to express an opinion,” Dirk replied. “We will find out about it soon enough,” he added, “so why worry about it in the meantime?”

“It is well enough to affect such an attitude,” said Stanton, with a touch of sarcasm in his voice, “but let me tell you, Vanderpool, that there is good reason to worry about it.”

Dirk frowned at the statement as he saw a shadow pass over the fair face of Inga.

“That thing up there,” continued Stanton, with conviction in his voice, “is not a natural phenomenon. I flew fairly close to it in my plane and I know what I am speaking about. That thing is some sort of a

monster, Vanderpool, that is made of metal or of some composition that is an unearthly equivalent of metal. It is a diabolical creation of some sort that has come from out of the fathomless depths of the universe.” He shuddered at the fantasy that his feverish imagination was creating. “It is metal, I tell you,” he continued, “but it is metal that is endowed with some sort of intelligence. I was up there,” he breathed swiftly, “and I saw it hanging there in the sky, quivering with heat and life.”

“You are nervous, Stanton,” said Vanderpool coolly. “Get a grip on yourself, man, and look at the thing reasonably. If that thing has intelligence,” he added, “we will find some way to slay it.”

“Slay it!” exclaimed Stanton. “How can you expect to slay a mad creation that can leap through space, from world to world, like a wasp goes darting from flower to flower? How can you kill a thing which not only defies absolute zero but also the immeasurable heat which its friction with the atmosphere generated when it plunged toward the earth? How can you kill a thing that seems to have brains and nerves and bones

and flesh of some strange substance that is harder and tougher than any earthly compound we have discovered?”

He stopped speaking for a moment. They listened to the voice that was broadcasting from the Worldwide Tower.

“--our planes have approached to within a few thousand feet of it and are playing their searchlights over the surface of the leviathan. It is not a meteorite of any kind that scientists have heretofore examined--its surface is smooth and unpitted and shows no apparent effect of the tremendous heat to which it was subjected during its drop through the atmosphere. It seems to be immune to gravity--its weight must be tremendous, and it is fully three-quarters of a mile long and between seven and eight hundred feet in diameter at its widest part, but it lies motionless--motionless--at about forty thousand feet.”

“It doesn’t appear now as if it would prove very dangerous,” remarked Dirk.

“--and people are warned again to maintain their composure and to go to their homes and remain there for their own protection and the protection of others. Riots and serious disturbances are reported from cities in all parts of the world--mobs are swarming the streets of Manhattan and the other boroughs of New York, and the police are finding it difficult to restrain the frenzied populations in other centers....”

There was a pause, then, of some moments, and then the voice of the broadcaster, vibrant with excitement, was heard again.

“--a plane has made a landing on the surface of the monstrosity, which, it seems, has not only lost its heat but is becoming decidedly cold--”

A servant appeared from among the shrubbery and paused before Dirk.

“There is a call for you, Mr. Vanderpool,” he said respectfully.

Dirk excused himself and, entering the sumptuous

apartment that opened from the terrace, went to the televisor. He saw the face of Sears, the chief secretary of Fragoni, in the glass panel.

“There will be a meeting of the council at nine o’clock in the morning, Mr. Vanderpool,” came the voice over the wire.

“Thank you, Sears,” replied Dirk. “It happens that Stanton is here at the present time. Shall I notify him of the conclave?”

“If you will, please,” Sears responded. “By the way, Mr. Vanderpool, is there anything wrong at your apartment? I tried to call you there before I located you here and I failed to get any response.”

“I guess that all of my servants have run out from under cover because of their fear of that thing in the sky,” Dirk responded. “Do you know anything about it, Sears?” he asked.

“It will be discussed at the meeting to-morrow morning,” replied Sears shortly. “Good night, Mr.

Vanderpool.”

Dirk, upon returning to the terrace, saw that both Stanton and Inga were silently and fearfully looking up into the night.

“A meeting of the council at nine o’clock in the morning, Stanton,” Dirk said abruptly. “I told Sears I would notify you.”

“I thought that we would be called together very soon,” said Stanton. “It’s concerning that damn thing up there.”

“Perhaps,” agreed Dirk carelessly. “Well,” he added, “I believe that I will hop home and get some sleep.”

“Sleep!” exclaimed Stanton. “Sleep? On a night like this?”

“Oh, Dirk,” pleaded Inga, “stay here with me, won’t you? I am not going to bed because I just know that I wouldn’t be able to close my eyes.”

“Let him go, Inga, if he wants to sleep,” urged Stanton. “I will stay here and keep watch with you.”

“--and if order is not restored in the streets of Manhattan within the course of a short time, the authorities will resort to morphite gas to quell the turbulence and rioting--”

“The streets must be frightfully congested,” said Inga. “It is the first occasion in a long time that the police have had to threaten the use of morphite.”

“--we do not want to alarm people unnecessarily but we have to report,” came the hurried voice of the broadcaster, “that the monstrous mass that has been hanging above the city just made a sudden drop of five thousand feet and again came to a stop. It is now a little more than six miles over Manhattan and-- again it has dropped. This time it fell like a plummet for twelve thousand feet. It is now about twenty thousand feet, some four miles, above Manhattan and--”

A cry of alarm came from the lips of Inga as she gazed

upward and saw that gigantic, ominous-appearing object loom dim and vast in the darkness above them.

She went to Dirk and threw her arms around him, as if she were clinging to him for protection.

“Don’t leave me, Dirk,” she whispered. “I can just feel that something terrible is going to happen, and I want you with me!”

“I’ll stay with you, of course,” whispered Dirk. Something of that feeling of dread and apprehension which so fully possessed his two companions entered into his mind. “Don’t tremble so, Inga,” he pleaded. “It is a strange thing, but we will know more about it in the morning. Be calm until then, my dear, if you can.”

He looked over the shoulder of the girl, whose face was buried against his breast, and he saw a hundred great red and green shafts of light shooting up into the air. Fleeting shadows seemed to pass swiftly up and down them, and he knew that thousands of planes were abroad, some of them seeking the

heights and others dropping down.

The great towers of Long Island were all aglow, and it was apparent that few people were sleeping that night. The scarlet sky over Manhattan indicated that the center of the metropolis, too, was alive to the menace of the weird visitant that now was so plainly visible.

All night long they remained on the terrace. Dirk and Inga seated close together and Stanton, at a distance, brooding alone over the disaster which he felt was impending.

The illuminated dial of the great clock that was a part of the beacon-tower on the Metropole Landing Field told of the slow passing of the hours.

All night long they listened to the reports that came through the radiovisor and watched that immobile, threatening monster of metal.

But it remained static during the rest of the night. And, with the coming of a gray and sunless dawn, it

still hung there, motionless, silent and sinister.

The next morning the President of the United States of the World, from the capitol at The Hague, issued a proclamation of martial law, to become effective at once in all parts of the world.

The edict forbade people to leave their homes, and it was vigorously executed, wherever the police themselves were not in a state of demoralization.

At about the same time a special meeting of the Supreme Congress was called, the body to remain in session until some solution of the mystery had been arrived at.

At the same time that martial law was declared, however, and the special assemblage of lawmakers convened, a statement was issued in which an attempt was made to eliminate from the minds of the people the idea that the undefinable object above the metropolis was at all dangerous.

It was, indeed, suggested that it very probably was

some sort of new device which had been constructed on the earth and which was being introduced to the people of the world in a somewhat sensational manner by the person or persons who were responsible for it.

The fears of the populace were, to some extent, allayed by this means, and some degree of order restored.

At nine o'clock Dirk Vanderpool was shown into the council chamber in the palace of Orlando Fragoni, and he was closely followed by Stanton. Fragoni was already there, and he greeted the two men with a countenance that was serene but that, nevertheless, revealed indications of concern. He was a man past middle age, tall and strikingly handsome in appearance. His eyes were dark and penetrating and his forehead, high and wide, was crowned by an abundance of snow-white hair. His voice, while pleasing to the ear, was vibrant with life and energy, and he spoke with the incisive directness of one accustomed to command.

For Orlando Fragoni, as nearly as any one man might be, was the ruler of the world.

It was in the early part of the twentieth century that wealth had commenced to concentrate into a relatively few hands. This was followed by a period in which vast mergers and consolidations had been effected as a result of the financial power and genius for organization which a few men possessed. A confederation of the countries of the world was brought about by industrial kings who had learned, in one devastating war, that militarism, while it might bring riches to a few, was, in the final analysis, destructive and wasteful.

Mankind the world over, relieved of the menace of war, made more progress in a decade than they had made in any previous century, but all the time the invisible concentration of power and money continued.

And, in 1975, the affairs of the world were controlled by five men, of whom Orlando Fragoni was the most powerful and most important.

His grandfather had been a small banker, and out of his obscure transactions the great House of Fragoni had arisen. The money power of the world was now controlled by Orlando Fragoni. Dirk Vanderpool, partly as a result of a vast inheritance and partly through his own ability and untiring industry, dominated the transportation facilities of the world. Planes and Zeppelins, railroad equipment and ships, were built in his plants and operated by the many organizations which he controlled.

Stanton had inherited the agricultural activities of the world and, in addition to this, he was the sovereign of distribution. He owned immense acreages in all of the continents; he not only cultivated every known variety of produce, but also handled the sale of his products through his own great chains of stores. His father had been one of the great geniuses of the preceding generation, but Stanton, while inheriting the commercial empire which he had ruled, had not inherited much of the ability which had gone into the establishment of it.

There were two other members of that invisible

council of Five, the very existence of which was not even suspected by the general populace of the world.

Sigmund Lazarre was the world's mightiest builder, and millions of great structures, which were built of material from his own mines, were under his control. It was Lazarre, too, who owned the theaters and other amusement centers in which millions upon millions of people sought relaxation every day. The creation and application of electrical power made up the domain of Wilhelm Steinholt, who also owned the factories that made the machinery of the world.

Absolute control of all of the necessities and luxuries of life, in fact, were in the hands of the five men, who used their vast power wisely and beneficently.

Ostensibly the peoples of the world ruled themselves by means of a democratic form of government.

In reality their lives were directed by a few men whose power and wealth were entirely unsuspected by any but those who were close to them.

The council room in which Fragoni had received Dirk and Stanton was lofty and sumptuously appointed.

The rugs which covered the floor were soft to the tread, and the walls and ceiling were adorned with a series of murals which represented the various heavenly constellations.

At the far end of the chamber there was a staircase, and Dirk was among those who knew that it led up to the great observatory in which Fragoni and certain of his scientific associates spent so much of their time at night.

For men had commenced to talk about the conquest of the stars, and it was generally believed that it would not be many years more before a way would be found to traverse the interplanetary spaces.

“We are rather fortunate, my friends,” Fragoni said to his two associates, “to have been the witnesses of the event that transpired last night.”

“Fortunate!” exclaimed Stanton. “Then you know that

the thing is harmless?”

A little smile lit the benign and scholarly countenance of Fragoni as he calmly regarded Stanton.

“We know very little about it,” he replied after a brief pause, “and, if our surmises are correct, it may be very far from harmless. It is intensely interesting, nevertheless,” he continued, “because that thing, as you term it, unquestionably is directed by intelligence. Without the slightest doubt the people of the earth are about to behold a form of life from some far-away planet. What that form will be,” he added, with an almost imperceptible shrug of his shoulders, “it is impossible to forecast.”

“But it was so hot,” commenced Stanton, “that--”

“True,” agreed Fragoni, “but it also is large and it may be that only the outer shell of it was affected by friction with the atmosphere that surrounds the earth. Nachbarn,” he continued, “is certain that there is intelligent life within it; and Nachbarn,” he added dryly, “is usually right.”

While Fragoni had been speaking, two more men had quietly joined them.

“Good morning, Lazarre,” Fragoni said, addressing a short, swarthy man who, very apparently, was of Jewish extraction.

“Good morning,” the other replied in a soft and mellifluous voice. “It seems,” he continued, with a twinkle in his eyes, “as if some of my pretty buildings may be toppled over soon.”

“Maybe,” agreed Fragoni. “And maybe,” he added more seriously, “much more than your buildings will be toppled over, Lazarre.”

“That thing, then, is...?” questioned the heavy-set, slow-speaking, blue-eyed Teuton who had come into the room with Lazarre.

“We do not know, Steinholt,” admitted Fragoni, “but our knowledge undoubtedly will be increased considerably within the next few hours. And now,” he said, “we will consider the problem at hand.”

“--the object which has created such unrest is slowly rising. It is now some twenty-five thousand feet above Manhattan. It is--”

The voice from the radiovisor attracted the attention of the five men, and, with one accord, they rushed to the terrace and looked toward Manhattan. They saw the great leviathan high in the air for a moment, and then, suddenly, it seemed to vanish from sight.

“It’s gone!” exclaimed Stanton, with a sigh of relief. “It must have been some odd atmospheric freak, that’s all.”

They searched the skies through the luciscope that was on the terrace, but failed to detect any trace of the monster.

“That seems to simplify matters,” remarked Fragoni as they again walked back into the great conference room. But here, once more, they heard the voice from the Worldwide Tower.

“--we are advised by Chicago that the thing, dull-red

with heat, is hovering only a couple of thousand feet over the city. Thousands in the streets are being killed by the heat it is radiating--panic reigns, despite a rigorous enforcement of martial law. The strange object just rose suddenly to a high altitude and disappeared--"

"It's another one of those damned things," asserted Stanton. "That couldn't go a thousand miles a minute!"

"It can go faster than that, if I am not mistaken," said Fragoni. And it presently appeared that he was right, for in a couple of minutes the radiovisor transmitted the news that it was over San Francisco, where it remained for only a few seconds. It was not more than a minute later that word came from Shanghai that it had passed slowly over that city. Then again it was poised high over Manhattan, crimson with heat.

"Is there any possible defense against it, Steinholt?" Fragoni asked. The Teuton shook his head with an air of finality.

“None,” he said, “as far as I can determine now. We can create and direct artificial lightning that would reduce this building to a mass of powdered stone and fused metal in a fraction of a second. But I am certain that it wouldn’t leave as much as a scratch on that monster up there. We might try the Z-Rays on it, but an intelligence that could devise such a craft would undoubtedly have the wisdom to protect it against such an elementary menace as rays. Even the mightiest explosives that we have wouldn’t send a tremor through that mighty mass.”

“Why not await developments?” asked Dirk. “We do not even know the nature of the thing we are trying to combat.”

“It’s solid metal,” insisted Stanton tenaciously. “It’s a metal body with a metal brain.”

“Don’t be ridiculous,” said Steinholt. “It seems quite apparent that the craft has come from another planet, and, if I am not greatly mistaken, there are intelligent creatures inside it.”

“In any event,” said Dirk, “it seems impractical to make any plans until we know more about it. I suggest that we empower Fragoni to act for the rest of us in this matter.”

“That is very agreeable to me,” said Steinholt. “A crisis very possibly may arise in which the quick judgment of one man may be necessary to avert the danger that always is inherent in delay.”

“You hold my proxy,” Lazarre said to Fragoni, “and I assume that Stanton is agreeable to this procedure.”

“--the thing is moving very slowly eastward in the direction of Long Island Sound. It is, at the same time, losing altitude. Its movements are being carefully watched. As yet we see no cause for immediate alarm--people are advised to remain calm--”

“Yes, I am agreeable,” said Stanton nervously and hastily. “If there are things in it with which we can compromise, I would suggest that we do not offend them.”

“I am, then, empowered to act for all of you,” said Fragoni, ignoring the suggestion of Stanton.

He rose from his chair and walked out on the terrace. The others followed after him.

Looking westward, they saw the mammoth craft descending slowly in their direction.

Its vast dimensions became more and more apparent as, spellbound, they watched it approach closer and closer to them.

The thing in the sky was now not more than three thousand feet above them and only a few miles to the westward.

The observers on the terrace regarded it for a moment in silence as it drifted forward and downward.

“It’s colossal!” Steinholt then exclaimed, lost in scientific admiration of the mammoth craft.

“Magnificent! Superb!”

“But it’s coming right toward us!” cried Stanton.

“What makes it move, I wonder?” asked Dirk. “And how in the world is it controlled?”

“It surely is not of this world,” said Fragoni quietly.

“That gigantic thing has come to us from somewhere out of the infinite and terrible depths of space.”

Another minute elapsed while they watched it, speechless with wonder.

“Do you know,” Lazarre then said calmly, “I believe that it is going to land in the waters of the Sound. It appears so to me, anyway.”

It was nearly opposite them by this time, and not more than a thousand feet above the water. A few planes which, very apparently, were being flown by intrepid and fearless flyers, were hovering close around it.

Then finally it came to rest, as Lazarre had predicted, in the water some two miles off shore, and it was

obscured by a great cloud of vapor for several minutes.

“Steam,” asserted Steinholt. “That trip around the world, which it made in a few minutes, generated considerable frictional heat in the shell.”

“Come,” said Fragoni, “we’ll fly out and look the thing over.”

Around the corner of the building, on the level of the terrace, there was a landing stage which was occupied by a number of planes of various sizes.

Dirk entered the door of a small twenty passenger speedster, and the others filed in after him.

“Ready?” he asked, after he had seated himself at the controls.

“Ready!” replied Fragoni.

The plane rose straight up into the air and then darted gracefully out over the Sound.

Dirk swooped straight down at the leviathan which lay so quietly on the surface of the Sound and then slowly circled around it. No sign of an aperture of any sort could be seen in the craft. Then he dropped the plane lightly on the water, close to the metallic monster, which towered fully four hundred feet above them, despite the fact that more than half of it was submerged.

“It must be hollow,” remarked Steinholt, “or it wouldn’t be so far out of the water. In fact, it most certainly would sink, if it was solid.”

At the touch of a lever which lay under one of Dirk’s hands the plane rose straight out of the water, and he maneuvered it directly over the top of the strange enigma. Then he touched a button and the pontoons were drawn up into the undercarriage of the craft.

“Shall I make a landing on it?” he asked, turning his head and addressing Fragoni.

The latter nodded his head, and Dirk dropped the ship gently onto the smooth surface of the monster, the

pneumatic gearing completely absorbing the shock of the landing.

Dirk relinquished the controls and, opening the door of the cabin, he stepped out onto the rough and pitted substance of which the leviathan was compounded. He stood there while the others came out after him.

A large area on the top of the monster was perfectly flat and, within a very few moments, Dirk discovered that it was decidedly warm. He had brought the plane down close to the middle of the length of the strange craft in the belief that there, if anywhere, some indication of an entrance might be found.

The voice of Steinholt, tense with suppressed excitement, appraised him that his surmise had been correct.

“There is a manhole of some sort,” the electrical wizard exclaimed. “And look, it is turning!”

They saw, not far ahead of them, a circular twelve-foot section of the deck slowly revolving, and, even as

they watched, it commenced to rise slowly upward as the threads with which it was provided turned gradually around.

Almost involuntarily they retreated a few feet and stood there, spellbound, as they stared at the massive, revolving section of the deck.

It continued to turn until fully ten feet of the mobile cylinder had been exposed. Then the bottom of it appeared. Even then it continued to revolve and rise on a comparatively small shaft which supported it and, at the same time, thrust it upward. Dirk and his companions kept their eyes on the rim of the well which had been exposed, and awaited the appearance of something, they knew not what. When the top of the great cylinder was fully twelve feet above the deck of the craft it slowly ceased to revolve.

Moment succeeded moment as the members of the little group rigidly and almost breathlessly awaited developments.

Then Dirk, with an impatient ejaculation, stepped

forward toward the yawning hole and cautiously peered over the edge of it.

He stood there for a moment, as if transfixed, and then, with an exclamation of horror, retreated swiftly to where his friends were standing.

“What is it?” gasped Steinholt. “What did you see when--”

But the words died on his lips for, swarming swiftly over every side of the well, there poured an array of erect, piercing-eyed beings, who had all the characteristics of humans. They were clad in tight-fitting attire of thin and pliant metal which, with the exception of their faces, shielded them from head to foot. On their heads they wore close-fitting helmets, apparently equipped with visors which could be drawn down to cover their unprepossessing features.

Each one of them carried a tube which bore a striking resemblance to a portable electric flashlight.

Swiftly they advanced, in ranks of eight, toward Dirk

and his companions who, gripped with amazement, held their positions.

The first line came to a halt not more than four feet from the little group on the deck. The other lines halted, too, and formed a great platoon. Then a shrill whistle sounded and the formation parted in the middle, leaving an open path that led backward to the entrance, to the well.

A moment later the watchers saw the regal figure of a man emerge from the orifice and, after a moment's pause, advance slowly in their direction with a stately stride.

He was tall and muscular and blond and his attire, golden in texture, glittered with sparkling gems.

As he approached them he raised his right hand and, inasmuch as his countenance was calm and benign, his gesture appeared to be one of peace and goodwill.

Following close behind him there was a younger man

who, very apparently, was of the same lineage. His expression, however, was petulant and haughty and it contained more than a suggestion of rapacity and evil.

Behind him there were others of the same fair type, all of them sumptuously and ornately attired.

Fragoni stepped forward, himself a dignified and striking figure, as the leader of the strange adventurers came forth from the lane that had been formed by his immobile guard of warriors.

The two men confronted each other, one whose power and wealth gave him a dominate position on earth, and the other a personage from some domain that was remote in the abyss of space.

Fragoni bowed and spoke a few friendly words of welcome and the stranger, to the utter amazement of the banker and his associates, responded in an English that was rather peculiar in accent but that they could understand without any difficulty.

“From what part of the world do you come,” asked

the astounded Fragoni, “that you speak our language?”

“We come from no part of this world,” replied the stranger. “The empire of my ruler is infinitely far away. But language, my friend, is not a thing of accident. Life grows out of the substance of the universe and language comes out of life. The speech of mankind, in your state of development, varies but little throughout all space and I have heard your English, as you call it, spoken among those who dwell in many, many worlds.”

“And your world?” asked Steinholt with avid curiosity. “Tell us of the planet from which you come.”

But Fragoni, smiling at the eagerness of Steinholt, interposed with a kindly but arresting gesture.

“My name is Fragoni,” he said to the stranger, “and I would have you partake, of my hospitality and refresh yourself after your long journey. These,” he added, “are my friends, Steinholt, Vanderpool and Lazarre.”

“I am Teuxical, vassal of his Supreme Highness, Malfero of Lodore,” the other replied. “This is my son, Zitlan,” he continued, indicating the young man behind him, “and the others are my high captains, Anteucan, Orzitza and Huazibar. More of my officers are below together with ten thousand armed and armored men such as you see before you.”

If the last part of the statement was intended as a threat or a warning, the expression on Fragoni’s face gave no indication that he was aware of it.

“You carry a large crew, sir,” Fragoni replied, “but we gladly will make provisions for all of your men. As for yourself, your son, and your captains, if you will come with me....”

He nodded in the direction of the plane which rested on the great interplanetary vessel and started to walk slowly in the direction of it. The leader of the skymen walked by his side and the other men from Lodore followed close after them.

Dirk, Steinholt and Lazarre brought up the rear, while

the soldiers remained motionless in their serried array.

Innumerable planes were circling overhead and hundreds of them had landed on the water in the vicinity. Dirk saw that the wanderers from the stars regarded them curiously as if they never before had seen aircraft of that particular type.

When the cabin door of the plane was thrown open, Teuxical turned to one of his captains.

“Remain here, Anteucan, with the soldiers,” he commanded, “and await our return.”

Teuxical then entered the plane with his men and Fragoni, Steinholt and Lazarre followed after them. Then Dirk took his seat at the controls.

“These are strange craft you use,” he heard Teuxical say. “I have seen them in only one of the multitude of other worlds on which I have set my feet, worlds which all pay tribute to Malfero of Lodore. It is safer and swifter to ride the magnetic currents than it is to

ride the unstable currents of the air.”

Dirk caught the significance of the reference to tribute and he admired the clever diplomacy of Teuxical while, at the same time, he wondered if the earth and all of those who dwelt upon it were doomed to fall under the sway of some remote and unseen despot.

He also realized that the Lodorians had, in some way, devised a craft that rode the great magnetic streams which flowed through the universe in much the same way that men, in ships, navigated the streams of the earth.

He threw on the helicopter switch and the plane rose swiftly into the air, the myriad other flying craft which were circling nearby keeping at a safe distance from it.

“Land on the grand terrace,” Fragoni directed. The flight was short and rapid and it was only a matter of seconds before Dirk brought the plane down on the landing stage which they had left only a scant half-

hour before.

He opened the cabin door and stepped out of the plane and the others filed out after him.

Fragoni led the way along the stage, walking and chatting with Teuxical, and Dirk, following after the others, was the last to turn a corner that brought him a sweeping view of the magnificent terrace that fronted the private apartments of the banker and his daughter.

And, when he did, he saw that Inga was standing there, superbly beautiful, with Stanton a few paces behind her.

Her lovely eyes were alive with awe and wonder and her slender white hands were crossed over her heart.

And Dirk saw, too, that Zitlan, son of Teuxical, had paused and was standing quite still, with his unwavering and insolent eyes fixed on the girl.

Resentment, and a touch of apprehension, agitated Dirk when he saw the expression on the face of the

young Lodorian.

There was admiration in that disagreeable countenance, but it was blended with arrogance, haughtiness and ill-concealed desire.

Dirk went quickly to Inga, standing between the girl and the one from Lodore who was staring at her so brazenly.

“What does it all mean, Dirk?” she asked in a low voice. “Those strange people, where are they from?”

Stanton had come quickly forward and had joined Inga and Dirk.

“They are from some far-off world, Inga,” he explained, “that we know nothing about as yet.”

“But what do they want?” she persisted. “What do they intend to do? I saw those horrible creatures through the magnascope when they came swarming out of the inside of that thing on the water and I thought, at first, that they were going to kill you all.”

“No, they seem to come in peace,” Dirk replied.
“Teuxical, their leader, seems to be gracious and kindly.”

“We are all doomed,” asserted Stanton, “unless something happens. They can crumble our cities with heat and bury us under the ruins of them.”

“Keep your silence!” breathed Dirk, quietly but tensely. “We will find a way to destroy those creatures if it becomes necessary.”

“That man who keeps staring at me, who is he?” asked Inga in a voice that betrayed her nervousness.

Dirk turned and saw that Zitlan was still standing where he had paused and that he still was looking with searching eyes in the direction of the girl.

He returned the insolent gaze of the young Lodian with an impatient and threatening stare and the countenance of Zitlan at once became stern and menacing. He came striding in the direction of Inga,

Dirk and Stanton and paused within a few feet of them, his rapacious eyes still fixed on the girl.

“My lady,” he said, “your beauty pleases me. I have walked on many worlds but never before have I seen one as lovely as yourself. Of the spoils of this world, all that I crave possession of is you. When we return to Lodore,” he added with an air of finality, “I will take you with me and place you with my other women in the Seraglio of the Stars.”

Dirk swiftly stepped close to Zitlan and the latter quickly clasped a tube that hung at his side, a tube of the sort that the soldiers had carried.

“Your words and your manner are insolent,” asserted Dirk angrily, “and I warn you now to cease making yourself offensive.”

“Dog!” exclaimed Zitlan fiercely, leveling the metal tube, “I’ll--”

But the left fist of Dirk cut short his threat as it made a sudden impact with his chin, and the Lodorian went

crashing backward into some exotic shrubbery with a look of surprise on his countenance.

Then Dirk heard an odd hissing and crackling sound, and he felt himself becoming dizzy and weak.

Darkness seemed to sweep in upon him; he felt that he was dropping swiftly through space, and then he lost consciousness.

A vague and shadowy figure was standing close by his side and peering down into his face. After a while he realized that it was Steinholt.

“Steinholt!” he gasped. “Why--why am I here--in Fragoni’s? I must have had a dream--and yet....”

He furrowed his brow in thought and, gradually, he commenced to remember what had happened.

“It was no dream,” said the scientist softly. “Do you remember the trouble that you had with Zitlan?”

“Yes,” replied Dirk. “I remember that he was insolent

to Inga and that I lost my temper and struck him. But what happened to me? I don't recall that anybody hit me. I did hear sort of a peculiar sound just before I started to pass out, but--"

"Teuxical took a shot at you," said Steinholt, "and you have been unconscious for over thirty-six hours."

"Took a shot at me!" exclaimed Dirk. "What did he shoot me with?"

"That is what we all would like to know," said Steinholt. "He leveled one of those damn tubes at you and pressed a button on it. There was a hissing sound, a flash of light, and you got groggy, and went out. He potted Zitlan, too," continued Steinholt, "and he apologized for the trouble that his son was responsible for. Do you know," he added, "I sort of like the old man."

Lazarre, with a sympathetic smile on his face, entered the room at that moment and overheard the conversation.

“Old man is right,” he remarked, with a little note of awe in his voice. “Teuxical admits that he is three thousand years old and that he has at least two thousand more ahead of him. That Lodore must be a queer world,” he commented, shaking his grizzly head.

“It is not so queer when you take everything into consideration,” said Steinholt. “It seems quite natural when Teuxical explains it. Lodore it seems, is something like a hundred thousand times as big as this miniature world we live on. It took Lodore infinitely longer to solidify from a gaseous state than it took this world, and its entire evolution has been relatively slower than ours. Therefore, according to Teuxical, the people up there live longer and, incidentally, know infinitely more than we do.”

“What time is it now?” asked Dirk, after a moment of thought.

“It is just about twelve o’clock at night,” Steinholt informed him.

“Have these Lodorians made any demands yet?” Dirk asked. “Does anybody know what they are going to do or what they want?”

“They are liable to do almost anything,” said Lazarre, “and it looks as though they will be able to get anything that they want. Teuxical, as I understand it, just gave you a slight shock with his death-ray device. If he had pulled the trigger all the way you would have become just a little pile of dust that the first breeze would have blown away.”

“Our own death-rays are somewhat similar,” said Steinholt, “but they are not a hundredth as powerful. And they won’t work on the Lodorians, either,” he added, “because those metal sheaths that they wear make them immune to all kinds of destructive rays.”

“It appears,” remarked Lazarre morosely, “as if this little world of ours is going to be taken for a ride. And it’s too bad, considering that it’s the only world we’ve got. There has been no formal presentation of demands yet, but it seems to be sort of understood that the earth is going to become a tributary of

Lodore. It is a good thing," he added, "that Teuxical, and not Zitlan, is the boss of that outfit. I don't like the looks of that young fellow. He's only twelve hundred years old and he is sort of hot-blooded, I guess."

"I was talking with Anteucan," said Steinholt, "and he told me that the Lodorians usually make heavy levies on worlds which they discover and dominate. As soon as Teuxical returns to Lodore and announces a new discovery a fleet of those damned monsters is sent out to mop up the new planet. That Malfero, who is the emperor of Lodore, is considerable of a monarch, and it seems that he has a passion for piling up wealth. Gold and platinum are as precious on Lodore as they are here and he also likes pretty stones."

"And what is worse," added Steinholt, "is his practice of enslaving entire populations and making toilers or warriors out of them. Those soldiers on the ship are not Lodorians. Millions of them were seized on some planet and converted into troops. It was a strange conversion, too," said Steinholt with a shudder. "Their brains were operated on and most of their faculties

removed. They have no sense of fear, no consciences, no power of reasoning. They respond only to certain signals on a whistle and their only definite and active impulse is that of murder and destruction.”

“There is nothing to do,” said Dirk positively, “but to kill all of these interlopers, if we hope to save our world from being desolated.”

The three men looked at each other in silence for a moment and then Dirk, somewhat weakly, rose into a sitting position in the bed which he had been occupying.

“But how,” asked Steinholt, “can we kill them? We might, of course, get rid of a few of them, but that simply would lead to our destruction by those who were left.”

“There must be some way,” asserted Dirk, “and it is up to us to think of it without delay. If we let those Lodorians get a foothold on the world all will be lost.”

“The old man seems to be reasonable enough,” said

Lazarre. "He doesn't seem inclined to be destructive."

"We must not trust him or any of the others," said Dirk imperatively. "We must rid the earth of every one of them. And the sooner we strike the better!"

"It had best be soon if it is to be at all," said Steinholt. "Fragoni has arranged to have Teuxical appear before the Congress, and the meeting has been called for to-night when, I imagine, certain specific demands will be made upon us. We all will go to The Hague together on the ship of the Lodorians."

"And we leave?" questioned Dirk.

"The meeting is set for ten P. M., New York time," said Lazarre. "We will start east at about four o'clock in the morning, I guess, because it will only take a minute or so to arrive at our destination."

"Is Fragoni going?" asked Dirk.

"Naturally," replied Lazarre.

“And Inga?”

“I believe so,” Lazarre told him. “Fragoni was both afraid to take her and to leave her behind, but finally he decided that he wanted her with him in case of trouble.”

“And are they--the Lodorians--still here?” queried Dirk.

“Yes,” responded Lazarre. “Teuxical returned to his ship last night with Zitlan and his other followers, but they came back late this afternoon, and they are still here. Zitlan seemed to be all right this afternoon, too. They must have used some means of bringing him out of the daze that he was in. We did everything we could to revive you, but none of our measures were effective.”

“I’m all right now,” asserted Dirk, as he finished attiring himself. “I want to see Fragoni at once.”

“We’ll go out on the terrace then,” said Steinholt. “They are all out there.”

Dirk, with his two companions, strolled out through the maze of rooms and corridors that led to the garden which hung so high above the city and the Sound below it.

The first thing that Dirk saw, when he passed out onto the terrace, was the white tunic of Inga, who was leaning against a coping and talking with Zitlan.

The latter was pointing skyward and, very apparently, he was telling her of worlds which circled high among the stars.

As if she were suddenly aware of his presence, Inga turned and saw Dirk and he realized, by the expression on her face, that she was distraught and nervous. She came toward him quickly, after a few words to Zitlan, and the face of the latter darkened. There was hatred in his expression as he stared malevolently at Dirk.

Steinholt and Lazarre passed along and joined Fragoni and Teuxical, who were the center of a group that had formed in another part of the terrace.

“Oh, Dirk,” said Inga, “I am so afraid of that frightful Zitlan. He has been telling me again that he is going to take me back to his own world with him and it makes me shudder to think of it. He is so strange and queer and his eyes are so terrible. He can’t be as young as he looks, because he speaks of years like we speak of minutes. I will die if I ever find myself in that monster’s power! He has been telling me of all the creatures he has slain on the worlds on which he has landed, and I tell you, Dirk, that he is cruel and ruthless and horrible.”

“He will never have you!” swore Dirk. “And if I hear of any more of his insolence, I will throw him headlong from this terrace.”

“Please, Dirk,” she begged, “don’t do anything--not yet. He is utterly unscrupulous, Dirk. He told me that, even now, he is plotting against some Malfero who rules Lodore like a god, and that he is planning to seize the throne of the planet. He wants to make me the queen of that fearful world when he becomes king. He boasted that, if I were on the throne, millions of people from other worlds would be sacrificed in my

honor in the temples of Lodore.” Her voice trembled and her eyes were terror-stricken as she continued. “They tear out the hearts of living victims,” she whispered, “and burn them on their high and mammoth pyramids.”

Rage took possession of Dirk and, casting a glance at Zitlan, he saw that the Lodian was smiling insolently at him.

“I’ll kill that beast, if it’s the last thing that I do!” he exclaimed to Inga.

“Dirk, Dirk,” she implored, “don’t even look at him. He is proud and impetuous, and he will kill you in defiance of his own father.”

“We will find some way to rid the world of the scourge that has descended upon it,” asserted Dirk confidently, “and he will die with the rest of that monstrous crew.”

“I am going in, Dirk,” Inga said. “Please,” she begged, “don’t do anything rash. If--something--should

happen to you, I would lose all the hope that I have and I would, I think, kill myself.”

“Don’t lose hope, my dear,” said Dirk reassuringly. “I believe that I know of a way to destroy the plague that menaces us.”

He pressed her hand and, after she left him, he walked over and joined the other men on the terrace. Zitlan, coming from the terrace wall, stretched out in a chair not far from Dirk.

Teuxical regarded the latter with a countenance that was calm and amicable. “I am sorry, my young friend,” he apologized, “that I had to intervene between you and my son.” He paused a moment and sat in silence, a thoughtful expression on his face. “Ah,” he then said, “what disasters have arisen out of the desire of men for women. In my wanderings over the starlit worlds, I have seen....” He ceased speaking, brooded for a moment, and then shook his head slowly. “But you cannot say that I was not just,” he continued, addressing Dirk. “I punished Zitlan for his presumption. Fragoni tells me that the woman has

pledged herself to you. Let her pledge be kept!" he exclaimed sternly, looking straight at Zitlan.

"We are the conquerors," asserted the latter boldly, "and to us should belong the spoils of our daring!"

"Silence!" thundered Teuxical. "My own son, above all others, shall be obedient to my commands! Or, like others have done, he shall die because of insubordination!"

Zitlan, a defiant expression on his face, ceased to speak, but Dirk could see that he was livid with suppressed rage.

"As I was saying," Teuxical remarked, turning to Fragoni, "I am getting old and long have I been weary of conquest. I have seen your world and it pleases me. It is a tiny and peaceful place, far removed from the strife and turbulence of the restless centers of the universe. So it is my will to leave you unscathed and return to Lodore for a brief time to ask of the mighty Malfero the grant of this little provincial land. And then, with his permission, I will return here and rule

it with wisdom and benevolence.

“I will bring to you much knowledge, and peace will be to the people of this earth and peace will be to me.”

“It is well,” replied Fragoni. “No world, I am certain, could hope for a wiser and more just ruler than yourself, and our Congress surely will receive you with acclaim.”

Teuxical bowed in recognition of the compliment, and his countenance indicated that he was gratified.

“We will go, now, back to our vessel,” he said, addressing the other Lodorians. “We will return for you at the appointed hour and conduct you to our ship,” he added, speaking to Fragoni.

“We will be ready,” Fragoni replied.

Zitlan had arisen with the rest of them and Dirk, with a look of contempt and amusement in his eyes, regarded him casually.

“May I have the honor of conducting our guests back to their ship in a plane?” Stanton requested of Fragoni.

The latter nodded and Stanton walked across the terrace in the direction of the landing stage.

Zitlan, as he followed after the others, passed close to Dirk and, pausing for a moment, fixed his hateful eyes on him.

“You dog,” he whispered malignantly, “remember what I tell you! The time will come when I will cast you to the carnaphlocti in the dark and icy caverns of sunless Tiganda. You will die,” he swore, “the death of a million agonies!”

For a moment Dirk felt an almost irresistible impulse to hurl himself on the Lodian and slay him.

He managed to maintain his control, however, and only regarded Zitlan with disdain as the latter turned and went on his way.

In another moment the plane, containing Stanton and the Lodorians, was high up in the darkness.

Dirk glanced at the great clock that gleamed atop of the beacon-tower on the Metropole Landing Field.

The hour was close to twelve-thirty A. M.

A moment of silence on the terrace followed the departure of the plane that bore the Lodorians back to their craft.

For an hour the clouds had been gathering in the sky and now a fine, cold rain commenced to fall.

A peal of thunder echoed above them after a sharp flash of lightning had streaked across the black night above them.

A servant appeared from the entrance to the apartment and pressed a button close to the door.

Protective plates of glass noiselessly enveloped the terrace, sheltering those upon it from the inclement

weather.

“It is well,” remarked Fragoni, breaking the silence, “that we were found by a leader like Teuxical. Our tribute will not be unbearable, and he will bestow many benefits upon us.”

“But surely,” protested Dirk, “you do not intend to surrender without a struggle! Nothing but disaster,” he asserted earnestly, “will come upon the earth if you do. Teuxical may be honest and just but, after all, he neither is immortal nor all-powerful, and something may happen to him at any moment. And there are those like Zitlan who would turn the world over to ravage and rape, and then convert it into a blazing pyre, if they had their way. These vandals,” he insisted, “must be slain one and all, or, mark my words, our world will be laid waste.”

Dirk spoke with such a sense of conviction that his words held his listeners spellbound.

“Who is Teuxical,” he asked, “but the vassal of a monarch whose corsairs, very apparently, are

carrying on a war of conquest in the universe? It will be disastrous, I say, to place any dependence in the good will of this one Lodian. If he, or any of his men, return to that far-off planet where they dwell word will be carried there of the existence of our world. But who can say that Teuxical ever will return here again? It may be the whim of his ruler to refuse his request, or any one of a thousand other events might arise to thwart his desire to live among us. No," concluded Dirk passionately, "it never will do to let that great engine of destruction rise into the skies again!"

"He is right!" asserted Steinholt positively. "It will be far better to annihilate these raiders, if such a thing can be accomplished!"

Lazarre was rather inclined to take sides with Fragoni.

"But how," he demanded, "can such destruction be brought about? We know nothing of the capabilities of that monster that is lying down there in the Sound. It is undoubtedly equipped with the deadliest of devices

and they all will be turned upon us if we fail in an effort to destroy the thing and those who have come from space upon it. If there was a way to smite them suddenly, to bring death to the Lodorians and to those swarming, mindless, murderous minions who act in obedience to them, I would favor doing it.

“But, as it is,” he concluded, “it seems like inviting disaster even to think of such an attempt, much less to try it.”

“It can be done, though,” asserted Dirk, “or there is at least a fighting chance of accomplishing it. The electrosceotan--” He paused, and looked questioningly at Steinholt. “The top of that monster is open and....”

The Teuton furrowed his brow and considered the proposition for a moment.

“Yes,” he said, nodding his head, “it might be done.” Again he silently gave the subject his thought. “It is well worth trying,” he asserted with an air of decision. “But we will have to make haste,” he

warned, "if the thing is to be done before the flight to The Hague."

"So be it," said Fragoni. "We will apply ourselves to the task at hand. I, too," he confessed, "had rather see these vandals destroyed like so much vermin rather than have them carry the news of the existence of this earth back into those strange worlds in the depth of space. I will only regret the passing of Teuxical, who could have taught us much wisdom. And now," he continued briskly, "I will place myself under your orders, Dirk. You are the one who suggested this plan and upon you will fall the responsibility of executing it. And, if it succeeds," he added, "the glory will be yours."

"I care little for the glory," replied Dirk, "but I gladly accept the duties and the responsibilities. These," he said to Fragoni, "are my instructions to you.

Inasmuch as Teuxical and his captains will return here at about four o'clock in the morning to convey us back to their craft, it will be necessary to have this building emptied of its inhabitants by that time. Let all of those who dwell here depart from it, a few at a

time, so as not to excite suspicion. Inga, above all others, must leave and retreat to a place of safety. Then, as the hour approaches for the arrival of the Lodorians, we will escape by plane from one of the rear terraces. They will land in search of us and--well, then they will feel the force of our power."

"I will follow your orders explicitly," promised Fragoni. "I wonder," he added, "where Stanton is? He should be advised of what we are going to attempt."

"He will return in due time," replied Dirk. "And, if not, it will be the worse for him. Lazarre will remain here with you," he then told Fragoni, "and Steinholt and I will now go about our part of the task at hand."

Dirk, followed by Steinholt, hurried across the terrace and, leaving the shelter of its quartzite plates, sought the landing stage.

The rain still was falling and the heavens were congested with dark and heavy clouds.

Dirk, selecting one of the smaller planes, entered the

cabin and Steinholt, following after him, closed the door and threw on the lights.

Swiftly they shot straight up into the air, Dirk ignoring all of the rules of flight in his haste to be under way. Once in the westbound lane, he headed his plane toward Manhattan and threw his rheostat wide open. In a few minutes they were skimming over the great city and past the three-thousand-foot steel tower of the Worldwide Broadcasting Station.

For fifteen minutes more he kept the plane on a straight course and then, bringing it to a quick stop, he let it drop like a plummet toward the earth.

It landed, among many other planes, on the transparent, quartzite roof of a vast building and, looking down into the interior, they could see several rows of great dynamos. Some of them were turning, and the humming that they made could be heard plainly.

Dirk and Steinholt ran rapidly across the roof until they came to a superstructure, which they entered.

There was a shaft inside. Dirk pressed a button, and an elevator shot up and stopped at the door, which automatically flashed open.

He closed it after he and his companion had entered the cage and, dropping rapidly downward, they came to a stop in a lighted chamber that was far below the surface of the ground.

A stoop-shouldered old man greeted them, an expression of surprise on his face.

“Gentlemen!” he exclaimed. “What is--”

“Power, Gaeble!” commanded Steinholt tensely.

“Power! Let every dynamo run its swiftest. To-night we have to use for the electrosceotan!”

“But I thought it was peace that those from the stars desired,” said the old electrician. “Through my radiovisor I heard--”

“That was sent out,” explained Steinholt, “to relieve the fears of the people and to keep them in order.”

Swiftly the distorted figure of the old man sped to a great switchboard, where he pressed button after button.

The very ground commenced to vibrate around them and the massive structure seemed to be alive with straining power.

Then Steinholt, going to a corner of the intricate board, adjusted a few levers, while his gnomelike companion watched him carefully.

“And now, Gaeble,” the scientist said impressively, “these are your orders. At precisely the hour of four o’clock in the morning make one connection with this switch.”

He indicated, with a stubby finger, the lever to be operated.

“Keep the circuit closed for just four seconds,” he added slowly, “and then break it. Do you understand, Gaeble?” he demanded.

“I do,” replied the old man.

“Then,” continued Steinholt, “after you break that connection you quickly will close this next circuit. Keep it closed for four seconds and then, after opening it for one second, close it again for four seconds. Repeat the procedure twice more, Gaeble, after that, and then await my further instructions. Is everything clear?” he asked.

“It is, sir,” the old man replied. “I will follow your orders implicitly.”

“There is one thing more,” Steinholt said. “Get the Worldwide Tower on the televisor and warn them of what is to happen.”

“I will do that immediately,” Gaeble replied.

Dirk and Steinholt shot up to the roof again and the building over which they walked seemed to be quivering with life.

They could see that all of the mammoth dynamos

beneath them were revolving and the humming which they had heard before had changed into an ugly, vibrant roar.

Again they took flight and, reaching Manhattan, they continued north and east to the shore of Long Island Sound.

Long before the old East River had been filled in and the space which it had occupied reclaimed for building purposes. All indications of its former bed had been obliterated by mammoth terraced structures.

When they reached their destination on the shore of the Sound a small submarine, which Dirk had ordered by radio, was awaiting them.

“Submerge and proceed up the Sound,” Dirk ordered the officer, “and take us directly under the craft of the Lodorians.”

In a few minutes they were skimming over the surface of the water and, when a sufficient depth had been

gained, the tiny boat disappeared beneath the rain-rippled sea.

Dirk sat at a port and watched the aquatic life as it was illuminated by the powerful aquamarine searchlights.

Progress under the water was comparatively slow, as mankind had made but little progress in underwater navigation. Air liners long before had almost superseded travel by land and sea and the abolition of warfare had swept all of the old navies from the ocean.

It was more than an hour before the officer in charge of the boat announced that the mammoth hull of the monster that was lying on the Sound was visible directly above them.

Both Dirk and Steinholt donned diving apparatus, and the former carefully adjusted the mechanism that was contained in a metallic box about two feet square.

Then they stepped up into a chamber in the conning

tower of the boat and, after a door slipped shut beneath them, water slowly commenced to pour into the compartment.

When it was full a sliding door that was in front of them slowly opened and they passed out onto the deck of the underwater craft.

Steinholt had been provided with some welding apparatus and, in a few minutes, the box which Dirk had carried was attached securely to the bottom of the craft of the Lodorians.

They then reentered the submarine by reversing the process which had attended their exit. Very soon they were in the cabin of the boat again.

“If everything goes well,” said Dirk, “those damned Lodorians will never know what struck them.”

“I only hope,” said Steinholt, “that we don’t destroy that leviathan altogether. We might solve the secret of it and then we, too, could ride out into the heart of the universe.”

“It is impossible to imagine what will happen,” Dirk replied, “until after we launch our attack.”

Both of the men were silent during the return trip of the small undersea craft, which emerged at its dock a little before three-thirty in the morning.

“We’ll have to hurry,” urged Dirk nervously, “because we will need a little time to make preparations after we get back to Fragoni’s.”

They entered their plane and Dirk shot it swiftly up into the night, following the red shaft of light that rose almost directly from the point at which they had made their landing.

Then, having reached the eastbound level, he headed straight in the direction of the palace of Fragoni.

Dirk cast a glance at the great city that lay far beneath him. High up into the heavens it tossed the fulgurant fires that betokened its wealth and power. And, down among those myriad lights, millions and millions of people were restless under the danger that

menaced them. It was only a matter of moments now before their fate, and the fate of their great metropolis, would be decided. By dawn they would be free forever from the threat of subjugation and slavery or else they, and all that they had toiled and striven for, would be the veriest dust of dying embers.

And whatever befell them likewise would befall the rest of the world and every living thing that moved upon it.

Dirk was high above Fragoni's when he stopped the forward flight of the plane and, dropping it rapidly through the misty night, brought up easily on the landing stage. The other planes which had been there when he and Steinholt had taken their departure were gone and Dirk felt a sense of relief when he observed this. Inga, then, must have departed with the other occupants of the colossal structure. Things were going according to the plan that he had conceived. He stepped out of the cabin, followed by Steinholt, and proceeded hastily along the terrace and turned the corner into the garden.

Then he came to an abrupt halt because there, before him, was Zitlan, with one of the deadly ray-tubes of the Lodorians in his hand.

Dirk knew immediately that something unexpected had happened and that he was in the power of one who not only hated him but who had an unholy desire for Inga.

He realized, too, that any show of resistance would be nothing short of suicide, for he was well aware of the deadliness of the strange weapon with which he and Steinholt were being menaced by the gloating Lodian.

“One false move and you die!” warned Zitlan. “Come forward, now, and join those two others over whom Anteucan and Huazibar are watching.”

Dirk and Steinholt promptly obeyed the command of Zitlan and walked over to where Fragoni and Lazarre were being guarded by two of the conquerors.

The rain had ceased to fall, but the skies were dark

and overcast with heavy clouds. There was an occasional flash of lightning, and thunder rolled and echoed through the night.

The terrace, however, was brightly illuminated and every detail of the scene around him was visible to Dirk.

He saw Stanton, on another part of the terrace, standing among some Lodorians he had not seen before. Stanton, apparently, was not being treated as a prisoner and Dirk wondered, rather vaguely, why this was.

“What happened?” Dirk asked Fragoni quietly.

“According to what I have heard,” the latter replied, “Zitlan murdered his father in a fit of rage, and has taken over the command of the ship. Many of the Lodorians are his adherents and even those who do not favor him are so terrified that they will be obedient to his wishes.”

“And Inga?” questioned Dirk.

“She is inside the apartment,” said Fragoni, a note of desperation in his voice. “Zitlan surprised us completely and he and his men had us covered before we realized that Teuxical was not among them.”

Zitlan, in the meantime, had entered the suite of Fragoni and he now came out, Inga walking before him.

She was silent and proudly erect but there was a pallor in her face that indicated her realization of the danger that she was threatened with.

When Dirk saw her she gave him a brave smile, which he answered with a glance of reassurance.

He could see the great clock in the Metropole Tower, and he noticed, with a feeling of grave apprehension, that it was twenty minutes to four o'clock.

There were only a few minutes more in which to make a desperate and apparently a hopeless effort to save Inga, his friends and himself from a catastrophe which he had been instrumental in contriving.

Then Zitlan stood before him, haughty and arrogant, his lowering countenance ugly with hatred.

“So, dog,” he said, “you who dared to defy Zitlan now stand before him a captive!”

Neither Dirk nor any one of the three others who were guarded with him replied to the utterance.

“You and that woman of yours,” continued the Lodorian insolently, “both are my prisoners to do with as I please. Your fate,” he continued, “I already have planned for you and I assure you that it will not be as pleasurable as the one to which she is destined. You will find that Tigana, on which you and those with you will be cast, is a world of terror such as you never could dream of. Even the monsters which crawl through the deliriums of the mind are not as horrible as those which infest the mad and haunted world of which I speak.”

He paused a moment, a cruel smile on his face, as if he wished the full import of his words to sear themselves into the minds of the doomed men.

“But the woman,” he added, “will return to Lodore with me and be the queen of all women. And soon,” he said savagely, “she may be queen of all Lodore, of the worlds which pay tribute to Lodore, and of other worlds which I will conquer and ravage. My father stood in my way and he died at my own hands. So will others perish who thwart my ambition, and I will become supreme in the universe!”

A feeling of reckless fury possessed Dirk as he listened to the words of Zitlan and he felt an almost irresistible desire to drive a fist square between the mad, glittering eyes of the Lodian.

He glanced at the great clock, however, and he saw that the time to act had not yet come. At the last moment he would make one desperate attempt to frustrate the evil designs of Zitlan. If it failed--well, all would be lost. But it was a far better thing to die resisting the despicable Zitlan and his minions than it would be to live and to know that, without a struggle, he had abandoned to degradation the girl he loved.

“This world of yours will be my world,” he heard

Zitlan boast, "and the spoils from it will add to my riches. This one here," he continued, indicating Stanton, "has offered to show me where all of the treasures of the earth may be found. And, as a reward, he will return to Lodore with me and there be elevated to a high position."

That, then, was why Stanton was not under guard like the rest of them.

"Our good friend, Stanton," said Lazarre, "seems to have become something of a Judas."

"And let his name be forever cursed, like the name of Judas," said Dirk.

"Silence!" thundered the Lodian. "I, Zitlan, am speaking." He paused a moment. "When I garner up the treasures of this world in the way of precious stones and metals I also shall gather more priceless loot in the way of women. And then, having taken all that I desire, I will lay waste to this earth so that those who survive will fear the name of Zitlan and will grovel before him like a god when once again he

appears to them.”

While Zitlan had been speaking, Dirk had been studying the opponents with whom he soon had to clash.

The two Lodorians who were standing guard over himself and his companions were close to his left side. Zitlan was directly in front of him, and there were seven of his minions clustered behind him.

Again Dirk glanced at the great dial of the clock, and he saw that it was seven minutes of four.

The moment had come to act if action was to prove of any avail.

“I will--”

But the words of Zitlan were interrupted by Dirk, who suddenly made a mighty sweep with his left arm and knocked the deadly tubes from the hands of Anteucan and Huazibar. Startled by the assault, they went reeling backward. At almost the same instant Dirk

leaped forward and, seizing Zitlan, hurled him among those Lodorians who had been massed behind him. Then he threw himself violently into the tangled mass, his fists driving in and out with deadly strength!

Out of the corner of one eye he saw Inga pass the melee and dart swiftly to the corner of the terrace. Instead of passing around to the landing stage, however, she lingered there and watched the combat.

Dirk, as he fought, became conscious that Steinholt and Fragoni were at his side, battling with him against his enemies. He saw, too, that Stanton had retired to the far end of the terrace and that he was watching the struggle with frightened eyes.

“We must reach the plane and get away,” gasped Dirk. “In another three minutes--”

He felled a Lodian who, having lost his tube, was about to grapple with him. He saw Steinholt send another one of their opponents reeling backward.

“Fragoni!” he exclaimed. “The plane! Get in with

Inga! We will come!”

Even as he spoke his fists were flailing back and forth between each one of his staccato commands.

He saw beneath him a hand reaching toward a tube, and he kicked the instrument of death. It hurtled over in the direction of Stanton and landed close to his feet. Stanton might have picked it up and been in possession of the means of aiding his old friends or his new allies. But he shrunk away, panic-stricken, from the thing that lay so close to his reach.

A Lodian leaped upon Dirk’s back in an effort to bring him to the ground, but he stooped swiftly forward and his assailant was catapulted over his head into those who were in front of him.

He caught a flash of the contorted face of Zitlan flying through the air, and saw him land with a crash on the terrace, and lie there writhing in pain.

“Steinholt, Lazarre!” he said convulsively. “We’ve got to strike once more! And then--run!”

He plunged into their enemies with every bit of energy that he had left, and saw two of them toppling down. Then, like a flash, he turned to Lazarre, who was trying to fight off three of the Lodorians. Seizing one of them by the waist, Dirk hurled him backward and he disposed of another one in the same manner. His sheer desperation seemed to have given him unbounded strength and power.

Lazarre sent his third opponent down with a blow under the chin and then, with Dirk at his side, they turned to the assistance of Steinholt.

With one mad rush they crashed into a group of Lodorians and sent them reeling away like so many nine-pins.

“Now! To the plane!” exclaimed Dirk, taking to his heels across the terrace. Steinholt and Lazarre followed after him and, turning the corner, they saw that the ship was in place and that Fragoni was anxiously waiting by the door of the cabin. Inga, Dirk knew, already was inside and safe. He stood aside while Steinholt and Lazarre leaped in. During the

momentary wait he caught a glimpse of the great clock. It was one minute to four. Dirk jumping into the plane and switched on the helicopter without even waiting to close the cabin door.

The ship shot skyward like a rocket. When it reached an altitude of thirty-five hundred feet, he turned it north and raced at top speed in that direction.

It was miles away from the palace of Fragoni in less than thirty seconds. Dirk then stopped the plane and held it poised in the air with the helicopter.

The skies were turgid and black and the massed clouds, reflecting the lights of the great city below them, were permeated with an ugly, feverish, red glow.

From where they were hanging in midair, the occupants of the plane could plainly see the sparkling palace of Fragoni towering high up into the darkness of the night.

The lights of the magnificent mansion were reflected

far out into the Sound where, looming in the golden ripples, lay the sinister monster from the terrible depths of unfathomable space.

Dirk took a watch from his pocket and, after glancing at it, he hastily replaced it.

“Two seconds more,” he said, “and--”

A sharp and dazzling bolt of greenish fire came hurling suddenly out of the west and, with a thunderous concussion, seemed to fasten itself on the crest of Fragoni’s palace.

It trembled and quivered, as if endowed with some uncanny life and power, as it remained there against the darkness, throwing a weird, green tinge over the water and up into the skies.

Blue waves of light could be seen pulsing and racing along the terrible beam and there, where it had fastened itself, they seemed to disappear in the vast and crumbling structure.

For four seconds that destructive streak of light, one end of which was lost back in the mists that concealed Manhattan, tore at the proud pile.

And, as the stone crumbled and the steelite fused under the mighty assault, an ominous roar swept through the night. The air was so violently agitated that the plane, miles away, tossed up and down like a tiny boat on a stormy sea.

Then suddenly the bolt was gone, but its livid image still burned in the eyes of those who had been watching it.

Once more, it came hurling out of the west and, like the fang of some great and deadly serpent, darted into the monster that lay in the waters of the Sound.

Dirk and his companions could see plainly, by the light of the bolt itself, that it had crashed into the well from which the Lodorians first had appeared, and that it was beating and hammering its way into the very vitals of the craft.

Dazzling, blinding fire seemed to pour from the aperture through which the bolt had passed. The clamor that arose was deafening.

Then again the streak of fires was withdrawn, leaving the night intensely black until, in a moment more, it came thundering out of the west again and, with an impact that made the land and the sea and the very heavens tremble, hurled its way into the depths of the doomed leviathan.

Twice again it fell, a fiery scimitar out of the darkness, and twice again it careened at the vitals of the stricken monster.

Then, after the assault was over, the ship still floated on the surface of the Sound and its shell, as far as Dirk and the others could judge, still was unscathed.

“We will soon know our fate,” remarked Steinholt calmly. “If that didn’t kill those beasts we might as well give up our ghosts.”

“I’ll drop the plane a little lower and a little nearer to

the ship,” said Dirk. “I don’t believe that any life is surviving in that thing.”

“My beautiful palace is nothing but dust,” sighed Fragoni, mournfully. “And all my beautiful treasures, too.”

“And that beautiful Zitlan,” Lazarre reminded him, “and his beautiful boy friends, they are all dust too, thank God!”

“It was a queer fate that Stanton met,” suggested Dirk. “He thought that he would save his life by going over to our enemies, and, instead of that, he lost it.”

“Poor Stanton,” said Steinholt. “He was born that way, I suppose, and I, for one, am ready to forgive and forget him. And now,” continued the Teuton, “I hope that we didn’t do too much damage to that little boat of the Lodorians. If we could get just a little peep at the inside of it we might learn the secret of its contrivance. And then, my friends, we could do a little journeying ourselves.”

“Have you any theory regarding it?” asked Fragoni.

“Teuxical intimated that it rode the magnetic currents which, of course, flow through all the suns and planets in the universe,” replied Steinholt. “We have been working along that line ourselves, of course, and it probably won’t be very long anyway before we have the solution of interplanetary travel.”

“Those Lodorians would have solved it for us if it hadn’t been for that artificial lightning,” said Lazarre. “That’s powerful stuff, Steinholt.”

“Yes, with that three-thousand-foot Worldwide Tower to hurl it from,” agreed Steinholt, “we can get fair range with it. If the Lodorians hadn’t left the well of their ship open, though, the lightning wouldn’t have done us much good. I was afraid, too, for a time, that we might have trouble in welding that automatic wireless circuit box to the bottom of the ship.”

Dirk, in the meantime, had brought the plane down to within a half-mile of the leviathan, and he was holding it poised there.

“It seems to me,” he said, after scrutinizing the monster for a couple of minutes, “that it is moving in the water. It is!” he exclaimed. “Steinholt! Look!”

Only a comparatively short time had elapsed since the last bolt of lightning had vanished back into the darkness.

“It is still rocking with the force of the shock that we gave it,” asserted Steinholt. “You would be rocking, too, if you had been tickled by a bolt like that one.”

“It is rising, I tell you!” said Dirk. “The front end of it is slowly getting higher in the water!”

“You’re right, Dirk,” said Fragoni, excitement straining his voice. “Look! It just dropped back into the water!”

Then, as they watched, the movements of the leviathan became more and more agitated, until it was churning up the waves around it like a wounded and agonized monster of the sea.

Suddenly the front end tilted upward and the monster rose clear of the water. It shot straight up into the air at a speed so terrific that they could scarcely follow it.

“It’s gone!” gasped Fragoni. “Those brainless, mindless automatons must have survived!”

“No,” remarked Steinholt thoughtfully. “I don’t believe that there is any life left on that thing. No one had closed the well when it rose, and it would mean death to go out into space with the ship in that condition.”

“Then what made it go up?” demanded Lazarre. “Can the damn thing run itself, Steinholt?”

“I imagine,” recalled the Teuton, “that our bolts killed every living thing that was on the craft but that, at the same time, they set the mechanism of the monster into action. Ah,” he moaned, “but that is too bad. We could have learned much by an examination of the interior of that liner of the air.”

A cry from Inga startled them and they saw that she

was looking skyward, with terror in her eyes.

They followed her gaze and there, streaking through the black clouds, they saw a long trail of white fire.

“It’s that thing!” exclaimed Fragoni. “I tell you that those upon it still live and that they are about to wreak vengeance upon us.”

“No,” said Steinholt positively. “You are wrong, Fragoni. What is happening may be almost as disastrous, though,” he admitted. “That leviathan is in its death agonies; it is a metal monster gone mad, and none can say what will happen before it expires.”

“The place for us,” asserted Dirk hurriedly, “is in the Worldwide Tower. here we can keep track of what is transpiring and try to decide what to do.”

The others agreed with him and, seeking the westward level of flight, he sped the plane in the direction of the mammoth pyramid from which the news of the world was broadcast.

They reached the vast structure in a few minutes, and, after dropping the plane on a landing stage, they went into the operating room.

Here they learned quickly that the craft of the Lodorians was doing incalculable damage, and that it was throwing the population of the world into an unprecedented panic.

It was, apparently, following an erratic, uncertain orbit that took it far out into space and then back quite close to the surface of the earth again.

It had passed through the very heart of Chicago within a few yards of the ground, and it had cut and burned a swath more than a mile wide through the buildings of that metropolis.

Other cities in America had felt the devastating effects of its irresistible and molten heat and, within a short time, thousands of people had been slain by it.

Time and again, from the terrace of the great tower, Dirk and his companions saw the skies above them

light up as that terrible, blazing, projectile which, uncontrolled, went hurtling on its way through the night.

For three hours it careened on its mad course and hysteria reigned throughout the cities of the whole civilized world.

But then a report came from a rocket-liner that had left Berlin en route for San Francisco.

“Either a great meteor or that leviathan of the Lodorians just swept down past us in mid-Atlantic and plunged into the sea. Apparently it has exploded, for it has thrown a great column of water for miles up into the air. We are stopping and standing by, although the heat is intense and clouds of steam are rising from the sea.”

As the minutes passed by after the report from the rocket-ship had been received, the disappearance from the sky of the flaming craft from space seemed to confirm the belief that it had been swallowed by the ocean. This was accepted as a certainty by eight

o'clock in the morning.

"Ah," sighed Steinholt, "if only it had crashed on land somewhere. If there only was enough of it left for us to--"

"Enough of any damn contraption of that kind," swore Lazarre fervently, "is altogether too much. I hope, for one, that its fragments are scattered so far that we never can put them together again."

Dirk and Inga leaned against one of the parapets that evening on a gardened terrace of his own great mansion in Manhattan.

Their little party had gone there after leaving the Worldwide Tower in the morning.

After resting during the day, Lazarre and Fragoni were somewhere together, discussing the plans for a new palace to take the place of the one that was destroyed so that Zitlan and his minions might die in its ruins.

Steinholt, elsewhere, was delving into oceanography and submarine engineering, in an attempt to learn whether or not it would be feasible to fish for the remains of the lost ship of Lodore.

“It seems like a dream, doesn’t it, Dirk?” the girl remarked. “It is difficult to believe that we actually have seen and talked with people from some far-away world.”

Together they looked up into the crystalline skies, where mazes of shining stars gave testimony to the countless worlds which were wheeling around them.

“And just to think, Dirk,” Inga continued proudly, “that it was you who saved this world and all of its people from that horrible Zitlan and his horde.”

“I saved you,” he told her gravely and tenderly, “and that somehow means more to me than saving all of this world and all of the other worlds which are rolling through the uncharted ways of time and space.”

April 1930

#20 The Man Who Was Dead, By Thomas Holt Knight:

As Jerry's eyes fell on the creature's head, he shuddered—for the face was nothing but bone, with dull-brown skin stretched taut over it. A skeleton that was alive!

Aproximate word count:

Bigotry:

Warnings:

- - -

It was a wicked night, the night I met the man who had died. A bitter, heart-numbing night of weird, shrieking wind and flying snow. A few black hours I will never forget.

"Well, Jerry, lad!" my mother said to me as I pushed

back from the table and started for my sheepskin coat and the lantern in the corner of the room. "Surely you're not going out a night like this? Goodness gracious, Jerry, it's not fit!"

"Can't help it, Mother," I replied. "Got to go. You've never seen me miss a Saturday night yet, have you now?"

"No. But then I've never seen a night like this for years either. Jerry, I'm really afraid. You may freeze before you even get as far as—"

"Ah, come now, Mother," I argued. "They'd guy me to death if I didn't sit in with the gang to-night. They'd chaff me because it was too cold for me to get out. But I'm no pampered sissy, you know, and I want to see—"

"Yes," she retorted bitingly, "I know. You want to go and bask in that elegant company. Our stove's just as good as the one down at that dirty old store," continued my persistent and anxious parent, "and it's certainly not very flattering to think that you leave us

on a night like this to—Who'll be there, anyway?"

"Oh, the usual five or six I suppose," I answered as I adjusted the wick of my lantern, hearing as I did the snarl and cut of the wind through the evergreens in the yard.

"That black-whiskered sphinx, Hammersly, will he be there?"

"Yes, he'll be there, I'm pretty sure."

"Hm-m!" she exclaimed, her expression now carrying all the contempt for my judgment and taste she intended it should. "Button your coat up good around your neck, then, if you must go to see your precious Hammersly and the rest of them. Have you ever heard that man say anything yet? Does he speak at all, Jerry?" Then her gentle mind, not at all accustomed to hard thoughts or contemptuous remarks, quickly changed. "Funny thing about that fellow," she mused. "He's got something on his mind. Don't you think so, Jerry?"

"Y-es, yes I do. And I've often wondered what it could be. He certainly's a queer stick. Got to admit that. Always brooding. Good fellow all right, and, for a 'sphinx' as you call him, likable. But I wonder what is eating him?"

"What do you suppose it could be, Jerry boy?" questioned Mother following me to the door, the woman of her now completely forgetting her recent criticisms and, perhaps, the rough night her son was about to step into. "Do you suppose the poor chap has a—a—broken heart, or something like that? A girl somewhere who jilted him? Or maybe he loves someone he has no right to!" she finished excitedly, the plates in her hand rattling.

"Maybe it's worse than that," I ventured. "P'r'aps—I've no right to say it—but p'r'aps, and I've often thought it, there's a killing he wants to forget, and can't!"

I heard my mother's sharp little "Oh!" as I shut the door behind me and the warmth and comfort of the room away. Outside it was worse than the whistle of

the wind through the trees had led me to expect. Black as pitch it was, and as cold as blazes. For the first moment or two, though, I liked the feel of the challenge of the night and the racing elements, was even a little glad I had added to the dare of the blackness the thought of Hammersly and his "killing." But I had not gone far before I was wishing I did not have to save my face by putting in an appearance at the store that night.

Every Saturday night, with the cows comfortable in their warm barn, and my own supper over, I was in the habit of taking my place on the keg or box behind the red-hot stove in Pruett's store. To-night all the snow was being hurled clear of the fields to block the roads full between the old, zigzag fences. The wind met me in great pushing gusts, and while it flung itself at me I would hang against it, snow to my knees, until the blow had gone along, when I could plunge forward again. I was glad when I saw the lights of the store, glad when I was inside.

They met me with mock applause for my pluck in facing the night, but for all their sham flattery I was

pleased I had come, proud, I must admit, that I had been able to plough my heavy way through the drifts to reach them. I saw at a glance that my friends were all there, and I saw too that there was a strange man present.

A very tall man he was, gaunt and awkward as he leaned into the angle of the two counters, his back to a dusty show-case. He attracted my attention at once. Not merely because he appeared so long and pointed and skinny, but because, of all ridiculous things in that frozen country, he wore a hard derby hat! If he had not been such a queer character it would have been laughable, but as it was it was—creepy. For the man beneath that hard hat was about as queer a looking character as I have ever seen. I supposed he was a visitor at the store, or a friend of one of my friends, and that in a little while I would be introduced. But I was not.

I took my place in behind the stove, feeling at once, though I am far from being unsociable usually, that the man was an intruder and would spoil the evening. But despite his cold, dampening presence we were

soon at it, hammer and tongs, discussing the things that are discussed behind hospitable stoves in country stores on bad nights. But I could never lose sight of the fact that the stranger standing there, silent as the grave, was, to say the least, a queer one. Before long I was sure he was no friend or guest of anyone there, and that he not only cast a pall over me but over all of us. I did not like it, nor did I like him. Perhaps it would have been just as well after all, I thought, had I heeded my mother and stayed home.

Jed Counsell was the one who, innocently enough, started the thing that changed the evening, that had begun so badly, into a nightmare.

"Jerry," he said, leaning across to me, "thinkin' of you s'afternoon. Readin' an article about reincarnation. Remember we were arguin' it last week? Well, this guy, whoever he was I've forgot, believes in it. Says it's so. That people *do* come back." With this opening shot Jed sat back to await my answer. I liked these arguments and I liked to bear my share in them, but now, instead of immediately answering the challenge, I looked around to see if any other of our circle were

going to answer Jed. Then, deciding it was up to me, I shrugged off the strange feeling the man in the corner had cast over me, and prepared to view my opinions.

"That's just that fellow's belief, Jed," I said. "And just as he's got his so have I mine. And on this subject at least I claim my opinion is as good as anybody's." I was just getting nicely started, and a little forgetting my distaste for the man in the corner, when the fellow himself interrupted. He left his leaning place, and came creaking across the floor to our circle around the store. I say he came "creaking" for as he came he did creak. "Shoes," I naturally, almost unconsciously decided, though the crazy notion was in my mind that the cracking I heard did sound like bones and joints and sinews badly in need of oil. The stranger sat his groaning self down among us, on a board lying across a nail keg and an old chair. Only from the corner of my eye did I see his movement, being friendly enough, despite my dislike, not to allow too marked notice of his attempt to be sociable seem inhospitable on my part. I was about to start again with my

argument when Seth Spears, sitting closest to the newcomer, deliberately got up from the bench and went to the counter, telling Pruett as he went that he had to have some sugar. It was all a farce, a pretext, I knew. I've known Seth for years and had never known him before to take upon himself the buying for his wife's kitchen. Seth simply would not sit beside the man.

At that I could keep my eyes from the stranger no longer, and the next moment I felt my heart turn over within me, then lie still. I have seen "walking skeletons" in circuses, but never such a man as the one who was then sitting at my right hand. Those side-show men were just lean in comparison to the fellow who had invaded our Saturday night club. His thighs and his legs and his knees, sticking sharply into his trousers, looked like pieces of inch board. His shoulders and his chest seemed as flat and as sharp as his legs. The sight of the man shocked me. I sprang to my feet thoroughly frightened. I could not see much of his face, sitting there in the dark as he was with his back to the yellow light, but I could make out

enough of it to know that it was in keeping with the rest of him.

In a moment or two, realizing my childishness, I had fought down my fear and, pretending that a scorching of my leg had caused my hurried movement, I sat down again. None of the others said a word, each waiting for me to continue and to break the embarrassing silence. Hammersly, black-whiskered, the "sphinx" as my mother had called him, watched me closely. Hating myself not a little bit for actually being the sissy I had boasted I was not, I spoke hurriedly, loudly, to cover my confusion.

"No sir, Jed!" I said, taking up my argument. "When a man's dead, he's dead! There's no bringing him back like that highbrow claimed. The old heart may be only hitting about once in every hundred times, and if they catch it right at the last stroke they may bring it back then, but once she's stopped, Jed, she's stopped for good. Once the pulse has gone, and life has flickered out, it's out. And it doesn't come back in any form at all, not in this world!"

I was glad when I had said it, thereby asserting myself and downing my foolish fear of the man whose eyes I felt burning into me. I did not turn to look at him but all the while I felt his gimlety eyes digging into my brain.

Then he spoke. And though he sat right next to me his voice sounded like a moan from afar off. It was the first time we had heard this thing that once may have been a voice and that now sounded like a groan from a closely nailed coffin. He reached a hand toward my knee to enforce his words, but I jerked away.

"So you don't believe a man can come back from the grave, eh?" he grated. "Believe that once a man's heart is stilled it's stopped for good, eh? Well, you're all wrong, sonny. All wrong! You believe these things. I *know* them!"

His interference, his condescension, his whole hatefulness angered me. I could now no longer control my feeling. "Oh! You *know*, do you?" I sneered. "On such a subject as this you're entitled to *know*, are you? Don't make me laugh!" I finished

insultingly. I was aroused. And I'm a big fellow, with no reason to fear ordinary men.

"Yes, I know!" came back his echoing, scratching voice.

"How do you know? Maybe you've been—?"

"Yes, I have!" he answered, his voice breaking to a squeak. "Take a good look at me, gentlemen. A good look." He knew now that he held the center of the stage, that the moment was his. Slowly he raised an arm to remove that ridiculous hat. Again I jumped to my feet. For as his coat sleeve slipped down his forearm I saw nothing but bone supporting his hand. And the hand that then bared his head was a skeleton hand! Slowly the hat was lifted, but as quickly as light six able-bodied men were on their feet and half way to the door before we realized the cowardliness of it. We forced ourselves back inside the store very slowly, all of us rather ashamed of our ridiculous and childlike fear.

But it was all enough to make the blood curdle, with

that live, dead thing sitting there by our fire. His face and skull were nothing but bone, the eyes deeply sunk into their sockets, the dull-brown skin like parchment in its tautness, drawn and shriveled down onto the nose and jaw. There were no cheeks. Just hollows. The mouth was a sharp slit beneath the flat nose. He was hideous.

"Come back and I'll tell you my yarn," he mocked, the slit that was his mouth opening a little to show us the empty, blackened gums. "I've been dead once," he went on, getting a lot of satisfaction from the weirdness of the lie and from our fear, "and *I* came back. Come and sit down and I'll explain why I'm this living skeleton."

We came back slowly, and as I did I slipped my hand into my outside pocket where I had a revolver. I put my finger in on the trigger and got ready to use the vicious little thing. I was on edge and torn to pieces completely by the sight of the man, and I doubt not that had he made a move towards me my frayed nerves would have plugged him full of lead. I eyed my friends. They were in no better way than was I. Fright

and horror stood on each face. Hammersly was worst. His hands were twitching, his eyes were like bright glass, his face bleached and drawn.

"I've quite a yarn to tell," went on the skeleton in his awful voice. "I've had quite a life. A full life. I've taken my fun and my pleasure wherever I could. Maybe you'll call me selfish and greedy, but I always used to believe that a man only passed this way once. Just like you believe," he nodded to me, his neck muscles and jaws creaking. "Six years ago I came up into this country and got a job on a farm," he went on, settling into his story. "Just an ordinary job. But I liked it because the farmer had a pretty little daughter of about sixteen or seventeen and as easy as could be. You may not believe it, but you can still find dames green enough to fall for the right story.

"This one did. I told her I was only out there for a time for my health. That I was rich back in the city, with a fine home and everything. She believed me. Little fool!" He chuckled as he said it, and my anger, mounting with his every devilish word, made the finger on the trigger in my pocket take a tighter crook

to itself. "I asked her to skip with me," the droning went on, "made her a lot of great promises, and she fell for it." His dry jaw bones clanked and chattered as if he enjoyed the beastly recital of his achievement, while we sat gaping at him, believing either that the man must be mad, or that we were the mad ones, or dreaming.

"We slipped away one night," continued the beast. "Went to the city. To a punk hotel. For three weeks we stayed there. Then one morning I told her I was going out for a shave. I was. I got the shave. But I hadn't thought it worth while to tell her I wouldn't be back. Well, she got back to the farm some way, though I don't know—"

"What!" I shouted, springing before him. "What! You mean you left her there! After you'd taken her, you left her! And here you sit crowing over it! Gloating! Boasting! Why you—!" I lived in a rough country. Associated with rough men, heard their vicious language, but seldom used a strong word myself. But as I stood over that monster, utterly hating the beastly thing, all the vile oaths and prickly language

of the countryside, no doubt buried in some unused cell in my brain, spilled from my tongue upon him. When I had lashed him as fiercely as I was able I cried: "Why don't you come at me? Didn't you hear what I called you? You beast! I'd like to riddle you!" I shouted, drawing my gun.

"Aw, sit down!" he jeered, waving his rattling hand at me. "You ain't heard a thing yet. Let me finish. Well, she got back to the farm some way or another, and something over a year later I wandered into this country again too. I never could explain just why I came back. It was not altogether to see the girl. Her father was a little bit of a man and I began to remember what a meek and weak sheep he was. I got it into my head that it'd be fun to go back to his farm and rub it in. So I came.

"Her father was trying out a new corn planter right at the back door when I rounded the house and walked towards him. Then I saw, at once, that I had made a mistake. When he put his eyes on me his face went white and hard. He came down from the seat of that machine like a flash, and took hurried steps in the

direction of a doublebarrelled gun leaning against the woodshed. They always were troubled with hawks and kept a gun handy. But there was an ax nearer to me than the gun was to him. I had to work fast but I made it all right. I grabbed that ax, jumped at him as he reached for the gun, and swung—once. His wife, and the girl too, saw it. Then I turned and ran."

The gaunt brute before us slowly crossed one groaning knee above the other. We were all sitting again now. The perspiration rolled down my face. I held my gun trained upon him, and, though I now believed he was totally mad, because of a certain ring of truth in that empty voice, I sat fascinated. I looked at Seth. His jaw was hanging loose, his eyes bulging. Hammersly's mouth was set in a tight clenched line, his eyes like fire in his blue, drawn face. I could not see the others.

"The telephone caught me," continued our ghastly story-teller, "and in no time at all I was convicted and the date set for the hanging. When my time was pretty close a doctor or scientist fellow came to see me who said, 'Blaggett, you're slated to die. How

much will you sell me your body for?' If he didn't say it that way he meant just that. And I said, 'Nothing. I've no one to leave money to. What do you want with my body?' And he told me, 'I believe I can bring you back to life and health, provided they don't snap your neck when they drop you.' 'Oh, you're one of *those* guys, are you?' I said then. 'All right, hop to it. If you can do it I'll be much obliged. Then I can go back on that farm and do a little more ax swinging!'" Again came his horrible chuckle, again I mopped my brow.

"So we made our plans," he went on, pleased with our discomfiture and our despising of him. "Next day some chap came to see me, pretending he was my brother. And I carried out my part of it by cursing him at first and then begging him to give me decent burial. So he went away, and, I suppose, received permission to get me right after I was cut down.

"There was a fence built around the scaffold they had ready for me and the party I was about to fling, and they had some militia there, too. The crowd seemed quiet enough till they led me out. Then their buzzing sounded like a hive of bees getting all stirred up.

Then a few loud voices, then shouts. Some rocks came flying at me after that, and it looked to me as though the hanging would not be so gentle a party after all. I tell you I was afraid. I wished it was over.

"The mob pushed against the fence and flattened it out, coming over it like waves over a beach. The soldiers fired into the air, but still they came, and I, I ran—up, onto the scaffold. It was safer!" As he said this he chuckled loudly. "I'll bet," he laughed, "that's the first time a guy ever ran into the noose for the safety of it! The mob came only to the foot of the scaffold though, from where they seemed satisfied to see the law take its course. The sheriff was nervous. So cut up that he only made a fling at tying my ankles, just dropped a rope around my wrists. He was like me, he wanted to get it over, and the crowd on its way. Then he put the rope around my neck, stepped back and shot the trap. Zamm! No time for a prayer—or for me to laugh at the offer!—or a last word or anything.

"I felt the floor give, felt myself shoot through. Smack! My weight on the end of the rope hit me

behind the ears like a mallet. Everything went black. Of course it would have been just my luck to get a broken neck out of it and give the scientist no chance to revive me. But after a second or two, or a minute, or it could have been an hour, the blackness went away enough to allow me to know I was hanging on the end of the rope, kicking, fighting, choking to death. My tongue swelled, my face and head and heart and body seemed ready to burst. Slowly I went into a deep mist that I knew then was *the* mist, then—then—I was off floating in the air over the heads of the crowd, watching my own hanging!

"I saw them give that slowly swinging carcass on the end of its rope time enough to thoroughly die, then, from my aerial, unseen watching place, I saw them cut it—me—down. They tried the pulse of the body that had been mine, they examined my staring eyes. Then I heard them pronounce me dead. The fools! I had known I was dead for a minute or two by that time, else how could my spirit have been gone from the shell and be out floating around over their heads?"

He paused here as he asked his question, his head turning on its dry and creaking neck to include us all in his query. But none of us spoke. We were dreaming it all, of course, or were mad, we thought.

"In just a short while," went on the skeleton, "my 'brother' came driving slowly in for my body. With no special hurry he loaded me onto his little truck and drove easily away. But once clear of the crowd he pushed his foot down on the gas and in five more minutes—with me hovering all the while alongside of him, mind you—floating along as though I had been a bird all my life—we turned into the driveway of a summer home. The scientific guy met him. They carried me into the house, into a fine-fitted laboratory. My dead body was placed on a table, a huge knife ripped my clothes from me.

"Quickly the loads from ten or a dozen hypodermic syringes were shot into different parts of my naked body. Then it was carried across the room to what looked like a large glass bottle, or vase, with an opening in the top. Through this door I was lowered, my body being held upright by straps in there for that

purpose. The door to the opening was then placed in position, and by means of an acetylene torch and some easily melting glass, the door was sealed tight.

[Image description start: A black and white illustration showing a dead man, clothed only with a small loincloth, suspended in the air by a harness inside a large glass container shaped like a lightbulb, while two scientists wearing lab coats and safety goggles look on. Image description end.]

"So there stood my poor old body. Ready for the experiment to bring it back to life. And as my new self floated around above the scientist and his helper I smiled to myself, for I was sure the experiment would prove a failure, even though I now knew that the sheriff's haste had kept him from placing the rope right at my throat and had saved me a broken neck. I was dead. All that was left of me now was my spirit, or soul. And that was swimming and floating about above their heads with not an inclination in the world to have a thing to do with the husk of the man I could clearly see through the glass of the bell.

"They turned on a huge battery of ultra-violet rays then," continued the hollow droning of the man who had been hanged, "which, as the scientist had explained to me while in prison, acting upon the

contents of the syringes, by that time scattered through my whole body, was to renew the spark of life within the dead thing hanging there. Through a tube, and by means of a valve entering the glass vase in the top, the scientist then admitted a dense white gas. So thick was it that in a moment or two my body's transparent coffin appeared to be full of a liquid as white as milk. Electricity then revolved my cage around so that my body was insured a complete and even exposure to the rays of the green and violet lamps. And while all this silly stuff was going on, around and around the laboratory I floated, confident of the complete failure of the whole thing, yet determined to see it through if for no other reason than to see the discomfiture and disappointment that this mere man was bound to experience. You see, I was already looking back upon earthly mortals as being inferior, and now as I waited for this proof I was all the while fighting off a new urge to be going elsewhere. Something was calling me, beckoning me to be coming into the full spirit world. But I wanted to see this wise earth guy fail.

"For a little while conditions stayed the same within that glass. So thick was the liquid gas in there at first that I could see nothing. Then it began to clear, and I saw to my surprise that the milky gas was disappearing because it was being forced in by the rays from the lights in through the pores into the body itself. As though my form was sucking it in like a sponge. The scientist and his helper were tense and taut with excitement. And suddenly my comfortable feeling left me. Until then it had seemed so smooth and velvety and peaceful drifting around over their heads, as though lying on a soft, fleecy cloud. But now I felt a sudden squeezing of my spirit body. Then I was in an agony. Before I knew what I was doing my spirit was clinging to the outside of that twisting glass bell, clawing to get into the body that was coming back to life! The glass now was perfectly clear of the gas, though as yet there was no sign of life in the body inside to hint to the scientist that he was to be successful. But I knew it. For I fought desperately to break in through the glass to get back into my discarded shell of a body again, knowing I must get in or die a worse death than I had before.

"Then my sharper eyes noted a slight shiver passing over the white thing before me, and the scientist must have seen it in the next second, for he sprang forward with a choking cry of delight. Then the lolling head inside lifted a bit. I—still desperately clinging with my spirit hands to the outside, and all the time growing weaker and weaker—I saw the breast of my body rise and fall. The assistant picked up a heavy steel hammer and stood ready to crash open the glass at the right moment. Then my once dead eyes opened in there to look around, while I, clinging and gasping outside, just as I had on the scaffold, went into a deeper, darker blackness than ever. Just before my spirit life died utterly I saw the eyes of my body realize completely what was going on, then—from the inside now—I saw the scientist give the signal that caused the assistant to crash away the glass shell with one blow of his hammer.

"They reached in for me then, and I fainted. When I came back to consciousness I was being carefully, slowly revived, and nursed back to life by oxygen and a pulmotor."

The terrible creature telling us this tale paused again to look around. My knees were weak, my clothes wet with sweat.

"Is that all?" I asked in a piping, strange voice, half sarcastic, half unbelieving, and wholly spellbound.

"Just about," he answered. "But what do you expect? I left my friend the scientist at once, even though he did hate to see me go. It had been all right while he was so keen on the experiment himself and while he only half believed his ability to bring me back. But now that he'd done it, it kinda worried him to think what sort of a man he was turning loose of the world again. I could see how he was figuring, and because I had no idea of letting him try another experiment on me, p'r'aps of putting me away again, I beat it in a hurry.

"That was five years ago. For five years I've lived with only just part of me here. Whatever it was trying to get back into that glass just before my body came to life—my spirit, I've been calling it—I've been without. It never did get back. You see, the scientist brought

me back inside a shell that kept my spirit out. That's why I'm the skeleton you see I am. Something vital is missing."

He stood up cracking and creaking before us, buttoning his loose coat about his angular body. "Well, boys," he asked lightly, "what do you think of that?"

"I think you're a liar! A damn liar!" I cried. "And now, if you don't want me to fill you full of lead, get out of here and get out now! If I have to do it to you, there's no scientist this time to bring you back. When you go out you'll stay out!"

"Don't worry," he grimaced back to me, waving a mass of bones that should have been a hand contemptuously at me, "I'm going. I'm headed for Shelton." He stalked the length of the floor and shut the door behind him. The beast had gone.

"The dirty liar!" I cried. "I wish—yes—I wish I had an excuse to kill him. Just think of that being loose, will you? A brute who would think up such a yarn! Of course it's all absurd. All crazy. All a lie."

"No. It's not a lie."

I turned to see who had spoken. Hammersly's voice was so unfamiliar and now so torn in addition that I could not have thought he had spoken, had he not been looking right at me, his glittering eyes challenging my assertion. Would wonders never cease? I asked myself. First this outrageous yarn, now Hammersly, the "sphinx," expressing an opinion, looking for an argument! Of course it must be that his susceptible and brooding brain had been turned a bit by the evening we had just experienced.

"Why Hammersly! You don't believe it?" I asked.

"I not only believe it, Jerry, but now it's my turn to say, as he did, I *know* it! Jerry, old friend," he went on, "that devil told the truth. He was hanged. He was brought back to life; and Jerry—I was that scientist!"

Whew! I fell back to a box again. My knees seemed to forsake me. Then I heard Hammersly talking to himself.

"Five years it's been," he muttered. "Five years since I turned him loose again. Five years of agony for me, wondering what new devilish crimes he was perpetrating, wondering when he would return to that little farm to swing his ax again. Five years—five years."

He came over to me, and without a word of explanation or to ask my permission he reached his hand into my pocket and drew out my revolver, and I did not protest.

"He said he was headed for Shelton," went on Hammersly's spoken thoughts. "If I slip across the ice I can intercept him at Black's woods." Buttoning his coat closely, he followed the stranger out into the night.

I was glad the moon had come up for my walk home, glad too when I had the door locked and propped with a chair behind me. I undressed in the dark, not wanting any grisly, sunken-eyed monster to be looking in through the window at me. For maybe, so I thought, maybe he was after all not headed for

Shelton, but perhaps planning on another of his ghastly tricks.

But in the morning we knew he had been going toward Shelton. Scientists, doctors, and learned men of all descriptions came out to our village to see the thing the papers said Si Waters had stumbled upon when on his way to the creamery that next morning.

It was a skeleton, they said, only that it had a dry skin all over it. A mummy. Could not have been considered capable of containing life only that the snow around it was lightly blotched with a pale smear that proved to be blood, that had oozed out from the six bullet holes in the horrid chest. They never did solve it.

There were five of us in the store that night. Five of us who know. Hammersly did what we all wanted to do. Of course his name is not really Hammersly, but it has done here as well as another. He is black-whiskered though, and he is still very much of a sphinx, but he'll never have to answer for having killed the man he once brought back to life. Hammersly's secret will go into five other graves

besides his own.

#21 Monsters Of Moyen, By Arthur Josephus Burks:

"The western world shall be next!" was the dread ultimatum of the half-monster, half-god Moyen.

Aproximate word count: 17,000

Bigotry:

Warnings:

- - -

Forward:

In 1935 the mighty genius of Moyen gripped the Eastern world like a hand of steel. In a matter of months he had welded the Orient into an unbeatable war-machine. He had, through the sheer magnetism of a strange personality, carried the Eastern world with him on his march to conquest of the earth, and men followed him with blind faith as men in the past have followed the banners of the Thaumaturgists.

A strange name, to the sound of which none could assign nationality. Some said his father was a Russian refugee, his mother a Mongol woman. Some said he was the son of a Caucasian woman lost in the Gobi and rescued by a mad lama of Tibet, who became father of Moyen. Some said that his mother was a goddess, his father a fiend out of hell.

But this all men knew about him: that he combined within himself the courage of a Hannibal, the military genius of a Napoleon, the ideals of a Sun Yat Sen; and that he had sworn to himself he would never rest until the earth was peopled by a single nation, with Moyen himself in the seat of the mighty ruler.

Madagascar was the seat of his government, from which he looked across into United Africa, the first to join his confederacy. The Orient was a dependency, even to that forbidden land of the Goloks, where outlanders sometimes went, but whence they never returned—and to the wild Goloks he was a god whose will was absolute, to render obedience to whom was a privilege accorded only to the Chosen.

In a short year his confederacy had brought under his might the millions of Asia, which he had welded into a mighty machine for further conquest.

And because the Americas saw the handwriting on the wall, they sent out to see the man Moyen, with orders to penetrate to his very side, as a spy, their most trusted Secret Agent—Prester Kleig.

Only the ignorant believed that Moyen was mad. The military and diplomatic geniuses of the world recognized his genius, and resented it.

But Prester Kleig, of the Secret Service of the Americas, one of the *few* men whose headquarters were in the Secret Room in Washington, had reached Moyen.

Now he was coming home.

He came home to tell his people what Moyen was planning, and to admit that his investigations had been hampered at every turn by the uncanny genius of Moyen. Military plans had been guarded with

unbelievable secrecy. War machines he knew to exist, yet had seen only those common to all the armies of the world.

And now, twenty-four hours out of New York City, aboard the *S. S. Stellar*, Prester Kleig was literally willing the steamer to greater speed—and in far Madagascar the strange man called Moyen had given the ultimatum:

"The Western World shall be next!"

Chapter 1: The Hand of Moyen.

"Who is that man?" asked a young lady passenger of the steward, with the imperious inflection which tells of riches able to force obedience from menials who labor for hire.

She pointed a bejeweled finger at the slender, soldierly figure which stood in the prow of the liner, like a figurehead, peering into the storm under the vessel's forefoot.

"That gentleman, milady?" repeated the steward obsequiously. "That is Prester Kleig, head of the Secret Agents, Master of the Secret Room, just now returning from Madagascar, via Europe, after a visit to the realm of Moyen."

A gasp of terror burst from the lips of the woman. Her cheeks blanched.

"Moyen!" She almost whispered it. "Moyen! The half-god of Asia, whom men call mad!"

"Not mad, milady. No, Moyen is not mad, save with a lust for power. He is the conqueror of the ages, already ruling more of the earth's population than any man has ever done before him—even Alexander!"

But the young lady was not listening to stewards. Wealthy young ladies did not, save when asked questions dealing with personal service to themselves. Her eyes devoured the slender man who stood in the prow of the *Stellar*, while her lips shaped, over and over again, the dread name which was on the lips of the people of the world:

"Moyen! Moyen!"

Up in the prow, if Prester Kleig, who carried a dread secret in his breast, knew of the young lady's regard, he gave no sign. There were touches of gray at his temples, though he was still under forty. He had seen more of life, knew more of its terrors, than most men twice his age—because he had lived harshly in service to his country.

He was thinking of Moyen, the genius of the misshapen body, the pale eyes which reflected the fires of a Satanic soul, set deeply in the midst of the face of an angel; and wondering if he would be able to arrive in time, sorry that he had not returned home by airplane.

He had taken the *Stellar* only because the peacefulness of ocean liner travel would aid his thoughts, and he required time to marshal them. Liner travel was now a luxury, as all save the immensely wealthy traveled by plane across the oceans. Now Prester Kleig was sorry, for any moment, he felt, Moyen might strike.

He turned and looked back along the deck of the *Stellar*. His eyes played over the trimly gowned figure of the woman who questioned the steward, but did not really see her. And then....

"Great God!" The words were a prayer, and they burst from the lips of Prester Kleig like an explosion. Passengers appeared from the lee of lifeboats. Officers on the bridge whirled to look at the man who shouted. Seamen paused in their labors to stare. Aloft in the crow's-nest the lookout lowered his eyes from scouring the horizon to stare at Prester Kleig—who was pointing.

All eyes turned in the direction indicated.

Climbing into the sky, a mile off the starboard beam, was an airplane with a bulbous body and queerly slanted wings. It had neither wheels nor pontoons, and it traveled with unbelievable speed. It came on bullet-fast, headed directly for the side of the *Stellar*.

"Lower the boats!" yelled Kleig. "Lower the boats! For God's sake lower the boats!"

For Prester Kleig, in that casual turning, had seen what none aboard the *Stellar*, even the lookout above, had seen. The airplane, which had neither wheels nor pontoons, had risen, as Aphrodite is said to have risen, out of the waves! He had seen the wings come out of the bulbous body, snap backward into place, and the plane was in full flight the instant it appeared.

Prester Kleig had no hope that his warning would be in time, but he would always feel better for having given it. As the captain debated with himself as to whether this lunatic should be confined as dangerous, the strange airplane nosed over and dived down to the sea, a hundred yards from the side of the *Stellar*. Just before it struck the water, its wings snapped forward and became part of the bulbous body of the thing, the whole of which shot like a bullet into the sea.

Prester Kleig stood at the rail, peering out at the spot where the plane had plunged in with scarcely a splash, and his right hand was raised as though he gave a final, despairing signal.

Of all aboard the *Stellar*, he only saw that black streak which, ten feet under water, raced like a bolt of lightning from the nose of the submerged but visible plane, straight as a die for the side of the *Stellar*. Just a black streak, no bigger than a small man's arm, from the nose of the plane to the side of the *Stellar*.

From the crow's-nest came the startled, terrific voice of the lookout, in the beginning of a cry that must remain forever inarticulate.

The world, in that blinding moment, seemed to rock on its foundations; to shatter itself to bits in a chaotic jumble of sound and of movement, shot through and through with lurid flames. Kleig felt himself hurled upward and outward, turned over and over endlessly....

He felt the storm-tossed waters close over him, and knew he had struck. In the moment he knew—oblivion, deep, ebon and impenetrable, blotted out knowledge.

Chapter 2: The Half-Dream

A roaring, rushing river of chaotic sound, first. Jumbled sound to which Prester Kleig could give no adequate name. But as he tried to analyze its meanings, he was able to differentiate between sounds, and to discover the identity of some.

The river of sound he decided to be the sound of a vibrational explosion of some sort—vibrational because it had that quivery quality which causes a feeling of uneasiness and fret, that feeling which makes one turn and look around to find the eyes boring into one's back—yet multiplied in its intensity an uncounted number of times.

Other sounds which came through the chaotic river of sound were the terrified screaming of the men and women who were doomed. Lifeboats were never lowered, for the reason that with the disintegration of the *Stellar*, everything inanimate aboard her likewise disintegrated, dropping men and women, crew and passengers, into the freezing waters of the Atlantic.

Prester Kleig dropped with them, only partially unconscious after the first icy plunge. He knew when he floated on the surface, for he felt himself lifted and hurled by the waves. In his half-dream he saw men and women being carried away into wave-shrouded darkness, clawing wildly at nothingness for support, clawing at one another, locking arms, and going down together.

The *Stellar*, in the merest matter of seconds, had become spoil of the sea, and her crew and passengers had vanished forever from the sight of men. Yet Prester Kleig lived on, knew that he lived on, and that there was an element, too strong to be disbelieved, of reality in his dream.

There was a vibratory sense, too, as of the near activity of a noiseless motor. Noiseless motor! Where had he last thought of those two words? With what recent catastrophe were they associated? No, he could not recall, though he knew he should be able to do so.

Then the sense of motion to the front was apparent—

an unnumbered sense, rather than concrete feeling. Motion to front, influenced by the rising and falling motion of mountainous waves.

So suddenly as to be a distinct shock, the wave motion ceased, though the forward motion—and *upward!*—not only continued but increased.

That airplane of the bulbous body, the queerly slanted wings....

But the glimmering of realization vanished as a sickishly sweet odor assailed his nostrils and sent its swift-moving tentacles upward to wrap themselves soothingly about his brain. But the sense of flight, unbelievably swift, was present and recognizable, though all else eluded him. He had the impression, however, that it was intended that all save the most vagrant, most widely differentiated, impressions elude him—that he should acquire only half pictures, which would therefore be all the more terrible in retrospect.

The only impressions which were real were those of

motion to the front, and upward, and the sense of noiseless machinery, vibrating the whole, nearby.

Then a distinct realization of the cessation of the sense of flying, and a return, though in lesser degree, of the rising and falling of waves. This latter sensation became less and less, though the feeling of traveling downward continued. Prester Kleig knew that he was going down into the sea again, down into it deeply.... Then that odor once more, and the elusive memory.

Forward motion at last, in the depths, swift, forward motion, though Prester Kleig could not even guess at the direction. Just swift motion, and the mutter of voices, the giving of orders....

Prester Kleig regained consciousness fully on the sands of the shore. He sat up stiffly, staring out to sea. A storm was raging, and the sea was an angry waste. No ship showed on the waters; the mad, tumbled sky above it was either empty of planes or they had climbed to invisibility above the clouds that raced and churned with the storm.

Out of the storm, almost at Prester Kleig's feet, dropped a small airplane. Through the window a familiar face peered at Kleig. A helmeted, begoggled figure opened the door and stepped out.

"Kleig, old man," said the flyer, "you gave me the right dope all right, but I'll swear there isn't a wireless tower within a hundred miles of this place! How did you manage it?"

"Kane, you're crazy, or I am, or...." But Prester Kleig could not go on with the thought which had rushed through his brain with the numbing impact of a blow. He grasped the hand of Carlos Kane, of the Domestic Service, and the yellow flimsy Kane held out to him. It read simply:

"Shipwrecked. Am ashore at—" There followed grid coordinate map readings. "Come at once, prepared to fly me to Washington." It was signed "Kleig."

"Kane," said Kleig, "I did not send this message!"

What more was there to be said? Horror looked out of

the eyes of Prester Kleig, and was reflected in those of Carlos Kane. Both men turned, peering out across the tumbled welter of waters.

Somewhere out there, tight-locked in the gloomy archives of the Atlantic, was the secret of the message which had brought Carlos Kane to Prester Kleig—and the agency which had sent it.

Chapter 3: Wings of To-morrow

As Prester Kleig climbed into the enclosed passenger pit of the monoplane—a Mayther—his ears seemed literally to be ringing with the drumming, mighty voice of Moyen. But now that voice, instead of merely speaking, rang with sardonic laughter. He had never heard the laughter of Moyen, but he could guess how it would sound.

That airplane of the slanted wings, the bulbous, almost bulletlike fuselage, what of it? It was simple, as Kleig looked back at his memoried glimpse of it. The submarine was a metal fish made with human hands; the airplane aped the birds. The strange ship which had caused the destruction of the *Stellar*, was a combination fish and bird—which merely aped nature a bit further, as anyone who had ever traversed tropical waters would have instantly recognized.

But what did it portend? What ghastly terrors of Moyen roamed the deeps of the Atlantic, of the Pacific, the oceans of the world? How close were some of these to the United States?

The pale eyes of Moyon, he was sure, were already turned toward the West.

Prester Kleig sighed as he seated himself beside Carlos Kane. Then Kane pressed one of the myriad of buttons on the dash, and Kleig lifted his eyes to peer through the skylight, to where that single press of a button had set in motion the intricate machinery of the helicopter.

A four-bladed fan lifted on a slender pedestal, sufficiently high above the surface of the wing for the vanes to be free of the central propeller. Then, automatically, the vanes became invisible, and the Mayther lifted from the sandy beach as lightly, and far more straightly, than any bird.

As the ship climbed away for the skies, and through the transparent floor the beach and the Atlantic fell away below the ship, a sigh of relief escaped Kleig. This was living! Up here one was free, if only for a moment, and the swift wind of flight brushed all cobwebs from the tired human brain. He watched the slender needle of the altimeter, as it moved around

the face of the dial as steadily as the hands of a clock, around to thirty thousand, thirty-five, forty.

Then Carlos Kane, every movement as effortless as the flight of the silvery winged Mayther, thrust forth his hand to the dash again, pressed another button. Instantly the propellers vanished into a blur as the vanes of the helicopter dropped down the slender staff and the vanes themselves fitted snugly into their appointed notches atop the wing.

For a second Carlos Kane glanced at the tiny map to the right of the dash, and set his course. It was a matter of moments only, but while Kane worked, Prester Kleig studied the instruments on the dash, for it had been months since he had flown, save for his recent half-dreamlike experience. There was a button which released the mechanism of the deadly guns, fired by compressed air, all operated from the noiseless motor, whose muzzles exactly cleared the tips of Mayther's wings, two guns to each wing, one on the entering edge, one on the trailing edge, fitted snugly into the adamant rigging.

Four guns which could fire to right or left, twin streams of lead, the number of rounds governed only by the carrying power of the Mayther. Prester Kleig knew them all: the guns in the wings, the guns which fired through the three propellers, and the guns set two and two in the fuselage, to right and left of the pits, which could be fixed either up or down—all by the mere pressing of buttons. It was marvelous, miraculous, yet even as Kleig told himself that this was so, he felt, deep in the heart of him, that Moyen knew all about ships like these, and regarded them as the toys of children.

Kane touched Kleig on the shoulder, signaling, indicating that the atmosphere in the pits had been regulated to their new height, and that they could remove their helmets and oxygen tanks without danger.

With a sigh Prester Kleig sat back, and the two friends turned to face each other.

"You certainly look done in, Kleig," said Kane sympathetically. "You must have been through hell,

and then some. Tell me about this Moyen; that is, if you think you care to talk about him."

"Talk about him!" repeated Kleig. "Talk about him? It will be a relief! There has been nothing, and nobody, on my mind save Moyen for weary months on end. If I don't talk to someone about him, I'll go mad, if I'm not mad already. Moyen? A monster with the face of an angel! What else can one say about him? A devil and a saint, a brute whose followers would go with him into hell's fire, and sing him hosannas as they were consumed in agony! The greatest mob psychologist the world has ever seen. He's a genius, Kane, and unless something is done, the Western world, all the world, is doomed to sit at the feet, listen to the commands, of Moyen!

"He isn't an Oriental; he isn't a European; he isn't negroid or Indian; but there is something about him that makes one thing of all of these, singly and collectively. His body is twisted and grotesque, and when one looks at his face, one feels a desire to touch him, to swear eternal fealty to him—until one looks into his pale eyes, eyes almost milky in their paleness

—and gets the merest hint of the thoughts which actuate him. If he has a failing I did not find it. He does not drink, gamble...."

"And women?" queried Kane, softly.

Kleig was madly in love with the sister of Kane, Charmion, and this thing touched him nearest the heart, because Charmion was one of her country's most famous beauties, about whom Moyen must already have heard.

"Women?" repeated Kleig musingly, his black eyes troubled, haunted. "I scarcely know. He has no love for women, only because he has no capacity for any love save self-love. But when I think of him in this connection I seem to see Moyen, grown to monster proportions, sitting on a mighty throne, with nude women groveling at his feet, bathed in tears, their long hair in mantles of sorrow, hiding their shamed faces! That sounds wild, doesn't it? But it's the picture I get of Moyen when I think of Moyen and of women. Many women will love him, and have, perhaps. But while he has taken many, though I am

only guessing here, he has given *himself* to none. Another thing: His followers—well, he sets no limits to the lusts of his men, requiring only that every soldier be fit for duty, with a body strong for hardship. You understand?"

Kane understood; and his face was very pale.

"Yes," he said, his voice almost a whisper, "I understand, and as you speak of this man I seem to see a city in ruins, and hordes of men marching, bloodstained men entering houses ... from which, immediately afterward, come the screams of women ... terror-stricken women...."

He shuddered and could not go on for the very horror of the vision that had come to him.

But Kleig stared at him as though he saw a ghost.

"Great God, Carl!" he gasped. "The same identical picture has been in my mind, not once but a thousand times! I wonder...."

Was it an omen of the future for the West?

Deep in his soul Prester Kleig fancied he could hear the sardonic laughter of the half-god, Moyen.

A tiny bell rang inside the dash, behind the instruments. Kane had set direction finders, had pressed the button which signaled the Washington-control Station of the National Radio, thus automatically indicating the exact spot above land, by grid-coordinates, where the Mayther should start down for the landing.

An hour later they landed on the flat roof of the new Capitol Building, sinking lightly to rest as a feather, nursed to a gentle landing by the whirring vanes of the helicopter.

Prester Kleig, surrounded by uniformed guards who tried to shield him from the gaze of news-gatherers crowded there on the roof-top, hurried him to the stairway leading into the executive chambers, and through these to the Secret Chamber which only a few men knew, and into which not even Carlos Kane

could follow Prester Kleig—yet.

But one man, one news-gatherer, had caught a glimpse of the face of Kleig, and already he raced for the radio tower of his organization, to blazon to the Western world the fact that Kleig had come back.

Chapter 4: A Nation Waits in Dread

As Prester Kleig, looking twice his forty years because of fatigue, and almost nameless terrors through which he had passed, went to his rendezvous, the news-gatherer, who shall here remain nameless, raced for the Broadcasting Tower.

As Prester Kleig entered the Secret Room and at a signal all the many doors behind him, along that interminable stairway, swung shut and were tightly locked, the news-gatherer raced for the microphone and gave the "priority" signal to the operator. Millions of people would not only hear the words of the news-gatherer, but would see him, note the expressions which chased one another across his face. For television was long since an accomplished, everyday fact.

"Prester Kleig, of this government's Secret Service, has just returned to the United Americas! Your informer has just seen him step from the monoplane of Carlos Kane, atop the Capitol Building, and repair at once to the Secret Room, closely guarded. But I

saw his face, and though he is under forty, he seems twice that. And you know now what this country has only guessed at before—that he has seen Moyen. Moyen the half-man, half-god, the enigma of the ages. What does Prester Kleig think of this man? He doesn't say, for he dares not speak, yet. But your informer saw his face, and it is old and twisted with terror! And —"

That ended the discourse of the news-gatherer, and it was many hours before the public really understood. For, with a new sentence but half completed, the picture of the news-gatherer faded blackly off the screens in a million homes, and his voice was blotted out by a humming that mounted to a terrific appalling shriek! Some terrible agency, about which people who knew their radio could only guess, had drowned out the words of the news-gatherer, leaving the public stunned and bewildered, almost groping before a feeling of terror which was all the more unbearable because none could give it a name.

And the public had heard but a fraction of the truth—merely that Kleig had come back. It had been the

intention of the government to deny the public even this knowledge, and it had; but knowledge of the denial itself was public property, which filled the hearts of men and women all through the Western Hemisphere with nameless dread. And over all this abode of countless millions hovered the shadow of Moyen.

The government tried to correct the impression which the news-gatherer had given out.

"Prester Kleig is back," said the radio, while the government speaker tried, for the benefit of those who could see him, to smile reassuringly. "But there is nothing to cause anyone the slightest concern. He has seen Moyen, yes, and has heard him speak, but still there is nothing to distress anyone, and the whole story will be given to you as soon as possible. Kleig has gone into the Secret Room, yes, but every operative of the government, when discussing business connected with diplomatic relations with foreign powers, is received in the Secret Room. No cause for worry!"

It was so easy to say that, and the speaker realized it, which was why he could but with difficulty make his smile seem reassuring.

"Tell us the truth, and tell us quickly," might have been the voiceless cries of those who listened and saw the face and fidgeting form of the speaker. But the words were not spoken, because the people sensed a hovering horror, a dread catastrophe beyond the power of words to express—and so looked at one another in silence, their eyes wide with dread, their hearts throbbing to suffocation with nameless foreboding.

So eyes were horror-haunted, and men walked, flew, and rode in fear and trembling—while, down in the Secret Room, Prester Kleig and a dozen old men, men wise in the ways of science and invention, wise in the ways of men and of beasts, of Nature and the Infinite Outside, decided the fate of the Nation.

That Secret Room was closed to every one. Not even the news-gatherers could reach it; not even the all-seeing eye of the telephotograph emblazoned to the

world its secrets.

But *was* it secret?

Perhaps Moyen, the master mobster, smiled when he heard men say so, men who knew in their hearts that Moyen regarded other earthlings as earthlings regard children and their toys. Did the eyes of Moyen gaze even into the depths of the Secret Room, hundreds of feet below even the documentary-treasure vaults of the Capitol?

No one knew the answer to the question, but the radio, reporting the return of Kleig, had given the public a distorted vision of an embodied fear, and in its heart the public answered "Yes!" And what had drowned out the voice of the radio-reporter?

No wonder that, for many hours, a nation waited in fear and trembling, eyes filled with dread that was nameless and absolute, for word from the Secret Room. Fear mounted and mounted as the hours passed and no word came.

In that room Prester Kleig and the twelve old men, one of whom was the country's President, held counsel with the man who had come back. But before the spoken counsel had been held, awesome and awe-inspiring pictures had flashed across the screen, invented by a third of the old men, from which the world held no secrets, even the secrets of Moyon.

With this mechanism, guarded at forfeit of the lives of a score of men, the men of the Secret Room could peer into even the most secret places of the world. The old men had peered, and had seen things which had blanched their pale cheeks anew. And when they had finished, and the terrible pictures had faded out, a voice had spoken suddenly, like an explosion, in the Secret Room.

"Well, gentlemen, are you satisfied that resistance is futile?"

Just the voice; but to one man in the Secret Room, and to the others when his numbing lips spoke the name, it was far more than enough. For not even the wisest of the great men could explain how, as they

knew, having just seen him there, a man could be in Madagascar while his voice spoke aloud in the Secret Room, where even radio was barred!

The name on the lips of Prester Kleig!

"Moyen! Moyen!"

Chapter 5: *Monsters of the Deep*

"Gentlemen," said Prester Kleig as he entered the Secret Room, where sat the scientists and inventive geniuses of the Americas, "we haven't much time, and I shall waste but little of it. Moyen is ready to strike, if he hasn't already done so, as I believe. We will see in a matter of seconds. Professor Maniel, we shall need, first of all, your apparatus for returning the vibratory images of events which have transpired within the last thirty-six hours.

"I wish to show those of you who failed to see it the sinking of the *Stellar*, on which I was a passenger and, I believe, the only survivor."

Professor Maniel strangely mouse-like save for the ponderous dome of his forehead, stepped away from the circular table without a word. He had invented the machine in question, and he was inordinately proud of it. Through its use he could pick up the

sounds, and the pictures, of events which had transpired down the past centuries, from the tinkling of the cymbals of Miriam to all the horror of the conflict men had called the Great War, simply by drawing back from the ether, as the sounds fled outward through space, those sounds and vibrations which he needed.

His science was an exact one, more carefully exact even than the measurement of the speed of light, taking into consideration the dispersion of sound and movement, and the element of time.

The interior of the Secret Room became dark as Maniel labored with his minute machinery. Only behind the screen on the wall in rear of the table was there light.

The voice of Maniel began to drone as he thought aloud.

"There is a matter of but a few minutes difference in time between Washington and the last recorded location of the *Stellar*. The sinking occurred at ten-

thirty last evening you say, Kleig? Ah, yes, I have it! Watch carefully, gentlemen!"

So silent were the Secret Agents one could not even have heard the breathing of one of them, for on the screen, misty at first, but becoming moment by moment bolder of outline, was the face of a storm-tossed sea. The liner was slower in forming, and was slightly out of focus for a second or two.

"Ah," said Professor Maniel. "There it is!"

Through the sound apparatus came the roaring and moaning of a storm at sea. On the screen the *Stellar* rose high on the waves, dropped into the trough, while spumes of black smoke spread rearward on the waters from her spouting funnels. Figures were visible on her decks, figures which seemed carved in bronze.

In the prow, every expression on his face plainly visible, stood Prester Kleig himself, and as his picture appeared he was in the act of turning.

"Now," said Kleig himself, there in the Secret Room, "look off to the left, gentlemen, a mile from the *Stellar*!"

A rustling sound as the scientists shifted in their places.

They all saw it, and a gasp burst from their lips as though at a signal. For, as the *Stellar* seemed about to plunge off the shadowed screen into the Secret Room, a flying thing had risen out of the sea—an airplane with a bulbous body and queerly slanting wings.

At the same time, out of the mouth of the pictured figure of Prester Kleig, clear and agonized as the tones of a bell struck in frenzy, the words:

"Great God! Lower the boats! Lower the boats! For God's sake lower the boats!"

In the Secret Room the real Prester Kleig spoke again.

"When the black streak leaves the nose of the plane,

after it has submerged, Professor Maniel," said Kleig softly, "slow your mechanism so that we can see the whole thing in detail."

There came a grunted affirmative from Professor Maniel.

The nose of the pictured plane tilted over, diving down for the surface of the sea.

"Now!" snapped Kleig. "Don't wait!"

Instantly the moving pictures on the screen reduced their speed, and the plane appeared to stop its sudden seaward plunge and to drop down as lightly as a feather. The wings of the thing moved forward slowly, folding into the body of the dropping plane.

"They fold forward," said Kleig quietly, "so that the speed of the plane in the take-off will snap them *backward* into position for flying!"

No one spoke, because the explanation was so obvious.

Slowly the airplane went down to the surface of the sea, with scarcely a plume of spindrift leaping back after she had struck. She dropped to ten feet below the surface of the water, a hundred yards off the starboard beam of the *Stellar*, her blunt nose pointing squarely at the side of the doomed liner.

"Now," said Kleig hoarsely, "watch closely, for God's sake!"

[Image description start. A black and white illustration showing several white men gathered at a table in a dark room, watching a picture on the wall. Many of them wear glasses, and all are in suits, with faces wrinkled with age. Image description end.]

The liner rose and fell slowly. Out of the nose of the plane, which had now become a tiny submarine, started a narrow tube of black, oddly like the sepia of a giant squid. Straight toward the side of the liner it went. Above the rail the Secret Agents could see the pictured form of Prester Kleig, hand upraised. The black streak reached the side of the *Stellar*.

It touched the metal plates, spreading upon impact, growing, enlarging, to right and left, upward and downward, and where it touched the *Stellar* the black of it seemed to erase that portion of the ship. In the slow motion every detail was apparent. At regular speed the blotting out of the *Stellar* would have been instantaneous.

Kleig saw himself rise slowly from the vanished rail, turning over and over, going down to the sea. He almost closed his eyes, bit his lips to keep back the cries of terror when he saw the others aboard the liner rise, turn over and over, and fly in all directions like jackstraws in a high wind.

The ship was erased from beneath passengers and

crew, and passengers and crew fell into the sea. Out of the depths, from all directions, came the starving denizens of the sea—starving because liners now were so few.

"That's enough of that, Professor," snapped Kleig.

"Now jump ahead approximately eight hours, and see if you can pick up that aero-sub after it dropped me on the Jersey Coast."

The picture faded out quickly, the screaming of doomed human beings, already hours dead, called back to apparent living by the genius of Maniel died away, and for a space the screen was blank.

Then, the sea again, storm-tossed as before, shifting here and there as Maniel sought in the immensity of sea and sky for the thing he desired.

"Two hundred miles south by east of New York City," he droned. "There it is, gentlemen!"

They all saw it then, in full flight, eight thousand feet above the surface of the Atlantic, traveling south by

east at a dizzy rate of speed.

"Note," said Kleig, "that it keeps safely to the low altitudes, in order to escape the notice of regular air traffic."

No one answered.

The eyes of the Secret Agents were on that flashing, bulbous-bodied plane of the strange wings. It appeared to be heading directly for some objective which must be reached at top speed.

For fifteen minutes the flight continued. Then the plane tilted over and dived, and at an altitude still of three thousand feet, the wings slashed forward, clicking into their notches in the sides of the bulbous body, with a sound like the ratchets on subway turnstiles, and, holding their breath, the Secret Agents watched it plummet down to the sea. It was traveling with terrific speed when it struck, yet it entered the water with scarcely a splash.

Then, for the first time, an audible gasp, as that of

one person, came from the lips of the Secret Agents. For now they could see the objective of the aero-sub. A monster shadow in the water, at a depth of five hundred feet. A shadow which, as Maniel manipulated his instruments, became a floating underwater fortress, ten times the size of any submarine known to the Americas.

Sporting like porpoises about this held-in-suspension fortress were myriads of other aero-subs, maneuvering by squadrons and flights, weaving in and out like schools of fish. The plane which had borne Prester Kleig churned in between two of the formations, and vanished into the side of the motionless monster of the deep.

The striking of a deep sea bell, muted by tons and tons of water, sounded in the Secret Room.

"Don't turn it off, Maniel," said Kleig. "There's more yet!"

And there was, for the sound of the bell was a signal. The aero-subs, darting outward from the side of the

floating fortress like fish darting out of seaweed, were plunging up toward the surface of the Atlantic. Breathlessly the Secret Agents watched them.

They broke water like flying fish, and their wings shot backward from their notches in the myriad bulbous bodies to click into place in flying position as the scores of aero-subbs took the air above the invisible hiding places of the mother submarine.

At eight thousand feet the aero-subbs swung into battle formation and, as though controlled by word of command, they maneuvered there like one vast machine of a central control—beautiful as the flight of swallows, deadly as anything that flew.

The Secret Agents swept the cold sweat from their brows, and sighs of terror escaped them all.

At that moment came the voice, loud in the Secret Room, which Kleig at least immediately recognized:

"Well, gentlemen, are you satisfied that resistance is futile?"

And Kleig whispered the name, over and over again.

"Moyen! Moyen!"

It was Prester Kleig, Master of the Secret Room, who was the first to regain control after the nerve-numbing question which, asked in far Madagascar, was heard by the Agents in the Secret Room.

"No!" he shouted. "No! No! Moyen, in the end we will beat you!"

Only silence answered, but deep in the heart of Prester Kleig sounded a burst of sardonic laughter—the laughter of Moyen, half-god of Asia. Then the voice again:

"The attack is beginning, gentlemen! Within an hour you will have further evidence of the might of Moyen!"

Chapter 6: *Vanishing Ships*

Prester Kleig, ordered to Madagascar from the Secret Room, had been merely an operative, honored above others in that he had been one of the few, at that time, ever to visit the Secret Room. Now, however, because he had walked closer to Moyon than anyone else, he assumed leadership almost by natural right, and the men who had once deferred to him took orders from him.

"Gentlemen," he snapped, while the last words of Moyon still hung in the air of the Secret Room, "we must fight Moyon from here. The best brains in the United Americas are gathered here, and if Moyon can be beaten—*if* he can be beaten—he will be beaten from the Secret Room!"

A sigh from the lips of Professor Maniel. The President of the United Americas nodded his head, as though he too mutely gave authority into the hands of Prester Kleig. The other Secret Agents shifted slightly, but said nothing.

"I have been away a year," said Kleig, "as you know, and many things have come into regular use since I left. Professor Maniel's machine for example, upon which he was working when I departed under orders. There will be further use for it in our struggle with Moyen. Professor, will you kindly range the ocean, beginning at once, and see how many of these monsters of Moyen we have to contend with?"

Professor Maniel turned back to his instruments, which he fondled with gentle, loving hands.

"We have nothing with which to combat the attacking forces of Moyen," went on Kleig, "save antiquated airplanes, and such obsolete warships as are available. These will be mere fodder for the guns, or rays, or whatever it is that Moyen uses in his aero-subs. Thousands, perhaps millions, of human lives will be lost; but better this than that Moyen rule the West! Better this than that our women be given into the hands of this mob as spoils of war!"

From the Secret Agents a murmur of assent.

And then, that voice again, startling, clear, with the slightest suggestion of some Oriental accent, in the Secret Room.

"Do not depend too much, gentlemen," it said, "upon your antiquated warships! See, I am merciful, in that I do not allow you to send them against me loaded with men to be slaughtered or drowned! Professor Maniel, I would ask you to turn that plaything of yours and gaze upon the fleet of obsolete ships anchored in Hampton Roads! In passing, Professor, I venture to guess that the secret of how I am able to talk with you gentlemen, here in your Secret Room, is no secret at all to you. Now look!"

The Secret Agents gasped again, in consternation.

From the white lips of mouselike Maniel came mumbled words, even as his hands worked with lightning speed.

"His machine is simply a variation of my own. And, gentlemen, compatriots, with it he could as easily project himself, bodily, here into the room with us!"

Something like a suppressed scream from one of the men present. A cold hand of ice about the heart of Prester Kleig. But the words of Professor Maniel were limned on the retina of his brain in letters of fire. Suppose Moyen *were* to project himself into the Secret Room....

But he would not. He was no fool, and even these Secret Agents, most of whom were old and no longer strong, would have torn him limb from limb. But those words of Maniel set whirling once more, and in a new direction, the thoughts of Prester Kleig.

"Mr. President, gentlemen...." It was the voice of Professor Maniel.

All eyes turned again to the screen upon which the professor worked his miracles, which today were commonplaces, which yesterday had been undreamed of. Every Secret Agent recognized the outlines of Hampton Roads, with Norfolk and its towering buildings in the background, and the obsolete warships riding silently at anchor in the roadstead.

For three years they had been there, while a procrastinating Cabinet, Congress and Senate had debated their permanent disposal. They represented millions of dollars in money, and were utterly worthless. Prester Kleig, looking at them now, could see them putting out to sea, loaded with brave-visaged men, volunteering to go to sure destruction to feed the rapacity of Moyen's hordes. Men going out to sea in tubs, singing....

But these ships were silent. No plumes of smoke from their funnels. Like floating mausoleums, filled with dead hopes, shells of past and departed glories.

The beating of waves against their sides could plainly be heard. The anchor chains squeaked rustily in the hawse-holes. Wind sighed through regal, towering superstructures, and no man walked the decks of any one of them.

With bated breath the Secret Agents watched.

Why had Moyen bidden them turn their attention to these shells of erstwhile naval grandeur?

This time no gasps broke from the lips of the Secret Agents. Not even the sound of breathing could be heard. Just the sighing of wind through the superstructures of a hundred ships, the whispering of waves against rusted bulkheads.

Almost imperceptibly at first the towering dreadnought in the foreground began to move! Slowly, the water swirling about her, she backed away from her anchor, tightening the curve of the anchor chain! Water quivered about the point of the chain's contact with the waves!

Quickly the eyes of the Secret Agents swept along the street of ships. The same backward motion, of dragging against their anchor chains, was visible at the bow of each warship!

With not a soul aboard them, the ships were waking into strange and awesome life, dragging at their anchors, like hounds pulling at leashes to be free and away!

"How are they doing it?" It was almost a whisper from

the President.

"Some electro-magnetic force, sir!" stated Prester Kleig. "Professor Blaine, that is your province! Please note what is happening, and advise us at once if you see how they are doing it!"

A grunt of affirmation from surly, obese Professor Blaine.

All eyes turned back again to the miracle of the moving ships. One by one, with crashes which echoed and re-echoed through the Secret Room, the anchor chains of the dreadnoughts parted. The ends of them swung from the prows of the warships, while the severed portions splashed into the Roads, and the waters hid them from view.

The great dreadnought in the foreground swung slowly about until her prow was pointed in the direction of the open sea, and though no sea was running, no smoke rose from her funnels, she got slowly, ponderously under way, and started out the Roads. Behind her, in formation, the other ships

swung into line.

In a matter of seconds, faster than any of these vessels had ever traveled before, they were racing in column for the open Atlantic. And from the sound apparatus came wails and shrieks of terror, the lamentations of men and women frightened as they had never been frightened before.

The shores behind the moving column of ships was moment by moment growing blacker with people—a black sea of people, whose faces were white as chalk with terror.

But on, out to sea, moved the column of brave ships.

A new note entered into the picture, as from all sides airplanes of many makes swooped in, and swept back and forth over the moving ships, while hooded heads looked out of pits, and faces of pilots were aghast at what they saw.

A ghost column of ships, moving out to sea, speed increasing moment by moment unbelievably. Even

now, five minutes after the first dreadnought had started seaward, the wake of each ship spread away on either hand in the two sides of a watery triangle whose walls were a dozen feet high—racing for the shores with all the sullen majesty of tidal waves.

The crowds gave back, and their screams rose into the air in a frightened roar of appalling sound.

Even now, so rapidly did the warships travel, many of the planes could throttle down, so that they flew directly above the heaving decks of the runaway warships.

"Get word to them!" cried Prester Kleig suddenly.

"Get word to them that if they follow the ships out to sea not a pilot will escape alive!"

One of the Secret Agents rose and hurried from the Secret Room, traveling at top speed for the first of the many doors enroute to the broadcasting tower from which all the planes could be reached at once. Prester Kleig turned back to the magic screen of Maniel.

The warships, water thrown aside by the lifting thrust of their forefeet in mountains that raced landward with ever-increasing fury, were clearing the Roads and swinging south by east, heading into the wastes of the Atlantic. As they cleared the land, and open water for unnumbered miles lay ahead, the speed of the mighty ships increased to a point where they rode as high on the water as racing launches, and the creaking and groaning of their rusty bolts and spars were a continual paeon of protest in the sound apparatus accompanying the showing of the miracle on the screen.

"They're heading straight for the spot where that super-submarine lies!" said the President, and no one answered him.

Prester Kleig, watching, was racing over in his mind what he could recall of his country's armament. Warships were useless, as was being proved here before his eyes. But there still remained airplanes, in countless numbers, which could be diverted from ocean travel and from routine business, to battle this menace of Moyen.

But....

He shuddered as he pictured in his mind's eye the meeting of his country's flower of flying manhood with the monsters of Moyon.

His eyes, as he thought, were watching the racing of those ocean greyhounds, out to sea. They were now out of sight of land, and still some of the planes followed them.

A half hour passed, and then....

The American pilots, in obedience to the radio signals, turning back from this strange phenomenon of the ghost column of capital ships.

Simultaneously, out of the sky dead ahead, dropped the first flight of Moyon's aero-sub.

At the same moment the mysterious power which had dragged the ships to sea was withdrawn, and the warships, with no hands to guide them, swung whither they willed, and floated in as many directions

as there were ships, under their forward momentum. There were a score of collisions, and some of the ships were in sinking condition even before the aero-sub began their labors.

The remaining ships floated high out of the water, because they carried no ballast, and from all sides the aero-sub of Moyon settled to the task of destruction—destruction which was simply a warning of what was to come: Moyon's manner of proving to the Americas the fact that he was all-powerful.

"God, what fools!" cried Prester Kleig.

The rearmost of the American aviators had looked back, had seen the first of the aero-sub drop down among the doomed ships. Instantly he turned out to sea again, signalling as he did so to the nearest other planes. And in spite of the radio warning a hundred planes answered that signal and swept back to investigate this new mystery.

"They're going to death!" groaned the President.

"Yes," said Kleig, softly, "but it saves us ordering others to death. Perhaps we may learn something of value as we watch them die!"

Chapter 7: *Golden Oblivion*

"This," said Prester Kleig, as coldly precise as a judge pronouncing sentence of death, "will precipitate the major engagement with Moyen's forces. The fools, to rush in like this, when they have been warned! But even so, they are magnificent!"

The pilots of the aero-sub's must instantly have noticed the return of the American pilots, for some of the aero-sub's which had dropped to the ocean's surface rose again almost instantly, and swept into battle formation above the drifting hulks of the warships.

The Americans were wary. They drew together like frightened chickens when a hawk hovers above them, and watched the activities of the aero-sub's, every move of each one being at the same time visible and audible to the Secret Agents in the Capitol's Secret

Room.

The aero-sub which had submerged singled out their particular prey among the floating ships, and the Secret Agents, trying to see how each separate act of destruction was accomplished, watched the aero-sub in the foreground, which happened to be concentrating on the dreadnought which had led the ghost-march of the warships out to sea.

The aero-sub circled the swaying dreadnought as a shark circles a wreck, and through the walls of the aero-sub the watchers in the Secret Room could see the four-man crew of the thing. Grim faced men, men of the Orient they plainly were, coldly concentrating on the work in hand. Their faces were those of men who are merciless, even brutal, with neither heart nor compassion of any kind for weaker ones. One man maneuvered the aero-sub, while the other three concentrated on the apparatus in the nose of the hybrid vessel.

"See," spoke Prester Kleig again, "if you can tell what manner of ray they use, and how it is projected.

That's your province, General Munson!"

From the particular Secret Agent named, who was expert for war in the membership of the Secret Room, came a short grunt of affirmation. A few murmured words.

"I'll be able to tell more about it when I see how they operate when they are flying. That black streak under water ... well, I must see it out of the water, and then...."

But here General Munson ended, for the aero-sub which they were especially watching had got into action against the dreadnought.

The aero-sub was motionless and submerged just off the port bow of the dreadnought. The three men inside the aero-sub were working swiftly and efficiently with the complicated but minute machinery in the nose of their transport.

"It can be controlled, then, this ray," said Munson, interrupting himself. "Watch!"

From the nose of the aero-sub leaped, like a streak of black lightning, that ebon agency of death. It struck the prow of the battleship—and the prow, as far aft as the well-deck, simply vanished from sight, disintegrated! It was as though it had never been, and for a second, so swiftly had it happened, the water of the ocean held the impression that portion of the warship had made—as an explosive leaves a crater in the soil of earth!

Then a drumming roar as the sea rushed in to claim its own. The roaring, as of a Niagara, as the waters claimed the ship, rushing down passageways into the hold, possessing the warship with all the invincible, speedy might of the sea.

Mingled with this roaring was the shivering, vibratory sound which Prester Kleig had experienced in his half-dream. The sound was so intense that it fairly rocked the Secret Room to its furthestmost cranny.

For a second the dreadnought, wounded to death, seemed to shudder, to hesitate, then to move backward as though wincing from her death blow. It

was the pound of the intrushing waters which did it. Then up came the stern of the mighty ship, as she started her last long plunge into the depths.

But attention had swung to another warship, on the starboard beam of which another aero-sub had taken up position. Again the ebon streak of death from her blunt nose, smashing in and through the warship, directly amidships, cutting her in twain as though the black streak had been a pair of shears, the warship a strip of tissue paper.

Up went the prow and the stern of this one, and together, the water separating the two parts as it rushed into the gap, the broken warship went down to its final resting place.

Abruptly Professor Maniel swung back to the American planes which had come back to investigate the activities of the aero-sub, and on the screen, in the midst of the battle formation into which the pilots had swept to hurriedly, the Secret Agents could see the faces of those pilots....

White as chalk with fear, mouths open in gasping unbelief. One man, a pale-faced youth, was the first to recover. He stared around at his compatriots, and plainly through the sound apparatus in the Secret Room came his swift radio signals.

"Attack! Who will follow me against these people?"

His signals were very plain. So, too, were the answers of the other pilots, and the heart of Prester Kleig swelled with pride as he listened to the answering signals—and counted them, discovered that every last pilot there present elected to stay with this youngster, to avenge their country for this contemptuous insult which had been put upon her by the rape of Hampton Roads.

Into swift formation they swept, and with these planes—all planes in use were required by franchise of operating companies to be equipped for the emergencies of war—swung into an echelon formation, the youthful pilot leading by mutual consent.

They swept at full speed toward the warships, four of which had by this time been sent to destruction—one of which had appeared to vanish utterly in the space of a single heartbeat, so quickly that for a second or two the shape of its bilge, the bulge of its keel, was visible in the face of the deep—and openly challenged the aero-sub.

Muzzles of compressed air guns projected from the wing-tips of the planes. Buttons were pressed which elevated the muzzles of guns arranged to fire upward from either side the fighting pits, twin guns that were fired downward from the same central magazine—the only guns in use in the Americas which fired in opposite directions at the same time.

But for a few moments the aero-sub refused combat. Their speed was terrific, dazzling. They eluded the thrusts, the dives and plunges of the American ships as easily as a swallow eludes the dive of a buzzard.

It came to Prester Kleig, however, that the aero-sub were merely playing with the Americans; that when they elected to move, the planes would be blasted

from the sky as easily as the warships were being erased from the surface of the Atlantic.

One by one, as methodically as machines, the aero-sub pilots blasted the warships into nothingness. They had their orders, and they went about their performance with a rigidity of discipline which astounded the Secret Agents. They had been ordered to destroy the warships, and they were doing that first—would go on to completion of this task, no matter how many American planes buzzed about their ears.

But one by one as the warships sank, the aero-sub which had either sunk or erased them made the surface and leaped into space with a snapping back of wings that was horribly businesslike as to sound, and climbed up to take part in the fight against the American planes, which must inevitably come.

The last warship, cut squarely in two from stem to stern along her center, as though split thus by a bolt of lightning, fell apart like pieces of cake, and splashed down, sinking away while the spume of her

disintegration rolled back from her fallen sides in white-crested waves.

"It exemplifies the policies of Moyen," said Prester Kleig, "for his conquest of the world is a conquest of destruction."

The last aero-sub took to the sky, and the Americans rushed into battle with fine disregard for what they knew must be certain death. They were not fools, exactly, and they had seen, but not understood, the manner in which those gallant old hounds of the sea had been erased from existence.

But in they went, plunging squarely into the heart of the aero-sub's leading formation, which formation consisted of three aero-sub's, flying a wing and wing formation.

The young American signaled with upraised hand, and the American pilots made their first move. Every plane started rolling, at dazzling speed, on the axis of its fuselage, while bullets spewed from the guns that fired through the propellers.

Bullets smashed into the leading aero-sub, with no apparent effect, though for a second it seemed that the central aero-sub of the leading formation hesitated for a moment in flight.

Then, swift as had that black streak flashed from the nose of aero-sub submerged, a streak darted from the nose of the central aero-sub, and glistened in the sun like molten gold!

It touched the youngster who had called for volunteers for his attack against this strange enemy. It touched his plane—and the plane vanished instantly, while for a fraction of a second the pilot was visible in his place, in the posture of sitting, hand on a row of buttons which did not exist, head forward slightly as he aimed guns that had vanished.

Then the pilot, still living, apparently unhurt, plunged down eight thousand feet to the sea. The water geysered up as he struck, then closed over the spot, and the gallant American youngster had become the first victim in battle of the monsters of Moya.

Victim of a slender lancet of what seemed to be golden lightning.

"He could have killed the pilot aloft there," came quietly from Munson, "but he chose to pull his plane away from around him! Their control of the ray is miraculous!"

As though to confirm the statement of Munson, the leading aero-sub struck again, a second plane. The plane vanished, but from the spot where it had flown, not even a bit of metal or of man sufficiently large to be seen by the delicate recording instruments of Maniel dropped out of the sky.

The ray of gold was a ray of oblivion if the minions of Moyen willed.

Chapter 8: *Charmion*

"Prester Kleig," came suddenly into the Secret Room the voice of far distant Moyan, "you will at once make a change in your rules regarding the admission of other than Secret Agents to the Secret Room. You will at once see that Charmion Kane, sister of your friend, is allowed to enter!"

"God Almighty!" A cry of agony from the lips of Prester Kleig. He had not forgotten Charmion, but simply had had to move so swiftly that he had put her out of his mind. For a year he had not seen her, and an hour or two more could not matter greatly.

"And her brother Carlos," went on the voice, "see that he, too, is admitted. I wish, for certain reasons, that Charmion come unharmed through the direct attack I am about to make against your country. I confess that, save for this ability to speak to you, I am unable to work any damage to the Secret Room, which is therefore the safest place for Charmion Kane! Carlos Kane is being spared because he is her brother!"

There was no mistaking the import of this sinister command from Moyen. He had singled out Charmion, the best beloved of Prester Kleig, for his attentions, and that he was sure of the success of his attack against the United Americas was proved by the calm assurance of his voice, and the fact that, concentrating on the attack as he must be, he still found time for a thought of Charmion Kane.

The hand of ice which had seldom been absent from the heart of Kleig since he had first seen and heard the voice of Moyen gripped him anew. Blood pounded maddeningly in his temples. Cold sweat bathed his body.

But the rest of the Secret Agents, save to freeze into immobility when the hated voice spoke, gave no sign. They had worries of their own, for no instructions had been given that they bring their own loved ones into the sanctuary of the Secret Room.

As though answering the thoughts of the others, the hated voice spoke again.

"I regret that I cannot arrange for sanctuary for the loved ones of all of you, for you are gallant antagonists; why save the few, when the many must perish? For I know you will not surrender, however much I have proved to you that I am invincible. But Charmion Kane must be saved."

"God!" whispered Kleig. "God!"

Then spoke General Munson.

"I think this ray which the Moyenites use is a variation of the principle used in the intricate machinery of Professor Maniel, though how they render it visible I do not know. But it doesn't matter, and may be only a blind! You'll note that when the black streak, or the golden ray, strikes anything that thing instantly disintegrates. A certain pitch of resonance will break a pane of glass. It's a matter of vibration, solely, wherein the molecules composing any object animate or inanimate, are hurled in all directions instantaneously.

"Professor Maniel's apparatus, the Vibration-Retarder,

is able to recapture the vibrations, speeding outward endlessly through space, and to reconstruct, and *draw back* to visibility the objects destroyed by this visible vibratory ray, whatever it is. This problem, then, falls into the province of Professor Maniel!"

Through the heart and soul of Prester Kleig there suddenly flowed a great surge of hope.

"General Munson, if you will operate the machinery of the Vibration-Retarder, I wish to talk with Professor Maniel!"

Instantly, efficiently, without a word in reply to the eager command of Prester Kleig, General Munson relieved Professor Maniel at the apparatus which Maniel called the Vibration-Retarder, his invention which he had combined with audible televue to complete this visual miracle of the Secret Room. Professor Maniel stepped to where Prester Kleig was sitting.

Prester Kleig put fingers to his lips for silence, and an expression of surprise crossed the wrinkled dead-

white face of the Professor.

Before Kleig could speak, however, there came a signal from somewhere outside the Secret Room, a signal which said that the doors were being opened and that a personage was coming. The Secret Agents looked at one another in surprise, for every man who had a right to be inside the Secret Room was already present.

"I know," said Kleig, his face a mask of terror. "It is Charmion and Carlos Kane! Moyen, the devil, has managed to make sure of obedience to his orders!"

The Secret Agents turned back to the screen, upon which the view of the first aerial brush of the American flyers with the minions of Moyen, in their aero-sub, was drawing to a terrible close.

For, as the aero-sub commanders had played with the warships, which had no human beings aboard them, so now did they play with the planes of the Americas.

One American flyer, startled into a frenzy by the fate

of his fellows, put his helicopter into action, and leaped madly out of the midst of the battle. Instantly an aero-sub zoomed, skyward after him. Again that golden streak of light from the nose of an aero-sub, and the helicopter vanes and the slender staff upon whose tip they whirled vanished, shorn short off above the vane-grooves in the top of the wing!

The plane dropped away, fluttering like a falling leaf for a moment, before the aviator started his three propellers again.

A cheer broke from the lips of Prester Kleig as he watched. The commander of that particular aero-sub, apparently contemptuous of this flyer who had tried to cut out of the fight, allowed him to fall away unmolested—and the American, driven berserk by the casual, contemptuous treatment accorded him by this strange enemy, zoomed the second his propellers whirred into top-speed action, and raced up the sky toward the belly of the aero-sub.

"If only the aero-sub has a blind spot!" cried Prester Kleig.

In that instant a roaring crash sounded in the Secret Room as the American plane, going full speed, crashed, propellers foremost, into the belly of the aero-sub.

And the aero-sub, whose brothers had seemed until this moment invincible, did not escape the wrath of the American—though the American went into oblivion with it!

For, welded together, American plane and aero-sub started the eight thousand feet plunge downward to the sea!

"Watch!" shrieked Munson. "Watch!"

As the aero-sub and the plane plunged down through the formation of fighters, the aero-sub pilots saw it, and they fled in wild dismay and at top speed from their falling compatriot. Why? For a moment it was not apparent. And then it was.

For out of the body of the doomed aero-sub came sheets of golden flame! Not the flames of fire, but the

golden sheen of that streak which the aero-sub had used against the American planes already out of the fight! The American flyer had crashed into the container, whatever it was, that harnessed the agency through which the minions of Moyon had destroyed the *Stellar*, and the battleships raped from Hampton Roads!

"It is liquid, then!" shrieked Munson.

And it seemed to be. For a second the golden mantle, strange, awe-inspiring, bathed and rendered invisible the aero-sub and the plane which had slain her. Then the golden flame vanished utterly, instantly—and in the air where it had been there was nothing! The aero-sub was gone, and the plane whose mad charge had erased her.

"Her own death dealing agency destroyed her!" shrieked Munson. "And the other aero-sub cut away from the fight to save themselves, because they too carry death and destruction within them!"

Then the inner door of the Secret Room opened and

two people entered. One of them, a dazzling beauty with glorious black hair and the tread of a princess, a picture of perfection from jeweled sandals to coiffured hair, was Charmion Kane. Behind her came her brother, whose face was chalky white. But Charmion, as she crossed to Kleig and kissed him, while her eyes were luminous with love, held her head proudly high, imperious.

"I know," she said softly to Kleig, "and I am not afraid! I know you will prevent it!"

Kleig waved the two to chairs and turned again to Professor Maniel.

On a piece of paper he wrote swiftly, using a mode of shorthand known only to the Secret Agents.

"Professor," he wrote feverishly, "can you reverse the process used in your Vibration-Retarder? Tell me with your eyes, for Moyen may even know this writing, and I am sure he hears what we say here, may even be able to see us?"

Professor Maniel started and stared deeply into the eyes of Prester Kleig. His face grew thoughtful. He brushed his slender hand over the massive dome of his brow. Hope burned high in the heart of Prester Kleig.

Then, despite Kleig's instructions to answer merely by the expression in his eyes, Professor Maniel leaned forward and wrote quickly on the piece of paper Kleig had used.

"Two hours!"

Nothing else, no explanations; but Prester Kleig knew. Maniel believed he could do it, but he needed two hours in which to perfect his theory and make it workable. Kleig knew that had he been able to do it in two years, or two decades, it still would have been in the nature of a miracle.

But two hours....

And Moyen had said that he was preparing to attack at once.

In two hours Moyer, unless the Americas fought against him with every resource at their command, could depopulate half the Western World. Kleig looked back to the screen.

There was not a single American plane in the sky above the graveyard of those vanished warships. And the aero-sub, swift flying as the wind, were racing back to the mother ship, scores of miles away.

Munson worked with the Vibration-Retarder, the Sound-and-Vision devices, ranging the sea off the coast to either side of that huge, suspended fortress which was the mother submarine of the aero-sub.

Gasps of terror, though the sight was not unexpected, broke from the lips of every person in the Secret Room.

For super-monsters of Moyer were moving to the attack.

Chapter 9: Flowers of Martyrdom

For a minute the Secret Agents were appalled by the air of might of the deep-sea monsters of Moyen, brought bodily, almost into the Secret Room by the activities of General Munson at the Sound-and-Vision apparatus.

Off the coast, miles away, yet looming moment by moment larger, indicating the deceptively swift speed of the monsters, were scores of the great under-water fortresses, traveling toward the coast of the United Americas in a far-flung formation, each submarine separated from its neighbor to right and left by something like a hundred miles, easy cruising radius for the little aero-subbs carried inside the monsters.

That each submarine did carry such spawn of Satan was plainly seen, for as the great submarines moved landward, scores of aero-subbs sported gleefully about the mother ships. There was no counting the number of them.

Two hours Maniel needed for his labors, which meant

that for two hours the flower of the country's manhood must try to hold in check the mighty hordes of Moyen.

"Somewhere there," stated Prester Kleig, "in one or the other of those monsters, is Moyen himself. I know that since he wished Charmion saved for his attentions! Do your work with your apparatus, Munson, while I go out to the radio tower to broadcast an appeal for volunteers. Charmion—Carlos...."

But Prester Kleig found that he could not continue. Not that it was necessary, for Charmion and Carlos knew what was in his mind. Charmion was a lady of vast intelligence, from whom life's little ironies had not been hidden—and Kane and Kleig had already discussed the activities of Moyen where women were concerned.

Prester Kleig hurried to the Central Radio Tower, and as he passed through each of the many doors leading out to the roof of the new Capitol Building the guards at the doors left to form a guard for him, at this

moment the most precious man in the country, because he knew best the terrible trials which faced her.

The country was in turmoil. It seemed almost impossible that a whole day had passed since Prester Kleig had returned and entered the Secret Room. In the meantime a fleet of battleships had been drawn by some mysterious agency out to sea from Hampton Roads, and a fleet of fighting planes which had followed the ghost column outward had not returned.

News-gatherers had spread the stories, distorted and garbled, across the western continents, and throughout the western confederacy men, women and children lived in the throes of the greatest fear that had ever gripped them. Fear held them most because they could not give the cause of their fear a name—save one....

Moyen.... And the name was on the lips of everyone, and frenzied woman stilled their squalling babes with its mention.

No word yet from the Secret Room, but Prester Kleig had scarcely appeared from it than someone started the radio signal which informed the frenzied, waiting world of the west that information, exact if startling, would now be forthcoming.

In millions of homes, in thousands of high-flying planes, listeners tuned in at the clear-all hum.

Prester Kleig wasted no time in preliminaries.

"Prester Kleig speaking. We are threatened by Moyen, with scores of monster submarines, each a mother ship for scores of aero-subs, combinations of airplanes and miniature submarines. They are moving up on our eastern coast, from some secret base which we have not yet located. They are equipped with death dealing instruments of which we have but the most fragmentary knowledge, and for two hours I must call upon all flyers to combat the menace; until the Secret Agents, especially Professor Maniel, have had opportunity to counteract the minions of Moyen.

"Flyers of the United Americas! In the name of our

country I ask that volunteers gather on the eastern coast, each flyer proceeding at once to the nearest coast-landing, after dropping all passengers. Your commanders have already been named by your various organizations, as required by franchise, and orders for the movement of the entire winged armada will come from this station. However, the orders will simply be this: Hold Moyen's forces at bay for a period of two hours! And know that many of you go to certain death, and make your own decisions as to whether you shall volunteer!"

This ended, Prester Kleig, excitement mounting high, hurried back to the Secret Room.

Now the public knew, and as the American public is given to doing, it steadied down when it knew the worst. Fear of the unknown had changed the public into a myriad-souled beast gone berserk. Now that knowledge was exact men grew calm of face, determined, and women assumed the supporting role which down the ages has been that of brave women, mothers of men.

A period of silence for a time after Prester Kleig's pronouncement.

As he entered the first door leading into the Secret Room, Carlos Kane met and passed him with a smile.

"You called for winged volunteers, did you not, Kleig?" he asked quietly.

Kleig nodded. "You are going?" he said.

"Yes. It is my duty."

No other words were necessary, as the men shook hands. Prester Kleig going on to the Secret Room, Carlos Kane going out to join the mighty armada which must fight against the minions of Moyon.

The words of Prester Kleig were heard by the pilots of the sky-lanes. The passenger pits, equipped with self-opening parachutes which dropped jumpers in series of long falls in order to acquire swift but accurate and safe landing—they opened at intervals in long falls of two thousand feet, stayed the fall, then closed again,

so that drops were almost continuous until the last four hundred feet—and pilots, swiftly making up their minds, dropped their passengers, banked their planes, and raced into the east.

All over the Americas pilots dropped their passengers and their loads if their franchises called for the carrying of freight, and banked about to take part in the first skirmish with the Moyenites.

Dropping figures almost darkened the sky as passengers plunged downward after the startling signal from Washington. Flowers, which were the umbrellas of chutes, opened and closed like breathing winged orchids, letting their burdens safely to earth.

And clouds and fleets of airplanes came in from all directions to land, in rows and rows which were endless, wing and wing, along the eastern coast.

Prester Kleig had scarcely entered the Secret Room than the hated voice of Moyen again broke upon the ears of the machinelike Secret Agents.

"This is madness, gentlemen! My people will annihilate yours!"

But, since time for speech had passed, not one of the Secret Agents made answer or paid the slightest heed to the warning, though deep in the heart of each and every one was the belief that Moyon spoke no more than the truth.

Too, there was a growing respect for the half-god of Asia, in that he was good enough to warn them of the holocaust which faced their country.

By hundreds and thousands, wing and wing, airplanes dropped to the Atlantic coast at the closest point of contact, when the signal reached them. At high altitudes, planes crossing the Atlantic turned back and returned at top speed, dropping their passengers as soon as over land. That Moyon made no move to prevent the return of flyers out over the ocean, and now coming back, was an ominous circumstance.

It seemed to show that he held the American flyers, all of them, in utter contempt.

Prester Kleig regarded the time. It had been half an hour since Moyen had spoken of attack, half an hour since the monsters of the deep had started the inexorable move toward land. On the screen the submarines were bulking larger and larger as the moments fled, until it seemed to the Secret Agents that the great composite shadow of them already was sweeping inland from the coast.

As the coast came close ahead of the monster subs the little aero-subs, to the surprise of the Secret Agents, all vanished into their respective mother ships.

"But they have to use them," groaned Munson. "For their submarines are useless in frontal attack against our shores!"

"I am not so sure of that," said Prester Kleig. "For I have a suspicion that those submarines have tractors under their keels, and that they can come out on land! If this is so the monsters can, guarded by armour-plate, penetrate to the very heart of our most populated areas before their aero-subs are released."

None of the Secret Agents as yet had stopped to ponder how the monsters had reached their positions, and why Moyen was attacking from the east, when the Pacific side of the continents would have appeared to be the obvious point of attack, and would have obviated the necessity of long, secret under-sea journeys wherein discovery prematurely must have been one of the many worries of the submarine commanders.

The mere fact of the presence of the monsters was enough. What had preceded their presence was unimportant, save that their presence, and their near approach to the shore undetected, further proved the executive and planning genius of Moyen.

Two miles, on an average, off the eastern coast the submarines laid their eggs—the aero-subs, which darted from the sides of the mother ships in flights and squadrons, made the surface, and leaped into the sky.

Five minutes later and the signal went forth to the phalanx of the volunteers.

"Take off! Fly east and engage the enemy, and hold him in check, and the God of our fathers go with you!"

One hour had passed since Moyen's ultimatum when the first vanguard of the American flyers, obeying the peremptory signal, took the air and darted eastward to meet the winged death-harbingers of Moyen.

Chapter 10: "They Shall Not Pass!"

Prester Kleig's heartfelt desire, as the American flyers closed with the first of the aero-sub, was to go out with them and aid them in the attack against the Moyenites. But he knew, and it was a tacit thing, that he best served his country from the safe haven of the Secret Room.

As he watched the scenes unfold on the screen of Maniel's genius, with occasional glances at the somewhat mysterious but profound and concentrated labors of Maniel, Charmion Kane rose from her place and came to his side.

Wide-eyed as she watched the joining of battle, she stood there, her tiny hand encased in the tense one of Prester Kleig.

"You would like to be out there," she murmured. "I know it! But your country needs you here—and I have already given Carlos!"

Prester Kleig tightened his grip on her hand.

There was deep, silent understanding between these two, and Prester Kleig, in fighting against the Moyenites, realized, even above his realization that his labors were primarily for the benefit of his country, that he really matched wits with Moyen for the sake of Charmion. Had anyone asked him whether he would have sacrificed her for the benefit of his country, it would have been a difficult question to answer.

He was glad that the question was never asked.

"Yes, beloved," he whispered, "I would like to be out there, but the greatest need for me is here."

But even so he felt as though he was betraying those intrepid flyers he was sending to sure death. Yet they had volunteered, and it was the only way.

Maniel, a gnomelike little man with a Titan's brain, labored with his calculations, made swiftly concrete his theories, while at the Sound-and-Vision apparatus excitable General Munson ranged the aerial battlefield to see how the tide of battle ebbed and

flowed.

That neither side would either ask or give quarter was instantly apparent, for they rushed head-on to meet each other, those vast opposing winged armadas, at top speed, and not a single individual swerved from his course, though at least the Americans knew that death rode the skyways ahead.

Then....

The battle was joined. Moyen's forces were superior in armament. Their sky-steeds were faster, more readily maneuverable, though the flying forces of the Americas in the last five years had made vast strides in aviation. But what the Americans lacked in power they made up for in fearless courage.

The plan of battle seemed automatically to work itself out.

The first vanguard of American planes came into contact with the forces of Moyen, and from the noses of countless aero-sub's spurted that golden streak

which the Secret Agents knew and dreaded.

The first flight of planes, stretching from horizon to horizon, vanished from the sky with that dreadful surety which had marked the passing of the *Stellar*, and such of those warships as had felt the full force of the visible ray.

From General Munson rose a groan of anguish. These convertible fighting planes had been the pride of the heart of the old warrior. To do him credit, however, it was the wanton, so terribly inevitable destruction of the flyers themselves which affected him. It was so final, so absolute—and so utterly impossible to combat.

"Wait!" snapped Prester Kleig.

For the intrepid flyers behind that vanguard which had vanished had witnessed the wholesale disintegration of the leading element of the vast armada, and the pilots realized on the instant that no headlong rush into the very noses of the aero-sub would avail anything.

The vast American formation broke into a mad maelstrom of whirling, darting, diving planes. Every third plane plummeted downward, every second one climbed, and the remaining ships, even in the face of what had happened to the vanished first flight, held steadily to the front.

In this mad, seemingly meaningless formation, they closed on the aero-sub. Without having seen the fight, the Americans were aping the action of that one nameless flyer who had charged the aero-sub that had been destroyed.

Kleig remembered. A score of ships had been destroyed utterly above the graveyard of dreadnoughts, yet only one aero-sub, and that quite by chance, had been marked off in the casualty column.

Death rode the heavens as the American flyers went into action. For head-on fights, flyers went in at top speed, their planes whirling on the axes of fuselages, all guns going. Planes were armored against their own bullets, and they were not under the necessity of

watching to see that they did not slay their own friends.

Even so, bullets were rather ineffective against the aero-sub, whose apparently flimsy, almost transparent outer covering diverted the bullets with amazing ease.

A whirling maelstrom of ships. The monsters of Moyon had drawn first blood, if the expression may be used in an action where no blood at all was drawn, but machines and men simply erased from existence.

Hundreds of planes already gone when the second flight of ships closed with the aero-sub. Yellow streaks of death flashed from aero-sub nostrils, but even as aero-sub operators set their rays into motion the American flyers in head-on charge rolled, dived or zoomed, and kept their guns going.

High above the first flight of aero-sub, behind which another flight was winging swiftly into action, American flyers tilted the noses of their planes over and dived under full power—to sure death by suicide,

though none knew it there at the moment.

These aero-subbs could not be driven from the sky by usual means, and could destroy American ships even before those planes could come to handgrips; but they, the flyers plainly believed, could be crashed out of the sky and so, never guessing what besides death in resulting crashes they faced, the flyers above the aero-subbs, even as aero-subbs in rear flashed in to prevent, dived down straight at the backs of the aero-subbs.

In a hundred places the dives of the Americans worked successfully, and American planes crashed full and true, full power on, into the backs of the "flying fish." In some aero-subbs the container of the Moyon-dealing agency apparently remained untouched, and airplanes and aero-subbs, welded together, plunged down the invisible skylanes into the sea.

Under water, some of the aero-subbs were seen to keep in motion, limping toward the nearest mother submarines.

"I hope," said Prester Kleig, "the American flyers in such cases are already dead, for Moyen will be a maniac in his tortures. Munson, do you hurriedly examine the mother-subbs and see if you can locate Moyen."

However, only a scattered aero-sub here and there went down without the strange substance of the yellow ray being released. In most cases, upon the contact of plane with aero-sub, the aero-subbs and planes were instantly blotted from view by the yellow, golden flames from the heart of the winged harbingers of Moyen.

Golden flames, blinding in their brightness, dropping down, mere shapeless blotches, then fading out to nothingness in a matter of seconds—with aero-sub and airplane totally erased from action and from existence.

The American flyers saw and knew now the manner of death they faced. Yet all along the battle front not an American tried to evade the issue and draw out of the fight. A sublime, inspiring exhibition of mass courage

which had not been witnessed down the years since that general engagement which men of the time had called the Great War.

Prester Kleig turned to look at Maniel. Drops of perspiration bathed the cheeks of the master scientist, but his eyes were glowing like coals of fire. His face was set in a white mask of concentration, and Prester Kleig knew that Maniel would find the answer to the thing he sought if such answer could be found.

Would the American flyers be able to hold off the minions of Moyen until Maniel was ready? The fight out there above the waters was a terrible thing, and the Americans fought and died like men inspired, yet inexorably the winged armada of Moyen, preceded by those licking golden tongues, was moving landward.

"Great God!" cried Munson. "Look!"

There was really no need for the order, for every Secret Agent saw as soon as did Munson. Under the sea, just off the coast, the mother-subbs had touched

their blunt nose against the upward shelving of the sea bottom—had touched bottom, and were slowly but surely following the underwater curve of the land, up toward the surface, like unbelievable antediluvian monsters out of some nightmare.

"Yes," said Kleig quietly, "those monsters of Moyen can move on land, and the aero-subs can operate from them as easily on land as under water."

Kleig regarded the time, whirled to look at Professor Maniel.

One hour and forty minutes had passed since Maniel had begged for two hours in which to prepare some mode of effectively combatting the might of Moyen. Twenty minutes to go; yet the mother-subs would be ashore, dragging their sweating, monstrous sides out of the deep, within ten minutes!

Ten minutes ashore and there was no guessing the havoc they could cause to the United Americas!

"Hurry, Maniel! Hurry! Hurry!" said Prester Kleig.

But he spoke the words to himself, though even had he spoken them aloud Maniel would not have heard. For Maniel, for two hours, had closed his mind to everything that transpired outside his own thoughts, devoted to foiling the power of Moyon.

"I've found him!" snapped Munson.

He pointed with a shaking forefinger to one of the mother-subs crawling up the slant of the ocean bed, twisted one of the little nubs of the Sound-and-Vision apparatus, and the angelic face and Satanic eyes, the twisted body, of Moyon came into view.

The face was calm with dreadful purpose, and Moyon stood in the heart of one of his monsters, his eyes turned toward the land. With a gasp of terror, dreadfully afraid for the first time, Prester Kleig turned and looked into the eyes of Charmion....

"No," she said. "It will never happen. I have faith in you!"

There were still ten minutes of the two hours left

when the mother-subbs broke water and started crawling inland, swiftly, surely, without faltering in the slightest as they changed their element from water to land.

As though their appearance had been the signal, the aero-subbs in action against the first line of American planes broke out of the one-sided fight and dived for their mother ships, while a mere handful of the American planes started back for home to prepare anew to continue the struggle.

Prester Kleig gave the signal to the second monster armada which had remained in reserve.

"Do everything in your power to halt the march of Moyer's amphibians!"

Ten minutes to go, and Professor Maniel still labored like a Titan.

Chapter 11: Caucasia Falls Silent

As the scores of amphibian monsters came lumbering

forth upon dry land it became instantly apparent why the aero-sub had returned to the mother ships. For a few moments, out of the water, the amphibians were almost helpless, with practically no way of attack or defense—as helpless as huge turtles turned legs up.

But as each aero-sub entered its proper slot in the side of the mother amphibian, it was turned about and the nose thrust back into the opening, which closed down to fit tightly about the nose of the aero-sub, so that those flame-breathing monsters protruded from the sides of the amphibians in many places—transforming the amphibians into monsters with hundreds of golden, licking tongues!

As, with each and every aero-sub in place, the amphibians started moving inland, Professor Maniel made his first move. With the tiny apparatus upon which he had been working, he stepped to the table before the Sound-and-Vision apparatus and spoke softly to his compatriots.

"Gentlemen," he said, "I have finished, and it will work effectively!"

Though Maniel spoke softly, it was plain to be seen that he was proud of his accomplishment, which remained only to be attached to start performance.

A matter of seconds....

Yet during those seconds was the real might, the real power for utter devastation, of Moyon fully exposed!

The amphibians got under way as the airplanes of the Americas swept into the fight.

From the sides of the monsters licked out those golden tongues of flame—and from the front.

Half a dozen amphibians slipped into New York from the harbor side and started into the heart of the city. And between the time when Maniel had said he was ready and the moment when he made his first active move against Moyon, a half-dozen skyscrapers vanished into nothingness, the spots where they had stood swept as clear of debris as though the land had never been reclaimed from Nature!

None was ever destined to know how many lives were lost in that first attack of the monsters of the golden, myriad tongues; but the monsters struck in the midst of a working day when the skyscrapers were filled with office workers.

And resolve struck deep into the hearts of the Secret Agents: if Moyon were turned back, he must be made to pay for the slaughter.

A matter of seconds....

Then a moment of deathly silence as Munson gave way at the screen for the gnomelike little Professor Maniel.

"Now, gentlemen!" snapped Maniel. "If my theory is correct," manipulating instruments with lightning speed as he talked, "the reversion of the principle of my Vibration-Retarder—which captures vibrations speeding outward from the earth and transforms them once again into sound and pictures audible and visible to the human ear—this apparatus will disintegrate the monsters as our boats and planes

were disintegrated!

"In this I have even been compelled to manipulate in the matter of time! I must not only defeat and annihilate the minions of Moyen, but must work from a mathematical absurdity, so that at the moment of impact that moment itself must become part of the past, sufficiently remote to remove the monsters at such distance from the earth that not even the mighty genius of Moyen can return them!"

The whirring, gentle as the whirring of doves' wings. In the center of the picture on the screen were those half-dozen amphibians laying waste Manhattan. Maniel set his intricate, delicate machinery into motion.

Instantly the amphibians there seemed to become misty, shadowy, and to lift out of Manhattan up above the roof-tops of skyscrapers still remaining, nebulous and wraithlike as ghost-shrouds—yet swinging outward from the earth with speed almost too swift for the eye to detect.

But where the amphibians had rested there stood, reclined—in all sorts of postures, surprising and even a bit ridiculous—the men of Moyen who had operated the monsters of Moyen!

From the Central Radio tower went forth a mighty voice of command to the planes which had been engaging the aero-sub's off the coast.

"Slay! Slay!"

Down flashed the planes of the Americas, and their guns were blazing, inaudibly, but none the less deadly of aim and of purpose, straight into the midst of the men of Moyen who had thus been left marooned and almost helpless with the vanishing of their amphibians.

And, noting how they fell in strangled, huddled heaps before the vengeful fire of the American planes, the Secret Agents sighed, and Maniel, his face alight with the pride of accomplishment, switched to another point along the coast.

And as a new group of the monsters of Moyon came into view, and Maniel bent to his labors afresh, the hated voice of the master mobster broke once more in the Secret Room.

"Enough, Kleig! Enough! We will surrender to save lives! I stipulate only that my own life be spared!"

To which Prester Kleig made instant reply.

"Did you offer us choice of surrender? Did you spare the lives of our people which, with your control of your golden rays, you could easily have done? No! Nor will we spare lives, least of all the life of Moyon!"

The whirring again, as of the whirring of doves' wings. More metal monsters, even as golden tongues spewed forth from their many sides, vanished from view, leaping skyward, while the operators of them were left to the mercies of the remaining airmen of the Americans.

Voicelessly the word went forth:

"Slay! Slay!"

It was Charmion who begged for mercy for the vanquished as, one by one, as surely as fate, the monsters with their contained aero-sub's were blotted out, leaving pilots and operators behind them. Down upon these dropped the airmen of the West, slaying without mercy....

"Please, lover!" Charmion whispered. "Spare them!"

"Even...?" he began, thinking of Moyon, who would have taken Charmion. He felt her shudder as she read his mind, understood what he would have asked.

"There he is!" came softly from Munson.

An amphibian had just been disintegrated, had just climbed mistily, swiftly, into invisibility in the skies. And there in the midst of the conquerors left behind, his angel's face set in a moody mask, his pale eyes awful with fear, his misshapen body sagging, terrible in its realization of failure, was Moyon!

Even as Kleig prepared to give the mercy signal, a plane dived down on the group about Moyon, and the Secret Agents could see the hand of the pilot, lifted high, as though he signaled.

The plane was a Mayther! The pilot was Carlos Kane!

Just as Kane went into action, and the noiseless bullets from his ship crashed into that twisted body, causing it to jump and twitch with the might of them, Prester Kleig gave the signal.

Even as the figure of Moyon crashed to the soil and the man's soul quitted its mortal casement, Kleig commanded:

"Spare all who surrender! Make them prisoners, to be used to repair the damage they have done to our country! Guards will be instantly placed over the amphibians and the aero-sub— for the day may come when we shall need to know their secrets!"

And, as men, hands lifted high in token of surrender, quitted the now motionless amphibians, and flyers

dropped down to make them prisoners, Maniel sighed, pressed various buttons on his apparatus, and the mad scene of carnage they had witnessed for hours faded slowly out, and darkness and silence filled the Secret Room.

But darkness is the joy of lovers, and in the midst of silence that was almost appalling by contrast, Kleig and Charmion were received into each other's arms.

#22 Vampires Of Venus, By Anthony Pelcher:

Leslie Larner, an Entomologist borrowed from the earth, pits himself against the night-flying vampires that are ravaging the inhabitants of Venus.

Aproximate word count: 7,000

Bigotry:

Warnings:

- - -

It was as if someone had thrown a bomb into a Quaker meeting, when adventure suddenly began to crowd itself into the life of the studious and methodical Leslie Larner, professor of entomology.

Fame had been his since early manhood, when he began to distinguish himself in several sciences, but the adventure and thrills he had longed for had always fallen to the lot of others.

His father, a college professor, had left him a good

working brain and nothing else. Later his mother died and he was left with no relatives in the world, so far as he knew. So he gave his life over to study and hard work.

Still youthful at twenty-five, he was hoping that fate would "give him a break." It did.

He was in charge of a Government department having to do with Oriental beetles, Hessian flies, boll weevils and such, and it seemed his life had been just one bug after another. He took creeping, crawling things seriously and believed that, unless curbed, insects would some day crowd man off the earth. He sounded an alarm, but humanity was not disturbed. So Leslie Larner fell back on his microscope and concerned himself with saving cotton, wheat and other crops. His only diversion was fishing for the elusive rainbow trout.

He managed to spend a month each year in the Colorado Rockies angling for speckled beauties.

Larner was anything but a clock-watcher, but on a

certain bright day in June he was seated in his laboratory doing just that.

"Just five minutes to go," he mused.

It was just 4:25 P. M. He had finished his work, put his affairs in order, and in five minutes would be free to leave on a much needed and well earned vacation. His bags were packed and at the station. His fishing tackle, the pride of his young life, was neatly rolled in oiled silk and stood near at hand.

"I'll just fill my calabash, take one more quiet smoke, and then for the mountains and freedom," he told himself. He settled back with his feet on his desk. He half closed his eyes in solid comfort. Then the bomb fell and exploded.

B-r-r-r-r!

The buzzer on his desk buzzed and his feet came off the desk and hit the floor with a thud. His eyes popped open and the calabash was immediately laid aside.

That buzzer usually meant business, and it would be his usual luck to have trouble crash in on him just as he was on the edge of a rainbow trout paradise.

A messenger was ushered into the room by an assistant. The boy handed him an envelope, said, "No answer," and departed.

Larner tore open the envelope lazily. He read and then re-read its contents, while a look of puzzled surprise disturbed his usually placid countenance. He spread the sheet of paper out on his desk, and for the tenth time he read:

Confidential.

Memorize this address and destroy this paper:

Tula Bela, 1726 88th Street, West, City of Hesper,
Republic of Pana, Planet Venus.

Will meet you in the Frying Pan.

That was all. It was enough. Larner lost his temper.

He crumpled the paper and tossed it in the waste basket. He was not given to profanity, but he could say "Judas Priest" in a way that sizzled.

"Judas Priest!" he spluttered. "Anyone who would send a man a crazy bunch of nonsense like that, at a time like this, ought to be snuffed out like a beetle!

"Meet you in the Frying Pan," he quoted. Then he happened to recall something. "By golly, there is a fishing district in Colorado known as the Frying Pan. That's not so crazy, but the planet Venus part surely is cuckoo."

He fished the paper out of the waste basket, found the envelope, placed the strange message within and put it in his inside coat pocket. Then he seized his suitcase and fishing tackle, and, rushing out, hailed a taxi. Not long after he was on his way west by plane.

As the country unrolled under him he retrieved the strange note from his pocket. He read it again and again. Then he examined the envelope. It was an ordinary one of good quality, designed for business

rather than social usage. The note paper appeared quite different. It was unruled, pure white, and of a texture which might be described as pebbly. It was strongly made, and of a nature unlike any paper Larner had ever seen before. It appeared to have been made from a fiber rather than a pulp.

"Wonder who wrote it?" Larner asked himself. "It is beautiful handwriting, masculine yet artistic. Wonder where he got the Frying Pan idea? At any rate, I'm not going to the Frying Pan this year—I'm camping on Tennessee Creek, in Lake County, Colorado. The country there is more beautiful and restful.

"But this street address on the planet Venus. Seems to me I read somewhere that Marconi had received mysterious signals that he believed came from the planet Venus. Hesper, Hesper ... it sounds familiar, somehow. Wonder if there could be anything to it?"

Something impelled him to follow out the instructions in the note. He spent the next few hours repeating the address over and over again. When he was satisfied that he had memorized it thoroughly, he tore the

strange paper into bits and sent it fluttering earthward like a tiny snowstorm.

Larner was not a gullible individual, but neither was he unimaginative. He was scientist enough to know that "the impossibilities of to-day are the accomplishments of to-morrow." So while not convinced that the note was a serious communication, still his mind was open.

The weird address insisted on creeping into his mind and driving out other thoughts, even those of his speckled playfellows, the rainbow trout.

"I've a notion to change my plans and go from Denver to the Frying Pan," he cogitated. Then he thought, "No, I won't take it that seriously."

Anyone who knows the Colorado Rockies knows paradise. There is no more beautiful country on the globe. Lake County, where Larner had chosen his fishing grounds, has as its seat the old mining camp of Leadville. It has been visited and settled more for its gold mines than the golden glow of its sunsets

above the clouds, but the gold of the sunsets is eternal, while the gold of the mines is fading quickly away.

Leadville, with its 5,000 inhabitants, nestles above the clouds, at an altitude of more than 10,000 feet. Mount Massive with its three peaks lies back of the town in panorama and rises to a height of some 14,400 feet. In the rugged mountains thereabouts are hundreds of lakes fed by wild streams and bubbling crystal springs. All these lakes are above the clouds.

Winter sees the whole picture decorated with bizarre snowdrifts from twenty to forty feet deep, but spring comes early. The beautiful columbines and crocuses bloom before the snow is all off the ground in the valleys. The lands up to 12,000 feet altitude are carpeted with a light green grass and moss. Giant pines and dainty aspens, with their silvery bark and pinkish leaves blossom forth and whisper, while the eternal snows still linger in the higher rocky cliffs and peaks above.

Indian-paint blooms its blood red in contrast to the

milder colorings. Blackbirds and bluebirds chatter and chipmunks chirp. The gold so hard to find in the mines glares from the skies. The hills cuddle in banks of snowy clouds, and above all a pure clear blue sky sweeps. The lakes and streams abound with rainbow trout, the gamest of any fresh water fish. It is indeed a paradise for either poet or sportsman.

In any direction near to Leadville a man can find Heaven and recreation and rest.

Finding himself on Harrison Avenue, the main street of the county seat, Larner, after renewing some old acquaintanceships, started west in a flivver for Tennessee Creek. The flivver is a modern adjustment. Until a few years ago the only means of traversing these same hills was by patient, sure-footed donkeys, which carried the pack while the wayfarer walked along beside.

The first day's fishing was good. Trout seemed to greet him cheerily and sprang eagerly to the fray. They bit at any sort of silken fly he cast.

The site chosen by Larner for his camp was in a mossy clearing separated from the stream by a fringe of willows along the creek. Then came a border of aspens backed by a forest of silver-tipped firs.

It was ideal and his eyes swept the scene with satisfaction. Then he began whittling bacon to grease his pan for frying trout over the open fire.

Suddenly he heard a rustle in the aspens, and, looking up, beheld a picture which made his eyes bulge. A man and a woman, garbed seemingly in the costumes of another world, walked toward him. Neither were more than five feet tall but were physically perfect, and marvelously pleasing to the eye. There was little difference in their dress.

Both wore helmets studded with what Larner believed to be sapphires. He learned later they were diamonds. Their clothing consisted of tight trouserlike garments surmounted by tunics of some white pelt resembling chamois save for color. A belt studded with precious stones encircled their waists. Artistic laced sandals graced their small firm feet.

Their skin was a pinkish white. Their every feature was perfection plus, and their bodies curved just enough wherever a curve should be. The woman was daintier and more fully developed, and her features were even more finely chiseled than the man. Otherwise it would have been difficult to distinguish their sex.

Larner took in these details subconsciously, for he was awed beyond expression. All he could do was to stand seemingly frozen, half bent over the campfire with his frying pan in his hand.

The man spoke.

"I hope we did not startle you," he said. "I thought my note would partly prepare you for this meeting. We expected to find you in the Frying Pan district. When you did not appear there we tuned our radio locator to your heart beats and in that way located you here. It was hardly a second's space-flying time from where we were."

Larner said nothing. He could only stand and gape.

"I do not wonder that you are surprised," said the strange little man. "I will explain that I am Nern Bela, of the City of Hesper, on the planet Venus. This is my sister Tula. We greet you in the interest of the Republic of Pana, which embraces all of the planet you know as Venus."

When Larner recovered his breath, he lost his temper.

"I don't know what circus you escaped from, but I crave solitude and I have no time to be bothered with fairy tales," he said with brutal brusqueness.

Expressions of hurt surprise swept the countenances of his visitors.

The man spoke again:

"We are just what we assert we are, and our finding you was made necessary by a condition which grieves the souls of all the 900,000,000 inhabitants of Venus. We have come to plead with you to come with us and use your scientific knowledge to thwart a scourge which threatens the lives of millions of people."

There was a quiet dignity about the man and an air of pride about the woman which made Larner stop and think, or try to. He rubbed his hand over his brow and looked questioningly at the pair.

"If you are what you say you are, how did you get here?" he asked.

"We came in a targo, a space-flying ship, capable of doing 426,000 miles an hour. This is just 1200 times as fast as 355 miles an hour, the highest speed known on earth. Come with us and we will show you our ship." They looked at him appealingly, and both smiled a smile of wistful friendliness.

Larner, without a word, threw down his frying pan and followed them through the aspens. The brother and sister walking ahead of him gave his eyes a treat. He surveyed the perfect form of the girl. Her perfection was beyond his ken.

"They certainly are not of this world," he mused.

A few hundred yards farther on there was a beach of

pebbles, where the stream had changed its course. On this plot sat a gigantic spherical machine of a glasslike material. It was about 300 feet in diameter and it was tapered on two sides into tees which Larner rightly took to be lights.

"This is a targo, our type of space-flyer," said Nern Bela. "It is capable of making two trips a year between Venus and the earth. We have visited this planet often, always landing in some mountain or jungle fastness as heretofore we did not desire earth-dwellers to know of our presence."

"Why not?" asked Larner, his mouth agape and his eyes protruding. His mind was so full of questions that he fairly blurted his first one.

"Because," said Bela, slowly and frankly, "because our race knows no sickness and we feared contagion, as your race has not yet learned to control its being."

"Oh," said Lamer thoughtfully. He realized that humans of the earth, whom he had always regarded as God's most perfect beings, were not so perfect

after all.

"How do you people control your being, as you express it?" he asked.

"It is simple," was the reply. "For ninety centuries we have ceased to breed imperfection, crime and disease. We deprived no one of the pleasures of life, but only the most perfect mental and physical specimens of our people cared to have children. In other words, while we make no claim to controlling our sex habits, we do control results."

"Oh," said Larner again.

Nern Bela led the way to a door which opened into the side of the space-flyer near its base. "We have a crew of four men and four women," he said. "They handle the entire ship, with my sister and I in command, making six souls aboard in all."

"Why men and women?" thought Larner.

As if in answer to his thought Bela said:

"On the earth the two sexes have struggled for sex supremacy. This has thrown your civilization out of balance. On Venus we have struggled for sex equality and have accomplished it. This is a perfect balance. Man and women engage in all endeavor and share all favors and rewards alike."

"In war, too?" asked Larner.

"There has not been war on Venus for 600,000 years," said Bela. "There is only the one nation, and the people all live in perfect accord. Our only trouble in centuries is a dire peril which now threatens our people, and it is of this that I wish to talk to you more at length."

They were standing close to the targo. Larner was struck by the peculiar material of which it was constructed. There was a question in his eyes, and Nern Bela answered it:

"The metal is duranium; it is metalized quartz. It is frictionless, conducts no current or ray except repulsion and attraction ray NTR69X6 by which it is

propelled. It is practically transparent, lighter than air and harder than a diamond. It is cast in moulds after being melted or, rather, fused.

"We use cold light which we produce by forcing oxygen through air tubes into a vat filled with the fat of a deep sea fish resembling your whale. You are aware, of course, that that is exactly how cold light is produced by the firefly, except for the fact that the firefly uses his own fat."

Larner was positively fascinated. He smoothed the metal of the targo in appreciation of its marvelous construction, but he longed most to see the curious light giving mechanism, for this was closer to his own line of entomology. He had always believed that the light giving organs of fireflies and deep-sea fishes could be reproduced mechanically.

The interior of the ship resembled in a vague way that of an ocean liner. It was controlled by an instrument board at which a man and a girl sat. They did not raise their heads as the three people entered.

When called by Bela and his sister, who seemed to give commands in unison, the crew assembled and were presented to the visitor.

"Earth-dwellers are not the curiosity to us that we seem to be to you," said Tula Bela, speaking for the first time and smiling sweetly.

Larner was too engrossed to note the remark further than to nod his head. He was lost in contemplation of these strange people, all garbed exactly alike and all surpassingly lovely to look upon.

An odor of food wafted from the galley, and Larner remembered he was hungry, with the hunger of health. He had swung his basket of fish over his shoulder when he left his campfire, and Tula took it from him.

"Would you like to have our chef prepare them for you?" she said, as she caught his hungry glance at his day's catch. This time Larner answered her.

"If you will pardon me," he said awkwardly. "Really I

am famished."

"You will not miss your fish dinner," said the girl.

"I believe there is enough for all of us," said Larner. "I caught twenty beauties. I never knew fish to bite like that. Why, they—" and he was off on a voluminous discourse on a favorite subject.

Those assembled listened sympathetically. Then Tula took the fish, and soon the aroma of broiling trout mingled with the other entrancing galley odors.

After a dinner at which some weird yet satisfying viands were served and much unusual conversation indulged in, Nern Bela led the way to what appeared to be the captain's quarters. The crew and their visitor sat down to discuss a subject which proved to be of such a terrifying nature as to scar human souls.

"People on Venus," said Nern, as his eyes took on a worried expression, "are unable to leave their homes after nightfall due to some strange nocturnal beast which attacks them and vampirishly drains all blood

from their veins, leaving the dead bodies limp and empty."

"What? How?" questioned Larner leaning far forward over the conference table.

The others nodded their heads, and in the eyes of the women there was terror. Larner could not but believe this.

"The beasts, or should I say insects, are as large as your horses and they fly, actually fly, by night, striking down humans, domestic animals and all creatures of warm blood. How many there are we have no means of knowing, and we cannot find their hiding and breeding places. They are not native to our planet, and where they come from we cannot imagine. They are actually monstrous flies, or bugs, or some form of insects."

Larner was overcome by incredulity and showed it. "Insects as big as horses?" he questioned and he could hardly suppress a smile.

"Believe us, in the name of the God of us all," insisted Nern. "They have a mouth which consists of a large suction disk, in the center of which is a lancelike tongue. The lance is forced into the body at any convenient point, and the suction disk drains out the blood. If we only knew their source! They attack young children and the aged, up to five hundred years, alike."

"What! Five hundred years?" exploded Larner again.

"I should have explained," said Nern, simply, "that Venus dwellers, due to our advanced knowledge of sanitation and health conversation, live about 800 years and then die invariably of old age. The only unnatural cause of death encountered is this giant insect. Accidents do occur, but they are rare. There are no deliberate killings on Venus."

Larner did not answer. He only pondered. The more he ran over the strange happenings of the last week in his mind the more he believed he was dreaming. His thoughts took a strange turn: "Why do these vain people go around dressed in jeweled ornaments?"

Nern again anticipated a question. "Diamonds, gold and many of what you call precious stones are common on Venus," he volunteered. "Talc and many other things are more valuable."

"Talc?"

"Yes, we use an immense quantity of it. We have a wood that is harder than your steel. We build machinery with it. We cannot use oil to lubricate these wooden shafts and bearings as it softens the wood, so all parts exposed to friction are sprayed constantly by a gust of talc from a blower.

"You use talc mostly for toilet purposes. We use it for various purposes. There is little left on Venus, and it is more valuable to us than either gold or diamonds. We draw on your planet now for talc. You dump immense quantities. We just shipped one hundred 1,000-ton globes of it from the Cripple Creek district, and the district never missed it. We drew most of it from your mine dumps."

Nern tried not to look bored as he explained more in

detail: "We brought 100 hollow spheres constructed of duranium. We suspended these over the Cripple Creek district at an altitude of 10,000 feet above the earth's surface. Because of the crystal glint of duranium they were invisible to earth dwellers at that height. Then we used a suction draft at night, drawing the talc from the earth, filling one drum after another. This is done by tuning in a certain selective attraction that attracts only talc. It draws it right out of your ground in tiny particles and assembles it in the transportation drums as pure talc. On the earth, if noticed at all, it would have been called a dust storm.

"The drums, when loaded with talc, are set to attract the proper planetary force and they go speeding toward Venus at the rate of 426,000 miles an hour. They are prevented from colliding with meteors by an automatic magnetic device. This is controlled by magnetic force alone, and when the targo gets too close to a meteor it changes its course instantly. The passenger targo we ride in acts similarly. And now may I return to the subject of the vampires of Venus?"

"Pardon my ignorance," said Larner, and for the first

time in his life he felt very ignorant indeed.

"I know little more than I have told you," said Nern, rather hopelessly. "Our knowledge of your world, your people and your language comes from our listening in on you and observing you without being observed or heard. This might seem like taking an advantage of you, were it not for the fact that we respect confidences, and subjugate all else to science. We have helped you at times, by telepathically suggesting ideas to your thinkers.

"We would have given you all our inventions in this way, gladly, but in many instances we were unable to find minds attuned to accept such advanced ideas. We have had the advantage of you because our planet is so many millions of years older than your own." There was a plaintive note in Nern's voice as he talked.

"But now we are on our knees to you, so to speak. We do not know everything and, desperately, we need the aid of a man of your caliber. In behalf of the distraught people of Venus, I am asking you bluntly to make a great sacrifice. Will you face the dangers of a

trip to Venus and use your knowledge to aid us in exterminating these creatures of hell?" There was positive pleading in his voice, and in the eyes of his beautiful sister there were tears.

"But what would my superiors in the Government Bureau think?" feebly protested Larner, "I could not explain...."

"You have no superiors in your line. Our Government needs you at this time more than any earthly government. Your place here is a fixture. You can always return to it, should you live. We are asking you to face a horrible death with us. You can name your own compensation, but I know you are not interested so much in reward.

"Now, honestly, my good professor, there is no advantage to be gained by explanation. Just disappear. In the name of God and in the interests of science and the salvation of a people who are at your mercy, just drop out of sight. Drop out of life on this planet. Come with us. The cause is worthy of the man I believe you to be."

"I will go," said Larner, and his hosts waited for no more. An instant later the targo shot out into interstellar space.

"How do you know what course to follow?" asked Larner after a reasonable time, when he had recovered from his surprise at the sudden take-off.

"We do not need to know. Our machine is tuned to be attracted by the planetary force of Venus alone. We could not go elsewhere. A repulsion ray finds us as we near Venus and protects us against too violent a landing. We will land on Venus like a feather about three months from to-night."

The time of the journey through outer space was of little moment save for one incident. Larner and the other travelers were suddenly and rather rudely jostled about the rapidly flying craft.

Larner lost his breath but not his speech. "What happened?" he inquired.

"We just automatically dodged a meteor," explained

Nern.

Most of the time of the trip was spent by Larner in listening to explanations of customs and traditions of the people of the brightest planet in the universe.

There was a question Larner had desired to ask Nern Bela, yet he hesitated to do so. Finally one evening during the journey to Venus, when the travelers had been occupying themselves in a scientific discussion of comparative evolution on the two planets, Larner saw his opportunity.

"Why," he asked rather hesitatingly, "did the people of Venus always remain so small? Why did you not strive more for height? The Japanese, who are the shortest in stature of earth people, always wanted to be tall."

"Without meaning any offense," replied Nern, "I must say that it is characteristic of earth dwellers to want something without knowing any good reason why they want it. It is perfectly all right for you people to be tall, but for us it is not so fitting. You see, Venus is smaller than the earth. Size is comparative. You think

we are not tall because you are used to taller people. Comparatively we are tall enough. In proportion to the size of our planet we are exactly the right size. We keep our population at 900,000,000, and that is the perfectly exact number of people who can live comfortably on our planet."

Arriving on Venus, Larner was assigned a laboratory and office in one of the Government buildings. It was a world seemingly made of glass. Quartz, of rose, white and crystal coloring, Larner found, was the commonest country rock of the planet. In many cases it was shot full of splinters of gold which the natives had not taken the trouble to recover. This quartz was of a terrific hardness and was used in building, paving, and public works generally. The effect was bewildering. It was a world of shimmering crystal.

The atmosphere of Venus had long puzzled Larner. While not an astronomer in the largest sense of the word, yet he had a keen interest in the heavens as a giant puzzle picture, and he had given some spare time to the study.

He knew that from all indications Venus had a most unusual atmosphere. He had read that the atmosphere was considerably denser than that of the earth, and that its presence made observation difficult. The actual surface of the planet he knew could hardly be seen due, either to this atmosphere, or seemingly perpetual cloud banks.

He had read that the presence of atmosphere surrounding Venus is indicated to earthly astronomers, during the planet's transit, by rings of light due to the reflection and scattering of collected sunlight by its atmosphere.

Astronomers on earth, he knew, had long been satisfied of the presence of great cloud banks, as rocks and soils could not have such high reflecting power. He knew that like the moon, Venus, when viewed from the earth, presents different phases from the crescent to the full or total stage.

Looking up at the sky from the quartz streets of Venus, Larner beheld, in sweeping grandeur, massed cloud banks, many of them apparently rain clouds.

Nern noted his skyward gaze, and said:

"We have accomplished meteorological control. Those clouds were brought under control when we conquered interplanetary force, and what you call gravity. We form them and move them at will. They are our rain factory. We make rain when and where we will. This insures our crops and makes for health and contentment.

"The air, you will note, is about the same or a little more moist than the earth air at sea level. This is due to the planet's position nearer the sun.

"We have been striving for centuries to make the air a little drier and more rare, but we have not succeeded yet. The heavy content of disintegrated quartz in our soil makes moisture very necessary for our crops, so our moist atmosphere is evidently a provision of providence. We are used to breathing this moist air, and when I first visited the earth I was made uncomfortable by your rarified atmosphere. Now I can adjust myself to breathing the air of either planet. However, I find myself drinking a great deal more

water on earth than on Venus."

In this fairyland which had enjoyed centuries of peace, health and accord, stark terror now reigned. In some instances the finely-bred, marvellously intelligent people were in a mental condition bordering on madness.

This was especially true in the farming districts, where whole herds of lats had been wiped out. Lats, Larner gleaned, were a common farm animal similar to the bovine species on earth, only more wooly. On these creatures the Venus dwellers depended for their milk and dairy supplies, and for their warmer clothing, which was made from the skin. The hair was used for brushes, in the building trades, and a thousand ways in manufacturing.

Besides the domestic animals hundreds of people continued to meet death, and only a few of the flying vampires had been hunted down. The giant insects were believed to breed slowly as compared to earth

insects, their females producing not more than ten eggs, by estimate, after which death overtook the adult. In spite of this they were reported to be increasing.

In the Government building Larner was placed in touch with all the Government scientists of Venus. His nearest collaborator was one Zorn Zada, most profound scientist of the planet. The two men, with a score of assistants, worked elbow to elbow on the most gigantic scientific mystery in the history of two planets.

A specimen of the dread invader was mounted and studied by the scientists, who were so engrossed in their work that they hardly took time to eat. As for sleep, there was little of it. Days were spent in research and nights in hunting the monsters. This hunting was done by newly recruited soldiers and scientists. The weapons used were a short ray-gun of high destructive power which disintegrated the bodies of the enemies by atomic energy blasts. The quarry was wary, however, and struck at isolated individuals rather than massed fighting lines.

Seated at his work-bench Larner asked Zorn Zada what had become of Nern Bela. In his heart he had a horrible lurking fear that the beautiful Tula Bela might fall before a swarm of the strange vampires, but he did not voice this anxiety.

"Nern and his sister are explorers and navigators," was the reply. "They have been assigned to carry you anywhere on this or any other planet where your work may engage you. They await your orders. They are too valuable as space-navigators to be placed in harm's way."

Breathing a sigh of relief, Larner bent to his labors.

"What other wild animals or harmful insects have you on this planet?" he asked Zorn.

"I get your thought," replied the first scientist of Venus. "You are seeking a natural enemy to this deadly flying menace, are you not?"

"Yes," admitted Larner.

"All insects left on Venus with this one exception are beneficial," said Zorn. "There are no wild animals, and no harmful insects. All animals, insects and birds have been domesticated and are fed by their keepers. We get fabrics from forms of what you call spiders and other web-builders and cocoon spinners. All forms of birds, beasts and crawling and flying things have been brought under the dominion of man. We will have to seek another way out than by finding an enemy parasite."

"Where do you think these insect invaders came from?" asked Larner.

"You have noticed they are unlike anything you have on earth in anatomical construction," said the savant. "They partake of the general features of Coleoptera (beetles), in that they wear a sheath of armor, yet their mouth parts are more on the order of the Diptera (flies). I regard them more as a fly than a beetle, because most Coleoptera are helpful to humanity while practically all, if not all, Diptera are malignant."

"As to their original habitat, I believe they migrated here from some other planet."

"They could not fly through space," said Larner.

"No, that is the mystery of it," agreed Zorn. "How they got here and where they breed are the questions that we have to answer."

Long days passed on Venus. Long days and sleepless nights. The big insects were hunted nightly by men armed with ray-guns, and nightly the blood-sucking monsters took their toll of humanity and animals.

Finally Larner and Zorn determined to capture one of the insects alive, muzzle its lance and suction pad, and give it sufficient freedom to find its way back to its hiding place. By following the shackled monster the scientists hoped to find the breeding grounds.

All the provinces of the planet joined in the drive. Men turned out in automatic vehicles, propelled by energy gathered from the atmosphere. They came on

foot and in aircraft. Mobilization was at given points and, leading the van, were Zorn and Larner and their confreres in the targo of Nern and Tula Bela. The great army of Venus carried giant searchlights and was armed with deadly ray-guns.

Headquarters of the vast Army of Offense was in the targo of the Belas. Larner was in supreme command. Just before the big army set out to scour the planet to seek the breeding place of the monsters Larner issued a bulletin that set all Venus by the ears.

Addressed to President Vole Vesta of the Republic of Pana and the good people of Venus, it read:

As is generally known, it has been the habit of the nation's space-flying merchantmen to visit the sunlit side of the planet Mercury to obtain certain rare woods and other materials not found on this planet.

One side of Mercury, as is known, is always turned from the sun and is in a condition of perpetual night. In this perpetual darkness and dampness, where many rivers flow into warm black swamps, the

vampires have bred for centuries. Conditions were ideal for their growth, and so through the ages they evolved into the monsters we have encountered lately on Venus.

During some comparatively recent visit to Mercury the grubs of these insects have found their way abroad a vegetation-laden targo left standing near the edge of the black swamps of Mercury. These grubs were thus transported to Venus and underwent their natural metamorphosis here. Reaching adult stage, they have found some place to hide and breed, and thus is explained the origin of the vampires of Venus.

This was widely read and discussed and was finally accepted as the means of the invasion of peaceful, beautiful Venus by a horror that might well have originated in hell.

However, this did not reveal the breeding grounds, or remove the nation-wide scourge of the horrible winged vampires, so the mobilization of all the forces of the planet continued.

As day followed day the hordes of fighting Venus dwellers grew in the concentration camps. In the targo of the Belas, Larner, brain-weary and body-racked as he was with overwork, found a grain of happiness in being in the presence of Nern and his beautiful, petite sister.

With Zorn, Larner was supervising the construction of a big net of strongly woven wire mesh, in which it was hoped to catch one of the vampires. It was decided to bait the trap with a fat female lat.

Zorn, Larner and the Belas fared forth from the concentration camp followed by a company of soldiers carrying the big net. Tula with her own hand led the fat lat heifer. His eyes were filled with commiseration for the poor animal.

Thousands of soldiers and citizenry, in fighting array, watched the departure of the little group.

In a glade the trap was set and the net arranged to fall over the monster once it attacked the calf. From a

thicket, in utter darkness, Zorn and Larner and the two Belas waited for the possible catch. The whole nation stood awaiting the order to advance.

On the fourth night the vigil was rewarded in a manner frightful to relate.

A clumsy flutter of giant wings broke the stillness.

The four waiting forms in the thicket rejoiced, believing the fat lat was about to be attacked.

Onward came the approaching horror. The measured flap, flap of its armored wings drawing nearer and nearer. Then, horror—horrors!

A feminine scream rent the air. Cries loud and shrill arose above a hysterical feminine cry for help.

The monster had chosen Tula Bela for its prey!

Zorn exploded an alarm bomb. A compressed air siren brought the army forward on the run. Giant floodlights began to light up the scene. The blood of

Larner and Nern froze.

The monster had borne the girl to the ground. Its frightful lance and cupper was upraised to strike. Larner was the nearest and the quickest to act. He grabbed for his ray-gun, swung at his belt. It was gone! In horror he remembered he had left it at the base. He seized a short knife and threw himself forward, rolling his body between that of the girl and the descending lance and cupper.

[Image description start. A black and white illustration showing a giant insect crouching over a woman on the ground, ready to suck out her blood.

The insect has its wings flared, with a round head and fat body tapering to a point. In the foreground, a man holding a short curved knife is running forward. Spotlights cut into the black sky in the background.
Image description end.]

As the lance pierced his shoulder Larner, in one wild gesture of frenzy, drove his knife through the soft, yielding flesh of the vampire's organ of suction.

Protected by no bony structure the snout of the monster was amputated.

The terrible creature had been disarmed of his most formidable weapon, but he continued to fight. Larner felt the spikes on the monster's legs tear at his flesh.

"Don't kill the thing," he shouted. "Bring on the net. For the love of God bring on the net!" Then he lost consciousness.

It was daylight when Larner, somewhat weakened from loss of blood, regained consciousness.

The beautiful Tula Bela was leaning over him.

She whispered comforting words to him in a language he did not fully understand. She whispered happy exclamations in words he did not know the meaning of, but the tone was unmistakably those of a sweetheart towards her lover.

Finally, in answer to a true scientist's question in his eyes, she said in English:

"They caught the thing alive. They await your order to advance."

"Let us be on our way," said Larner, and he started to arise.

"You are hardly strong enough," said Tula.

"Believe me, I am all right," insisted Larner, and after several trials he got to his feet. His constitution was naturally strong and his will was stronger, so he fought back all feelings of weakness and soon announced himself ready to go ahead with the project

at hand. For speed was all important, and the young professor found himself unable to remain inactive.

He rejoiced when Zorn told him that the big insect that had attacked Tula Bela had been captured alive and had been kept well nourished by lat's blood injected into its stomach.

With Zorn Larner went to inspect the hideous monstrosity and found it in leash and straining. It was ready to be used to lead the way back to its breeding place.

Its wings shackled, the lumbering insect floundered on its way straight north. Ponderously and half blindly it crawled as the searchlights' glare was kept far enough in advance to keep from blinding the monster.

True to instinct it finally brought up at early dawn under a high cliff of smoky quartz. Here, in the great crevices, the drove of diabolical vampires were hiding.

As the light struck their dens, they attempted clumsily to take wing, but a interlacing network of devastating disintegrating rays from the ray-guns shattered their bodies to dust, which was borne away by the wind.

The next few months were spent in combing the quartz crags of Venus for similar infested areas, but only the one breeding nest was found. The scourge had been conquered in its first and only stronghold.

So ended the greatest reign of terror in the history of Venus.

Leslie Larner was given a vote of thanks, and riches were showered upon him by the good people of the sky's brightest star.

His modesty was characteristic, and he insisted that his part in saving humanity on the planet had been small.

Passage back to earth was offered him, but Nern and Tula Bela urged him to stay and live his life on Venus. This he finally agreed to do.

"If I returned," he said, "I would always be tempted to tell my experiences while away, and there is not a jury in the world which would account me sane after I had once spoken."

That the story of Larner's adventure reached earth dwellers at all is due to the fact that Nern Bela on a subsequent visit to the earth narrated it to a Colorado quartz miner. This miner, a bronzed and bearded prospector for gold, stumbled on the targo in a mountain fastness, and there was nought to do but make him welcome and pledge him to secrecy.

The miner surveyed the crystal targo in rapt wonderment and said: "And to think I am the only earth man who ever viewed such a craft!"

"No," answered Nern Bela, "there is one other." And then the stirring story of Leslie Larner's life on Venus was told.

#23 The Soul Snatcher, By Tom Curry:

From twenty miles away stabbed the "Atom-filtering" rays to Allen Baker in his cell in the death house.

Aproximate word count: 6,000

Warnings:

- - -

The shrill voice of a woman stabbed the steady hum of the many machines in the great, semi-darkened laboratory. It was the onslaught of weak femininity against the ebony shadow of Jared, the silent negro servant of Professor Ramsey Burr. Not many people were able to get to the famous man against his wishes; Jared obeyed orders implicitly and was generally an efficient barrier.

"I will see him, I will," screamed the middle-aged woman. "I'm Mrs. Mary Baker, and he—he—it's his fault my son is going to die. His fault. *Professor!*

Professor Burr!"

Jared was unable to keep her quiet.

Coming in from the sunlight, her eyes were not yet accustomed to the strange, subdued haze of the laboratory, an immense chamber crammed full of equipment, the vista of which seemed like an apartment in hell. Bizarre shapes stood out from the mass of impedimenta, great stills which rose full two stories in height, dynamos, immense tubes of colored liquids, a hundred puzzles to the inexperienced eye.

The small, plump figure of Mrs. Baker was very out of place in this setting. Her voice was poignant, reedy. A look at her made it evident that she was a conventional, good woman. She had soft, cloudy golden eyes and a pathetic mouth, and she seemed on the point of tears.

"Madam, madam, de doctor is busy," whispered Jared, endeavoring to shoo her out of the laboratory with his polite hands. He was respectful, but firm.

She refused to obey. She stopped when she was within a few feet of the activity in the laboratory, and stared with fear and horror at the center of the room, and at its occupant, Professor Burr, whom she had addressed during her flurried entrance.

The professor's face, as he peered at her, seemed like a disembodied stare, for she could see only eyes behind a mask of lavender gray glass eyeholes, with its flapping ends of dirty, gray-white cloth.

She drew in a deep breath—and gasped, for the pungent fumes, acrid and penetrating, of sulphuric and nitric acids, stabbed her lungs. It was like the breath of hell, to fit the simile, and aptly Professor Burr seemed the devil himself, manipulating the infernal machines.

Acting swiftly, the tall figure stepped over and threw two switches in a single, sweeping movement. The vermillion light which had lived in a long row of tubes on a nearby bench abruptly ceased to writhe like so many tongues of flame, and the embers of hell died out.

Then the professor flooded the room in harsh gray-green light, and stopped the high-pitched, humming whine of his dynamos. A shadow picture writhing on the wall, projected from a lead-glass barrel, disappeared suddenly, the great color filters and other machines lost their semblance of horrible life, and a regretful sigh seemed to come from the metal creatures as they gave up the ghost.

To the woman, it had been entering the abode of fear. She could not restrain her shudders. But she bravely confronted the tall figure of Professor Burr, as he came forth to greet her.

He was extremely tall and attenuated, with a red, bony mask of a face pointed at the chin by a sharp little goatee. Feathery blond hair, silvered and awry, covered his great head.

"Madam," said Burr in a gentle, disarmingly quiet voice, "your manner of entrance might have cost you your life. Luckily I was able to deflect the rays from your person, else you might not now be able to voice your complaint—for such seems to be your purpose in

coming here." He turned to Jared, who was standing close by. "Very well, Jared. You may go. After this, it will be as well to throw the bolts, though in this case I am quite willing to see the visitor."

Jared slid away, leaving the plump little woman to confront the famous scientist.

For a moment, Mrs. Baker stared into the pale gray eyes, the pupils of which seemed black as coal by contrast. Some, his bitter enemies, claimed that Professor Ramsey Burr looked cold and bleak as an iceberg, others that he had a baleful glare. His mouth was grim and determined.

Yet, with her woman's eyes, Mrs. Baker, looking at the professor's bony mask of a face, with the high-bridged, intrepid nose, the passionless gray eyes, thought that Ramsey Burr would be handsome, if a little less cadaverous and more human.

"The experiment which you ruined by your untimely entrance," continued the professor, "was not a safe one."

His long white hand waved toward the bunched apparatus, but to her the room seemed all glittering metal coils of snakelike wire, ruddy copper, dull lead, and tubes of all shapes. Hell cauldrons of unknown chemicals seethed and slowly bubbled, beetle-black bakelite fixtures reflected the hideous light.

"Oh," she cried, clasping her hands as though she addressed him in prayer, "forget your science, Professor Burr, and be a man. Help me. Three days from now my boy, my son, whom I love above all the world, is to die."

"Three days is a long time," said Professor Burr calmly. "Do not lose hope: I have no intention of allowing your son, Allen Baker, to pay the price for a deed of mine. I freely confess it was I who was responsible for the death of—what was the person's name?—Smith, I believe."

"It was you who made Allen get poor Mr. Smith to agree to the experiments which killed him, and which the world blamed on my son," she said. "They called it

the deed of a scientific fiend, Professor Burr, and perhaps they are right. But Allen is innocent."

"Be quiet," ordered Burr, raising his hand.

"Remember, madam, your son Allen is only a commonplace medical man, and while I taught him a little from my vast store of knowledge, he was ignorant and of much less value to science and humanity than myself. Do you not understand, can you not comprehend, also, that the man Smith was a martyr to science? He was no loss to mankind, and only sentimentalists could have blamed anyone for his death. I should have succeeded in the interchange of atoms which we were working on, and Smith would at this moment be hailed as the first man to travel through space in invisible form, projected on radio waves, had it not been for the fact that the alloy which conducts the three types of sinusoidal failed me and burned out. Yes, it was an error in calculation, and Smith would now be called the Lindbergh of the Atom but for that. Yet Smith has not died in vain, for I have finally corrected this error—science is but trial and correction of error—and all will be well."

"But Allen—Allen must not die at all!" she cried. "For weeks he has been in the death house: it is killing me. The Governor refuses him a pardon, nor will he commute my son's sentence. In three days he is to die in the electric chair, for a crime which you admit you alone are responsible for. Yet you remain in your laboratory, immersed in your experiments, and do nothing, nothing!"

The tears came now, and she sobbed hysterically. It seemed that she was making an appeal to someone in whom she had only a forlorn hope.

"Nothing?" repeated Burr, pursing his thin lips.

"Nothing? Madam, I have done everything. I have, as I have told you, perfected the experiment. It is successful. Your son has not suffered in vain, and Smith's name will go down with the rest of science's martyrs as one who died for the sake of humanity. But if you wish to save your son, you must be calm. You must listen to what I have to say, and you must not fail to carry out my instructions to the letter. I am ready now."

Light, the light of hope, sprang in the mother's eyes. She grasped his arm and stared at him with shining face, through tear-dipped eyelashes.

"Do—do you mean it? Can you save him? After the Governor has refused me? What can you do? No influence will snatch Allen from the jaws of the law: the public is greatly excited and very hostile toward him."

A quiet smile played at the corners of Burr's thin lips.

"Come," he said. "Place this cloak about you. Allen wore it when he assisted me."

The professor replaced his own mask and conducted the woman into the interior of the laboratory.

"I will show you," said Professor Burr.

She saw before her now, on long metal shelves which appeared to be delicately poised on fine scales whose balance was registered by hair-line indicators, two small metal cages.

Professor Burr stepped over to a row of common cages set along the wall. There was a small menagerie there, guinea pigs—the martyrs of the animal kingdom—rabbits, monkeys, and some cats.

The man of science reached in and dragged out a mewling cat, placing it in the right-hand cage on the strange table. He then obtained a small monkey and put this animal in the left-hand cage, beside the cat. The cat, on the right, squatted on its haunches, mewling in pique and looking up at its tormentor. The monkey, after a quick look around, began to investigate the upper reaches of its new cage.

Over each of the animals was suspended a fine, curious metallic armament. For several minutes, while the woman, puzzled at how this demonstration was to affect the rescue of her condemned son, waited impatiently, the professor deftly worked at the apparatus, connecting wires here and there.

"I am ready now," said Burr. "Watch the two animals carefully."

"Yes, yes," she replied, faintly, for she was half afraid.

The great scientist was stooping over, looking at the balances of the indicators through microscopes.

She saw him reach for his switches, and then a brusque order caused her to turn her eyes back to the animals, the cat in the right-hand cage, the monkey at the left.

Both animals screamed in fear, and a sympathetic chorus sounded from the menagerie, as a long purple spark danced from one gray metal pole to the other, over the cages on the table.

At first, Mrs. Baker noticed no change. The spark had died, the professor's voice, unhurried, grave, broke the silence.

"The first part of the experiment is over," he said.

"The ego—"

"Oh, heavens!" cried the woman. "You've driven the poor creatures mad!"

She indicated the cat. That animal was clawing at the top bars of its cage, uttering a bizarre, chattering sound, somewhat like a monkey. The cat hung from the bars, swinging itself back and forth as on a trapeze, then reached up and hung by its hind claws.

As for the monkey, it was squatting on the floor of its cage, and it made a strange sound in its throat, almost a mew, and it hissed several times at the professor.

"They are not mad," said Burr. "As I was explaining to you, I have finished the first portion of the experiment. The ego, or personality of one animal has been taken out and put into the other."

She was unable to speak. He had mentioned madness: was he, Professor Ramsey Burr, crazy? It was likely enough. Yet—yet the whole thing, in these surroundings, seemed plausible. As she hesitated about speaking, watching with fascinated eyes the out-of-character behavior of the two beasts, Burr went on.

"The second part follows at once. Now that the two egos have interchanged, I will shift the bodies. When it is completed, the monkey will have taken the place of the cat, and vice versa. Watch."

He was busy for some time with his levers, and the smell of ozone reached Mrs. Baker's nostrils as she stared with horrified eyes at the animals.

She blinked. The sparks crackled madly, the monkey mewed, the cat chattered.

Were her eyes going back on her? She could see neither animal distinctly: they seemed to be shaking in some cosmic disturbance, and were but blurs. This illusion—for to her, it seemed it must be optical—persisted, grew worse, until the quaking forms of the two unfortunate creatures were like so much ectoplasm in swift motion, ghosts whirling about in a dark room.

Yet she could see the cages quite distinctly, and the table and even the indicators of the scales. She closed her eyes for a moment. The acrid odors penetrated to

her lungs, and she coughed, opening her eyes.

Now she could see clearly again. Yes, she could see a monkey, and it was climbing, quite naturally about its cage; it was excited, but a monkey. And the cat, while protesting mightily, acted like a cat.

Then she gasped. Had her mind, in the excitement, betrayed her? She looked at Professor Burr. On his lean face there was a smile of triumph, and he seemed to be awaiting her applause.

She looked again at the two cages. Surely, at first the cat had been in the right-hand cage, and the monkey in the left! And now, the monkey was in the place where the cat had been and the cat had been shifted to the left-hand cage.

"So it was with Smith, when the alloys burned out," said Burr. "It is impossible to extract the ego or dissolve the atoms and translate them into radio waves unless there is a connection with some other ego and body, for in such a case the translated soul and body would have no place to go. Luckily, for you,

madam, it was the man Smith who was killed when the alloys failed me. It might have been Allen, for he was the second pole of the connection."

"But," she began faintly, "how can this mad experiment have anything to do with saving my boy?"

He waved impatiently at her evident denseness. "Do you not understand? It is so I will save Allen, your son. I shall first switch our egos, or souls, as you say. Then switch the bodies. It must always take this sequence; why, I have not ascertained. But it always works thus."

Mrs. Baker was terrified. What she had just seen, smacked of the blackest magic—yet a woman in her position must grasp at straws. The world blamed her son for the murder of Smith, a man Professor Burr had made use of as he might a guinea pig, and Allen must be snatched from the death house.

"Do—do you mean you can bring Allen from the prison here—just by throwing those switches?" she asked.

"That is it. But there is more to it than that, for it is not magic, madam; it is science, you understand, and there must be some physical connection. But with your help, that can easily be made."

Professor Ramsey Burr, she knew, was the greatest electrical engineer the world had ever known. And he stood high as a physicist. Nothing hindered him in the pursuit of knowledge, they said. He knew no fear, and he lived on an intellectual promontory. He was so great that he almost lost sight of himself. To such a man, nothing was impossible. Hope, wild hope, sprang in Mary Baker's heart, and she grasped the bony hand of the professor and kissed it.

"Oh, I believe, I believe," she cried. "You can do it. You can save Allen. I will do anything, anything you tell me to."

"Very well. You visit your son daily at the death house, do you not?"

She nodded; a shiver of remembrance of that dread spot passed through her.

"Then you will tell him the plan and let him agree to see me the night preceding the electrocution. I will give him final instructions as to the exchange of bodies. When my life spirit, or ego, is confined in your son's body in the death house, Allen will be able to perform the feat of changing the bodies, and your son's flesh will join his soul, which will have been temporarily inhabiting my own shell. Do you see? When they find me in the cell where they suppose your son to be, they will be unable to explain the phenomenon; they can do nothing but release me. Your son will go here, and can be whisked away to a safe place of concealment."

"Yes, yes. What am I to do besides this?"

Professor Burr pulled out a drawer near at hand, and from it extracted a folded garment of thin, shiny material.

"This is metal cloth coated with the new alloy," he said, in a matter of fact tone. He rummaged further, saying as he did so, "I expected you would be here to see me, and I have been getting ready for your visit."

All is prepared, save a few odds and ends which I can easily clean up in the next two days. Here are four cups which Allen must place under each leg of his bed, and this delicate little director coil you must take especial pains with. It is to be slipped under your son's tongue at the time appointed."

She was staring at him still, half in fear, half in wonder, yet she could not feel any doubt of the man's miraculous powers. Somehow, while he talked to her and rested those cold eyes upon her, she was under the spell of the great scientist. Her son, before the trouble into which he had been dragged by the professor, had often hinted at the abilities of Ramsey Burr, given her the idea that his employer was practically a necromancer, yet a magician whose advanced scientific knowledge was correct and explainable in the light of reason.

Yes, Allen had talked to her often when he was at home, resting from his labors with Professor Burr. He had spoken of the new electricity discovered by the famous man, and also told his mother that Burr had found a method of separating atoms and then

transforming them into a form of radio-electricity so that they could be sent in radio waves, to designated points. And she now remembered—the swift trial and conviction of Allen on the charge of murder had occupied her so deeply that she had forgotten all else for the time being—that her son had informed her quite seriously that Professor Ramsey Burr would soon be able to transport human beings by radio.

"Neither of us will be injured in any way by the change," said Burr calmly. "It is possible for me now to break up human flesh, send the atoms by radio-electricity, and reassemble them in their proper form by these special transformers and atom filters."

Mrs. Baker took all the apparatus presented her by the professor. She ventured the thought that it might be better to perform the experiment at once, instead of waiting until the last minute, but this Professor Burr waved aside as impossible. He needed the extra time, he said, and there was no hurry.

She glanced about the room, and her eye took in the giant switches of copper with their black handles;

there were others of a gray-green metal she did not recognize. Many dials and meters, strange to her, confronted the little woman. These things, she felt with a rush of gratitude toward the inanimate objects, would help to save her son, so they interested her and she began to feel kindly toward the great machines.

Would Professor Burr be able to save Allen as he claimed? Yes, she thought, he could. She would make Allen consent to the trial of it, even though her son had cursed the scientist and cried he would never speak to Ramsey Burr again.

She was escorted from the home of the professor by Jared, and going out into the bright, sunlit street, blinked as her eyes adjusted themselves to the daylight after the queer light of the laboratory. In a bundle she had a strange suit and the cups; her purse held the tiny coil, wrapped in cotton.

How could she get the authorities to consent to her son having the suit? The cups and the coil she might slip to him herself. She decided that a mother would be allowed to give her son new underwear. Yes, she

would say it was that.

She started at once for the prison. Professor Burr's laboratory was but twenty miles from the cell where her son was incarcerated.

As she rode on the train, seeing people in everyday attire, commonplace occurrences going on about her, the spell of Professor Burr faded, and cold reason stared her in the face. Was it nonsense, this idea of transporting bodies through the air, in invisible waves? Yet, she was old-fashioned; the age of miracles had not passed for her. Radio, in which pictures and voices could be sent on wireless waves, was unexplainable to her. Perhaps—

She sighed, and shook her head. It was hard to believe. It was also hard to believe that her son was in deadly peril, condemned to death as a "scientific fiend."

Here was her station. A taxi took her to the prison, and after a talk with the warden, finally she stood there, before the screen through which she could talk

to Allen, her son.

"Mother!"

Her heart lifted, melted within her. It was always thus when he spoke. "Allen," she whispered softly.

They were allowed to talk undisturbed.

"Professor Burr wishes to help you," she said, in a low voice.

Her son, Allen Baker, M. D., turned eyes of misery upon her. His ruddy hair was awry. This young man was imaginative and could therefore suffer deeply. He had the gift of turning platitudes into puzzles, and his hazel eyes were lit with an elfin quality, which, if possible, endeared him the more to his mother. All his life he had been the greatest thing in the world to this woman. To see him in such straits tore her very heart. When he had been a little boy, she had been able to make joy appear in those eyes by a word and a pat; now that he was a man, the matter was more difficult, but she had always done her best.

"I cannot allow Professor Burr to do anything for me," he said dully. "It is his fault that I am here."

"But Allen, you must listen, listen carefully. Professor Burr can save you. He says it was all a mistake, the alloy was wrong. He has not come forward before, because he knew he would be able to iron out the trouble if he had time, and thus snatch you from this terrible place."

She put as much confidence into her voice as she could. She must, to enhearten her son. Anything to replace that look of suffering with one of hope. She would believe, she did believe. The bars, the great masses of stone which enclosed her son would be as nothing. He would pass through them, unseen, unheard.

For a time, Allen spoke bitterly of Ramsey Burr, but his mother pleaded with him, telling him it was his only chance, and that the deviltry Allen suspected was imaginary.

"He—he killed Smith in such an experiment," said

Allen. "I took the blame, as you know, though I only followed his instructions. But you say he claims to have found the correct alloys?"

"Yes. And this suit, you must put it on. But Professor Burr himself will be here to see you day after tomorrow, the day preceding the—the—" She bit her lip, and got out the dreaded word, "the electrocution. But there won't be any electrocution, Allen; no, there cannot be. You will be safe, safe in my arms." She had to fight now to hold her belief in the miracle which Burr had promised. The solid steel and stone dismayed her brain.

The new alloy seemed to interest Allen Baker. His mother told him of the exchange of the monkey and the cat, and he nodded excitedly, growing more and more restive, and his eyes began to shine with hope and curiosity.

"I have told the warden about the suit, saying it was something I made for you myself," she said, in a low voice. "You must pretend the coil and the cups are things you desire for your own amusement. You know,

they have allowed you a great deal of latitude, since you are educated and need diversion."

"Yes, yes. There may be some difficulty, but I will overcome that. Tell Burr to come. I'll talk with him and he can instruct me in the final details. It is better than waiting here like a rat in a trap. I have been afraid of going mad, mother, but this buoys me up."

He smiled at her, and her heart sang in the joy of relief.

How did the intervening days pass? Mrs. Baker could not sleep, could scarcely eat, she could do nothing but wait, wait, wait. She watched the meeting of her son and Ramsey Burr, on the day preceding the date set for the execution.

"Well, Baker," said Burr nonchalantly, nodding to his former assistant. "How are you?"

"You see how I am," said Allen, coldly.

"Yes, yes. Well, listen to what I have to say and note it

carefully. There must be no slip. You have the suit, the cups and the director coil? You must keep the suit on, the cups go under the legs of the cot you lie on. The director under your tongue."

The professor spoke further with Allen, instructing him in scientific terms which the woman scarcely comprehended.

"To-night, then at eleven-thirty," said Burr, finally. "Be ready."

Allen nodded. Mrs. Baker accompanied Burr from the prison.

"You—you will let me be with you?" she begged.

"It is hardly necessary," said the professor.

"But I must. I must see Allen the moment he is free, to make sure he is all right. Then, I want to be able to take him away. I have a place in which we can hide, and as soon as he is rescued he must be taken out of sight."

"Very well," said Burr, shrugging. "It is immaterial to me, so long as you do not interfere with the course of the experiment. You must sit perfectly still, you must not speak until Allen stands before you and addresses you."

"Yes, I will obey you," she promised.

Mrs. Baker watched Professor Ramsey Burr eat his supper. Burr himself was not in the least perturbed; it was wonderful, she thought, that he could be so calm. To her, it was the great moment, the moment when her son would be saved from the jaws of death.

Jared carried a comfortable chair into the laboratory and she sat in it, quiet as a mouse, in one corner of the room.

It was nine o'clock, and Professor Burr was busy with his preparations. She knew he had been working steadily for the past few days. She gripped the arms of her chair, and her heart burned within her.

The professor was making sure of his apparatus. He

tested this bulb and that, and carefully inspected the curious oscillating platform, over which was suspended a thickly bunched group of gray-green wire, which was seemingly an antenna. The numerous indicators and implements seemed to be satisfactory, for at quarter after eleven Burr gave an exclamation of pleasure and nodded to himself.

Burr seemed to have forgotten the woman. He spoke aloud occasionally, but not to her, as he drew forth a suit made of the same metal cloth as Allen must have on at this moment.

The tension was terrific, terrific for the mother, who was awaiting the culmination of the experiment which would rescue her son from the electric chair—or would it fail? She shuddered. What if Burr were mad?

But look at him, she was sure he was sane, as sane as she was.

"He will succeed," she murmured, digging her nails into the palms of her hands. "I *know* he will."

She pushed aside the picture of what would happen on the morrow, but a few hours distant, when Allen, her son, was due to be led to a legal death in the electric chair.

Professor Burr placed the shiny suit upon his lank form, and she saw him put a duplicate coil, the same sort of small machine which Allen possessed, under his tongue.

The Mephistophelian figure consulted a matter-of-fact watch; at that moment, Mrs. Baker heard, above the hum of the myriad machines in the laboratory, the slow chiming of a clock. It was the moment set for the deed.

Then, she feared the professor was insane, for he suddenly leaped to the high bench of the table on which stood one of the oscillating platforms.

Wires led out from this, and Burr sat gently upon it, a strange figure in the subdued light.

Professor Burr, however, she soon saw, was not

insane. No, this was part of it. He was reaching for switches near at hand, and bulbs began to glow with unpleasant light, needles on indicators swung madly, and at last, Professor Burr kicked over a giant switch, which seemed to be the final movement.

For several seconds the professor did not move. Then his body grew rigid, and he twisted a few times. His face, though not drawn in pain, yet twitched galvanically, as though actuated by slight jabs of electricity.

The many tubes fluoresced, flared up in pulsing waves of violet and pink: there were gray bars of invisibility or areas of air in which nothing visible showed. There came the faint, crackling hum of machinery rather like a swarm of wasps in anger. Blue and gray thread of fire spat across the antenna. The odor of ozone came to Mrs. Baker's nostrils, and the acid odors burned her lungs.

She was staring at him, staring at the professor's face. She half rose from her chair, and uttered a little cry.

The eyes had changed, no longer were they cold, impersonal, the eyes of a man who prided himself on the fact that he kept his arteries soft and his heart hard; they were loving, soft eyes.

"Allen," she cried.

Yes, without doubt, the eyes of her son were looking at her out of the body of Professor Ramsey Burr.

"Mother," he said gently. "Don't be alarmed. It is successful. I am here, in Professor Burr's body."

"Yes," she cried, hysterically. It was too weird to believe. It seemed dim to her, unearthly.

"Are you all right, darling?" she asked timidly.

"Yes. I felt nothing beyond a momentary giddy spell, a bit of nausea and mental stiffness. It was strange, and I have a slight headache. However, all is well."

He grinned at her, laughed with the voice which was not his, yet which she recognized as directed by her

son's spirit. The laugh was cracked and unlike Allen's whole-hearted mirth, yet she smiled in sympathy.

"Yes, the first part is a success," said the man. "Our egos have interchanged. Soon, our bodies will undergo the transformation, and then I must keep under cover. I dislike Burr—yet he is a great man. He has saved me. I suppose the slight headache which I feel is one bequeathed me by Burr. I hope he inherits my shivers and terrors and the neuralgia for the time being, so he will get some idea of what I have undergone."

He had got down from the oscillating platform, the spirit of her son in Ramsey's body.

"What—what are you doing now?" she asked.

"I must carry out the rest of it myself," he said. "Burr directed me when we talked yesterday. It is more difficult when one subject is out of the laboratory, and the tubes must be checked."

He went carefully about his work, and she saw him

replacing four of the tubes with others, new ones, which were ready at hand. Though it was the body of Ramsey Burr, the movements were different from the slow, precise work of the professor, and more and more, she realized that her son inhabited the shell before her.

For a moment, the mother thought of attempting to dissuade her son from making the final change; was it not better thus, than to chance the disintegration of the bodies? Suppose something went wrong, and the exchange did not take place, and her son, that is, his spirit, went back to the death house?

Midnight struck as he worked feverishly at the apparatus, the long face corrugated as he checked the dials and tubes. He worked swiftly, but evidently was following a procedure which he had committed to memory, for he was forced to pause often to make sure of himself.

"Everything is O. K.," said the strange voice at last. He consulted his watch. "Twelve-thirty," he said.

She bit her lip in terror, as he cried, "Now!" and sprang to the table to take his place on the metallic platform, which oscillated to and fro under his weight. The delicate grayish metal antenna, which, she knew, would form a glittering halo of blue and gray threads of fire, rested quiescent above his head.

"This is the last thing," he said calmly, as he reached for the big ebony handled switch. "I'll be myself in a few minutes, mother."

"Yes, son, yes."

The switch connected, and Allen Baker, in the form of Ramsey Burr, suddenly cried out in pain. His mother leaped up to run to his side, but he waved her away. She stood, wringing her hands, as he began to twist and turn, as though torn by some invisible force. Every scream came from the throat of the man on the platform, and Mrs. Baker's cries of sympathy mingled with them.

[Image description start. A black and white illustration of a man standing on a platform in a laboratory, his mouth open as though crying out in pain, and his hands drawn to his chest, while a woman in front of the platform looks on in horror.

Image description end.]

The mighty motors hummed in a high-pitched, unnatural whine, and suddenly Mrs. Baker saw the tortured face before her grow dim. The countenance of the professor seemed to melt, and then there came a dull, muffled thud, a burst of white-blue flame, the odor of burning rubber and the tinkle of broken glass.

Back to the face came the clarity of outline, and still it was Professor Ramsey Burr's body she stared at.

Her son, in the professor's shape, climbed from the platform, and looked about him as though dazed. An acrid smoke filled the room, and burning insulation assailed the nostrils.

Desperately, without looking at her, his lips set in a determined line, the man went hurriedly over the apparatus again.

"Have I forgotten, did I do anything wrong?" she heard his anguished cry.

Two tubes were burned out, and these he replaced as swiftly as possible. But he was forced to go all over

the wiring, and cut out whatever had been short-circuited so that it could be hooked up anew with uninjured wire.

Before he was ready to resume his seat on the platform, after half an hour of feverish haste, a knock came on the door.

The person outside was imperative, and Mrs. Baker ran over and opened the portal. Jared, the whites of his eyes shining in the dim light, stood there. "De professah—tell him dat de wahden wishes to talk with him. It is very important, ma'am."

The body of Burr, inhabited by Allen's soul, pushed by her, and she followed falteringly, wringing her hands. She saw the tall figure snatch at the receiver and listen.

"Oh, God," he cried.

At last, he put the receiver back on the hook, automatically, and sank down in a chair, his face in his hands.

Mrs. Baker went to him quickly. "What is it, Allen?" she cried.

"Mother," he said hoarsely, "it was the warden of the prison. He told me that Allen Baker had gone temporarily insane, and claimed to be Professor Ramsey Burr in my body."

"But—but what is the matter?" she asked. "Cannot you finish the experiment, Allen? Can't you change the two bodies now?"

He shook his head. "Mother—they electrocuted Ramsey Burr in my body at twelve forty-five to-night!"

She screamed. She was faint, but she controlled herself with a great effort.

"But the electrocution was not to be until morning," she said.

Allen shook his head. "They are allowed a certain latitude, about twelve hours," he said. "Burr protested up to the last moment, and begged for time."

"Then—then they must have come for him and dragged him forth to die in the electric chair while you were attempting the second part of the change," she said.

"Yes. That was why it failed. That's why the tubes and wires burned out and why we couldn't exchange bodies. It began to succeed, then I could feel something terrible had happened. It was impossible to complete the Beta circuit, which short-circuited. They took him from the cell, do you see, while I was starting the exchange of the atoms."

For a time, the mother and her boy sat staring at one another. She saw the tall, eccentric figure of Ramsey Burr before her, yet she saw also the soul of her son within that form. The eyes were Allen's, the voice was soft and loving, and his spirit was with her.

"Come, Allen, my son," she said softly.

"Burr paid the price," said Allen, shaking his head.
"He became a martyr to science."

The world has wondered why Professor Ramsey Burr, so much in the headlines as a great scientist, suddenly gave up all his experiments and took up the practice of medicine.

Now that the public furor and indignation over the death of the man Smith has died down, sentimentalists believe that Ramsey Burr has reformed and changed his icy nature, for he manifests great affection and care for Mrs. Mary Baker, the mother of the electrocuted man who had been his assistant.

#24 The Ray Of Madness By Sterner St. Paul Meek:

Dr. Bird Uncovers a dastardly plot, amazing in its mechanical ingenuity, behind the apparently trivial eye trouble of the president.

- - -

A knock sounded at the door of Dr. Bird's private laboratory in the Bureau of Standards. The famous scientist paid no attention to the interruption but bent his head lower over the spectroscope with which he was working. The knock was repeated with a quality of quiet insistence upon recognition. The Doctor smothered an exclamation of impatience and strode over to the door and threw it open to the knocker.

"Oh, hello, Carnes," he exclaimed as he recognized

his visitor. "Come in and sit down and keep your mouth shut for a few minutes. I am busy just now but I'll be at liberty in a little while."

"There's no hurry, Doctor," replied Operative Carnes of the United States Secret Service as he entered the room and sat on the edge of the Doctor's desk. "I haven't got a case up my sleeve this time; I just came in for a little chat."

"All right, glad to see you. Read that latest volume of the *Zeitschrift* for a while. That article of Von Beyer's has got me guessing, all right."

Carnes picked up the indicated volume and settled himself to read. The Doctor bent over his apparatus. Time and again he made minute adjustments and gave vent to muttered exclamations of annoyance at the results he obtained. Half an hour later he rose from his chair with a sigh and turned to his visitor.

"What do you think of Von Beyer's alleged discovery?" he asked the operative.

"It's too deep for me, Doctor," replied the operative.

"All that I can make out of it is that he claims to have discovered a new element named 'lunium,' but hasn't been able to isolate it yet. Is there anything remarkable about that? It seems to me that I have read of other new elements being discovered from time to time."

"There is nothing remarkable about the discovery of a new element by the spectroscopic method," replied Dr. Bird. "We know from Mendeleff's table that there are a number of elements which we have not discovered as yet, and several of the ones we know were first detected by the spectroscope. The thing which puzzles me is that so brilliant a man as Von Beyer claims to have discovered it in the spectra of the moon. His name, lunium, is taken from Luna, the moon."

"Why not the moon? Haven't several elements been first discovered in the spectra of stars?"

"Certainly. The classic example is Lockyer's discovery of an orange line in the spectra of the sun in 1868. No

known terrestrial element gave such a line and he named the new element which he deduced helium, from Helos, the sun. The element helium was first isolated by Ramsey some twenty-seven years later. Other elements have been found in the spectra of stars, but the point I am making is that the sun and the stars are incandescent bodies and could be logically expected to show the characteristic lines of their constituent elements in their spectra. But the moon is a cold body without an atmosphere and is visible only by reflected light. The element, lunium, may exist in the moon, but the manifestations which Von Beyer has observed must be, not from the moon, but from the source of the reflected light which he spectro-analyzed."

"You are over my depth, Doctor."

"I'm over my own. I have tried to follow Von Beyer's reasoning and I have tried to check his findings. Twice this evening I thought that I caught a momentary glimpse on the screen of my fluoroscope of the ultra-violet line which he reports as characteristic of lunium, but I am not certain. I

haven't been able to photograph it yet. He notes in his article that the line seems to be quite impermanent and fades so rapidly that an accurate measurement of its wave-length is almost impossible. However, let's drop the subject. How do you like your new assignment?"

"Oh, it's all right. I would rather be back on my old work."

"I haven't seen you since you were assigned to the Presidential detail. I suppose that you fellows are pretty busy getting ready for Premier McDougal's visit?"

"I doubt if he will come," replied Carnes soberly.
"Things are not exactly propitious for a visit of that sort just now."

Dr. Bird sat back in his chair in surprise.

"I thought that the whole thing is arranged. The press seems to think so, at any rate."

"Everything is arranged, but arrangements may be cancelled. I wouldn't be surprised to hear that they were."

"Carnes," replied Dr. Bird gravely, "you have either said too much or too little. There is something more to this than appears on the surface. If it is none of my business, don't hesitate to tell me so and I'll forget what you have said, but if I can help you any, speak up."

Carnes puffed meditatively at his pipe for a few minutes before replying.

"It's really none of your business. Doctor," he said at length, "and yet I know that a corpse is a chatterbox compared to you when you are told anything in confidence, and I really need to unload my mind. It has been kept from the press so far; but I don't know how long it can be kept muzzled. In strict confidence, the President of the United State acts as though he were crazy."

"Quite a section of the press has claimed that for a

long time," replied Dr. Bird, with a twinkle in his eye.

"I don't mean crazy in that way, Doctor, I mean *really* crazy. Bugs! Nuts! Bats in his belfry!"

Dr. Bird whistled softly.

"Are you sure, Carnes?" he asked.

"As sure as may be. Both of his physicians think so. They were non-committal for a while, especially as the first attack waned and he seemed to recover, but when his second attack came on more violently than the first and the President began to act queerly, they had to take the Presidential detail into their confidence. He has been quietly examined by some of the greatest psychiatrists in the country, but none of them have ventured on a positive verdict as to the nature of the malady. They admit, of course, that it exists, but they won't classify it. The fact that it is intermittent seems to have them stopped. He was bad a month ago but he recovered and became, to all appearances, normal for a time. About a week ago he began to show queer symptoms again and now he is

getting worse daily. If he goes on getting worse for another week, it will have to be announced so that the Vice-President can take over the duties of the head of the government."

"What are the symptoms?"

"The first we noticed was a failing of his memory. Coupled with this was a restlessness and a habit of nocturnal prowling. He tosses continually on his bed and mutters and at times leaps up and rages back and forth in his bedchamber, howling and raging. Then he will calm down and compose himself and go to sleep, only to wake in half an hour and go through the same performance. It is pretty ghastly for the men on night guard."

"How does he act in the daytime?"

"Heavy and lethargic. His memory becomes a complete blank at times and he talks wildly. Those are the times we must guard against."

"Overwork?" queried the Doctor.

"Not according to his physicians. His physical health is splendid and his appetite unusually keen. He takes his exercise regularly and suffers no ill health except for a little eye trouble."

Dr. Bird leaped to his feet.

"Tell me more about this eye trouble, Carnes," he demanded.

"Why, I don't know much about it, Doctor. Admiral Clay told me that it was nothing but a mild opthalmia which should yield readily to treatment. That was when he told me to see that the shades of the President's study were partially drawn to keep the direct sunlight out."

"Ophthalmia be sugared! What do his eyes look like?"

"They are rather red and swollen and a little bloodshot. He has a tendency to shut them while he is talking and he avoids light as much as possible. I hadn't noticed anything peculiar about it."

"Carnes, did you ever see a case of snow blindness?"

The operative looked up in surprise.

"Yes, I have. I had it myself once in Maine. Now that you mention it, his case does look like snow blindness, but such a thing is absurd in Washington in August."

Dr. Bird rummaged in his desk and drew out a book, which he consulted for a moment.

"Now, Carnes," he said, "I want some dates from you and I want them accurately. Don't guess, for a great deal may depend on the accuracy of your answers. When was this mental disability on the part of the President first noticed?"

Carnes drew a pocket diary from his coat and consulted it.

"The seventeenth of July," he replied. "That is, we are sure, in view of later developments, that that was the date it first came on. We didn't realize that anything was wrong until the twentieth. On the night of the

nineteenth the President slept very poorly, getting up and creating a disturbance twice, and on the twentieth he acted so queerly that it was necessary to cancel three conferences."

Dr. Bird checked off the dates on the book before him and nodded.

"Go on," he said, "and describe the progress of the malady by days."

"It got progressively worse until the night of the twenty-third. The twenty-fourth he was no worse, and on the twenty-fifth a slight improvement was noticed. He got steadily better until, by the third or fourth of August, he was apparently normal. About the twelfth he began to show signs of restlessness which have increased daily during the past week. Last night, the nineteenth, he slept only a few minutes and Brady, who was on guard, says that his howls were terrible. His memory has been almost a total blank today and all of his appointments were cancelled, ostensibly because of his eye trouble. If he gets any worse, it probably will be necessary to inform the country as to

his true condition."

When Carnes had finished, Dr. Bird sat for a time in concentrated thought.

"You did exactly right in coming to me, Carnes," he said presently. "I don't think that this is a job for a doctor at all—I believe that it needs a physicist and a chemist and possibly a detective to cure him. We'll get busy."

"What do you mean, Doctor?" demanded Carnes. "Do you think that some exterior force is causing the President's disability?"

"I think nothing, Carnes," replied the Doctor grimly, "but I intend to know something before I am through. Don't ask for explanations: this is not the time for talk, it is the time for action. Can you get me into the White House to-night?"

"I doubt it, Doctor, but I'll try. What excuse shall I give? I am not supposed to have told you anything about the President's illness."

"Get Bolton, your chief, on the phone and tell him that you have talked to me when you shouldn't have. He'll blow up, but after he is through exploding, tell him that I smell a rat and that I want him down here at once with *carte blanche* authority to do as I see fit in the White House. If he makes any fuss about it, remind him of the fact that he has considered me crazy several times in the past when events showed that I was right. If he won't play after that, let me talk to him."

"All right, Doctor," replied Carnes as he picked up the scientist's telephone and gave the number of the home of the Chief of the Secret Service. "I'll try to bully him out of it. He has a good deal of confidence in your ability."

Half an hour later the door of Dr. Bird's laboratory opened suddenly to admit Bolton.

"Hello, Doctor," exclaimed the Chief, "what the dickens have you got on your mind now? I ought to skin Carnes alive for talking out of turn, but if you really have an idea, I'll forgive him. What do you

suspect?"

"I suspect several things, Bolton, but I haven't time to tell you what they are. I want to get quietly into the White House as promptly as possible."

"That's easy," replied Bolton, "but first I want to know what the object of the visit is."

"The object is to see what I can find out. My ideas are entirely too nebulous to attempt to lay them out before you just now. You've never worked directly with me on a case before, but Carnes can tell you that I have my own methods of working and that I won't spill my ideas until I have something more definite to go on than I have at present."

"The Doctor is right, Chief," said Carnes. "He has an idea all right, but wild horses won't drag it out of him until he's ready to talk. You'll have to take him on faith, as I always do."

Bolton hesitated a moment and then shrugged his shoulders.

"Have it your own way, Doctor," he said. "Your reputation, both as a scientist and as an unraveller of tangled skeins, is too good for me to boggle about your methods. Tell me what you want and I'll try to get it."

"I want to get into the White House without undue prominence being given to my movements, and listen outside the President's door for a short time. Later I will want to examine his sleeping quarters carefully and to make a few tests. I may be entirely wrong in my assumptions, but I believe that there is something there that requires my attention."

"Come along," said Bolton. "I'll get you in and let you listen, but the rest we'll have to trust to luck on. You may have to wait until morning."

"We'll cross that bridge when we get to it," replied the Doctor. "I'll get a little stuff together that we may need."

In a few moments he had packed some apparatus in a bag and, taking up it and an instrument case, he

followed Bolton and Carnes down the stairs and out onto the grounds of the Bureau of Standards.

"It's a beautiful moon, isn't it?" he observed.

Carnes assented absently to the Doctor's remark, but Bolton paid no attention to the luminous disc overhead, which was flooding the landscape with its mellow light.

"My car is waiting," he announced.

"All right, old man, but stop for a moment and admire this moon," protested the Doctor. "Have you ever seen a finer one?"

"Come on and let the moon alone," snorted Bolton.

"My dear man, I absolutely refuse to move a step until you pause in your headlong devotion to duty and pay the homage due to Lady Luna. Don't you realize, you benighted Christian, that you are gazing upon what has been held to be a deity, or at least the visible manifestation of deity, for ages immemorial? Haven't

you ever had time to study the history of the moon-worshipping cults? They are as old as mankind, you know. The worship of Isis was really only an exalted type of moon worship. The crescent moon, you may remember, was one of her most sacred emblems."

Bolton paused and looked at the Doctor suspiciously.

"What are you doing—pulling my leg?" he demanded.

"Not at all, my dear fellow. Carnes, doesn't the sight of the glowing orb of night influence you to pious meditation upon the frailty of human life and the insignificance of human ambition?"

"Not to any very great degree," replied Carnes dryly.

"Carnesy, old dear, I fear that you are a crass materialist. I am beginning to despair of ever inculcating in you any respect for the finer and subtler things of life. I must try Bolton. Bolton, have you ever seen a finer moon? Remember that I won't move a step until you have carefully considered the matter and fully answered my question."

Bolton looked first at the Doctor, then at Carnes, and finally he looked reluctantly at the moon.

"It's a fine one," he admitted, "but all full moons look large on clear nights at this time of the year."

"Then you *have* studied the moon?" cried Dr. Bird with delight. "I was sure—"

He broke off his speech suddenly and listened. From a distance came the mournful howl of a dog. It was answered in a moment by another howl from a different direction. Dog after dog took up the chorus until the air was filled with the melancholy wailing of the animals.

"See, Bolton," remarked the Doctor, "even the dogs feel the chastening influence of the Lady of Night and repent of the sins of their youth and the follies of their manhood, or should one say doghood? Come along. I feel that the call of duty must tear us away from the contemplation of the beauties of nature."

He led the way to Bolton's car and got in without

further words. A half-hour later, Bolton led the way into the White House. A word to the secret service operative on guard at the door admitted him and his party, and he led the way to the newly constructed solarium where the President slept. An operative stood outside the door.

"What word, Brady?" asked Bolton in a whisper.

"He seems worse, sir. I doubt if he has slept at all. Admiral Clay has been in several times, but he didn't do much good. There, listen! The President is getting up again."

From behind the closed door which confronted them came sounds of a person rising from a bed and pacing the floor, slowly at first, and then more and more rapidly, until it was almost a run. A series of groans came to the watchers and then a long drawn out howl. Bolton shuddered.

"Poor devil!" he muttered.

Dr. Bird shot a quick glance around.

"Where is Admiral Clay?" he asked.

"He is sleeping upstairs. Shall I call him?"

"No. Take me to his room."

The President's naval physician opened the door in response to Bolton's knock.

"Is he worse?" he demanded anxiously.

"I don't think so, Admiral," replied Bolton. "I want to introduce you to Dr. Bird of the Bureau of Standards. He wants to talk with you about the case."

"I am honored, Doctor," said the physician as he grasped the scientist's outstretched hand. "Come in. Pardon my appearance, but I was startled out of a doze when you knocked. Have a chair and tell me how I can serve you."

Dr. Bird drew a notebook from his pocket.

"I have received certain dates in connection with the

President's malady from Operative Carnes," he said, "and I wish you to verify them."

"Pardon me a moment, Doctor," interrupted the Admiral, "but may I ask what is your connection with the matter? I was not aware that you were a physician or surgeon."

"Dr. Bird is here by the authority of the secret service," replied Bolton. "He has no connection with the medical treatment of the President, but permit me to remind you that the secret service is responsible for the safety of the President and so have a right to demand such details about him as are necessary for his proper protection."

"I have no intention in obstructing you in the proper performance of your duties, Mr. Bolton," began the Admiral stiffly.

"Pardon me, Admiral," broke in Dr. Bird, "it seems to me that we are getting started wrong. I suspect that certain exterior forces are more or less concerned in this case and I have communicated my suspicions to

Mr. Bolton. He in turn brought me here in order to request from you your cooperation in the matter. We have no idea of demanding anything and are really seeking help which we believe that you can give us."

"Pardon me, Admiral," said Bolton. "I had no intention of angering you."

"I am at your service, gentlemen," replied Admiral Clay. "What information did you wish, Doctor?"

"At first merely a verification of the history of the case as I have it."

Dr. Bird read the notes he had taken down from Carnes and the Admiral nodded agreement.

"Those dates are correct," he said.

"Now, Admiral, there are two further points on which I wish enlightenment. The first is the opthalmia which is troubling the patient."

"It is nothing to be alarmed about as far as symptoms

go, Doctor," replied the Admiral. "It is a rather mild case of irritation, somewhat analogous to granuloma, but rather stubborn. He had an attack several weeks ago and while it did not yield to treatment as readily as I could have wished, it did clear up nicely in a couple of weeks and I was quite surprised at this recurrent attack. His sight is in no danger."

"Have you tried to connect this opthalmia with his mental aberrations?"

"Why no, Doctor, there is no connection."

"Are you sure?"

"I am certain. The slight pain which his eyes give him could never have such an effect upon the mind of so able and energetic a man as he is."

"Well, we'll let that pass for the moment. The other question is this: has he any form of skin trouble?"

The Admiral looked up in surprise.

"Yes, he has," he admitted. "I had mentioned it to no one, for it really amounts to nothing, but he has a slight attack of some obscure form of dermatitis which I am treating. It is affecting only his face and hands."

"Please describe it."

"It has taken the form of a brown pigmentation on the hands. On the face it causes a slight itching and subsequent peeling of the affected areas."

"In other words, it is acting like sunburn?"

"Why, yes, somewhat. It is not that, however, for he has been exposed to the sun very little lately, on account of his eyes."

"I notice that he is sleeping in the new solarium which was added last winter to the executive mansion. Can you tell me with what type of glass it is equipped?"

"Yes. It is not equipped with glass at all, but with fused quartz."

"When did he start to sleep there?"

"As soon as it was completed."

"And all the time the windows have been of fused quartz?"

"No. They were glazed at first, but the glass was removed and the fused quartz substituted at my suggestion about two months ago, just before this trouble started."

"Thank you, Admiral. You have given me several things to think about. My ideas are a little too nebulous to share as yet but I think that I can give you one piece of very sound advice. The President is spending a very restless night. If you would remove him from the solarium and get him to lie down in a room which is glazed with ordinary glass, and pull down the shades so that he will be in the dark, I think that he will pass a better night."

Admiral Clay looked keenly into the piercing black eyes of the Doctor.

"I know something of you by reputation, Bird," he said slowly, "and I will follow your advice. Will you tell me why you make this particular suggestion?"

"So that I can work in that solarium to-night without interruption," replied Dr. Bird. "I have some tests which I wish to carry out while it is still dark. If my results are negative, forget what I have told you. If they yield any information, I will be glad to share it with you at the proper time. Now get the President out of that solarium and tell me when the coast is clear."

The Admiral donned a dressing gown and stepped out of the room. He returned in fifteen minutes.

"The solarium is at your disposal, Doctor," he announced. "Shall I accompany you?"

"If you wish," assented Dr. Bird as he picked up his apparatus and strode out of the room.

In the solarium he glanced quickly around, noting the position of each of the articles of furniture.

"I presume that the President always sleeps with his head in this direction?" he remarked, pointing to the pillow on the disturbed bed.

The Admiral nodded assent. Dr. Bird opened the bag which he had packed in his laboratory, took out a sheet of cardboard covered with a metallic looking substance, and placed it on the pillow. He stepped back and donned a pair of smoked glasses, watching it intently. Without a word he took off the glasses and handed them to the Admiral. The Admiral donned them and looked at the pillow. As he did so an exclamation broke from his lips.

"That plate seems to glow," he said in an astonished voice.

Dr. Bird stepped forward and laid his hand on the pillow. He was wearing a wrist watch with a radiolite dial. The substance suddenly increased its luminescence and began to glow fiercely, long luminous streamers seeming to come from the dial. The Doctor took away his hand and substituted a bottle of liquid for the plate on the pillow.

Immediately the bottle began to glow with a phosphorescent light.

"What on earth is it?" gasped Carnes.

"Excitation of a radioactive fluid," replied the Doctor.

"The question is, what is exciting it. Somebody get a stepladder."

While Bolton was gone after the ladder, the Doctor took from his bag what looked like an ordinary pane of glass.

"Take this, Carnes," he directed, "and start holding it over each of those panes of quartz which you can reach. Stop when I tell you to."

The operative held the glass over each of the panes in succession, but the Doctor, who kept his eyes covered with the smoked glasses and fastened on the plate which he had replaced on the pillow, said nothing. When Bolton arrived with the ladder, the process went on. One end and most of the front of the solarium had been covered before an exclamation

from the Doctor halted the work.

"That's the one," he exclaimed. "Hold the glass there for a moment."

[Image description start: A black and white illustration from the story The Ray of Madness, by Sterner St. Paul Meek. The left half of the illustration shows only the foreground, with a blank white background, showing two characters standing near a bed. The right half of the drawing shows the background, revealing that the ceiling of the room is

made of curved glass like a greenhouse. Carnes, also in a military uniform, is standing on a ladder, holding one of the panes of glass, while Bolton, the assistant, stands at the base holding the ladder steady with one hand. Dr. Bird, in a suit, stands at the head of the bed, with a suitcase and box of tools at his feet as he leans over the pillow, upon which rests a shining square of glass. Admiral Clay, in a long military uniform, stands at the foot of the bed, and has his hands in his pockets as he watches Dr. Bird. Image description end.]

Hurriedly he removed the plate from the pillow and replaced the phial of liquid. There was only a very feeble glow.

"Good enough," he cried. "Take away the glass, but mark that pane, and be ready to replace it when I give the word."

From the instrument case he had brought he took out a spectroscope. He turned back the mattress and mounted it on the bedstead.

"Cover that pane," he directed.

Carnes did so, and the Doctor swung the receiving tube of the instrument until it pointed at the covered pane. He glanced into the eyepiece, and then held a tiny flashlight for an instant opposite the third tube.

"Uncover that pane," he said.

Carnes took down the glass plate and the Doctor gazed into the instrument. He made some adjustments.

"Are you familiar with spectroscopy, Admiral?" he asked.

"Somewhat."

"Take a squint in here and tell me what you see."

The Admiral applied his eye to the instrument and looked long and earnestly.

"There are some lines there, Doctor," he said, "but

your instrument is badly out of adjustment. They are in what should be the ultra-violet sector, according to your scale."

"I forgot to tell you that this is a fluoroscopic spectroscope designed for the detection of ultra-violet lines," replied Dr. Bird. "Those lines you see are ultra-violet, made visible to the eye by activation of a radioactive compound whose rays in turn impinge on a zinc blende sheet. Do you recognize the lines?"

"No, I don't."

"Small wonder; I doubt whether there are a dozen people who would. I have never seen them before, although I recognize them from descriptions I have read. Bolton, come here. Sight along this instrument and through that plate of glass which Carnes is holding and tell me what office that window belongs to."

Bolton sighted as directed up at the side of the State, War and Navy Building.

"I can't tell exactly at this time of night, Doctor," he said, "but I'll go into the building and find out."

"Do so. Have you a flashlight?"

"Yes."

"Flash it momentarily out of each of the suspected windows in turn until you get an answering flash from here. When you do, flash it out of each pane of glass in the window until you get another flash from here. Then come back and tell me what office it is. Mark the pane so that we can locate it again in the morning."

"It is the office of the Assistant to the Adjutant General of the Army," reported Bolton ten minutes later.

"What is there in the room?"

"Nothing but the usual desks and chairs."

"I suspected as much. The window is merely a

reflector. That is all that we can do for to-night, gentlemen. Admiral, keep your patient quiet and in a room with *glass* windows, preferably with the shades drawn, until further notice. Bolton, meet me here with Carnes at sunrise. Have a picked detail of ten men standing by where we can get hold of them in a hurry. In the mean time, get the Chief of Air Service out of bed and have him order a plane at Langley Field to be ready to take off at 6 A. M. He is not to take off, however, until I give him orders to do so. Do you understand?"

"Everything will be ready for you, Doctor, but I confess that I don't know what it is all about."

"It's the biggest case you ever tackled, old man, and I hope that we can pull it off successfully. I'd like to go over it with you now, but I'll be busy at the Bureau for the rest of the night. Drop me off there, will you?"

At sunrise the next morning, Bolton met Dr. Bird at the entrance to the White House grounds.

"Where is your detail?" he asked.

"In the State, War and Navy Building."

"Good. I want to go to the solarium, put a light on the place where the President's pillow was last night, and mark that pane of quartz we were looking through. Then we'll join the detail."

Dr. Bird placed the light and walked with Carnes across the White House grounds. Bolton's badge secured admission to the State, War and Navy Building for the party and they made their way to the office of the Assistant to the Adjutant General.

"Did you mark the pane of glass through which you flashed your light last night, Bolton?" asked the Doctor.

The detective touched one of the panes.

"Good," exclaimed the Doctor. "I notice that this window has hooks for a window washer's belt. Get a life belt, will you?"

When the belt was brought, the Doctor turned to

Carnes.

"Carnes," he said, "hook on this life saver and climb out on the window ledge. Take this piece of apparatus with you."

He handed Carnes a piece of apparatus which looked like two telescopes fastened to a base, with a screw adjustment for altering the angles of the barrels.

Carnes took it and looked at it inquiringly.

"That is what I was making at the Bureau last night," explained Dr. Bird. "It is a device which will enable me to locate the source of the beam which was reflected from this pane of glass onto the President's pillow. I'll show you how to work it. You know that when light is reflected the angle of reflection always equals the angle of incidence? Well, you place these three feet against the pane of glass, thus putting the base of the instrument in a plane parallel to the pane of glass. By turning these two knobs, one of which gives lateral and the other vertical adjustment, you will manipulate the instrument until the first

telescope is pointing directly toward the President's pillow. Now notice that the two telescope barrels are fastened together and are connected to the knobs, so that when the knobs are turned, the scopes are turned in equal and opposite amounts. When one is turned from its present position five degrees to the west, the other automatically turns five degrees to the east. When one is elevated, the other is correspondingly depressed. Thus, when the first tube points toward the pillow, the other will point toward the source of the reflected beam."

"Clever!" ejaculated Bolton.

"It is rather crude and may not be accurate enough to locate the source exactly, but at least it will give us a pretty good idea of where to look. Given time, a much more accurate instrument could have been made, but two telescopic rifle sights and a theodolite base were all the materials I could find to work with. Climb out, Carnesy, and do your stuff."

Carnes climbed out on the window and fastened the hooks of the life saver to the rings set in the window

casings. He sat the base of the instrument against the pane of glass and manipulated the telescope knobs as Dr. Bird signalled from the inside. The scientist was hard to please with the adjustment, but at last the cross hairs of the first telescope were centered on the light in the solarium. He changed his position and stared through the second tube.

"The angle is too acute and the distance too great for accuracy," he said with an air of disappointment. "The beam comes from the roof of a house down along Pennsylvania Avenue, but I can't tell from here which one it is. Take a look, Bolton."

The Chief of the Secret Service stared through the telescope.

"I couldn't be sure, Doctor," he replied. "I can see something on the roof of one of the houses, but I can't tell what it is and I couldn't tell the house when I got in front of it."

"It won't do to make a false move," said the Doctor. "Did you arrange for that plane?"

"It is waiting your orders at the field, Doctor."

"Good. I'll go up to the office of the Chief of Air Service and get in touch with the pilot over the Chief's private line. There are some orders that I wish to give him and some signals to be arranged."

Dr. Bird returned in a few minutes.

"The plane is taking off now and will be over the city soon," he announced. "We'll take a stroll down the Avenue until we are in the vicinity of the house, and then wait for the plane. Carnes will take five of your men and go down behind the house and the rest of us will go in front. Which building do you think it is, Bolton?"

"About the fourth from the corner."

"All right, the men going down the back will take station behind the house next to the corner and the rest of us will get in front of the same building. When the plane comes over, watch it. If you receive no signal, go to the next house and wait for him to make

a loop and come over you again. Continue this until the pilot throws a white parachute over. That is the signal that we are covering the right house. When you get that signal, Carnes, leave two men outside and break in with the other three. Get that apparatus on the roof and the men who are operating it. Bolton and I will attack the front door at the same time. Does everybody understand?"

Murmurs of assent came from the detail.

"All right, let's go. Carnes, lead out with your men and go half a block ahead so that the two parties will arrive in position at about the same time."

Carnes left the building with five of the operatives. Dr. Bird and Bolton waited for a few minutes and then started down Pennsylvania Avenue, the five men of their squad following at intervals. For three-quarters of a mile they sauntered down the street.

"This should be it, Doctor," said Bolton.

"I think so, and here comes our plane."

They watched the swift scout plane from Langley Field swing down low over the house and then swoop up into the sky again without making a signal. The party walked down the street one house and paused. Again the plane swept over them without sign. As they stopped in front of the next house a white parachute flew from the cockpit of the plane and the aircraft, its mission accomplished, veered off to the south toward its hangar.

"This is the place," cried Bolton. "Haggerty and Johnson, you two cover the street. Bemis, take the lower door. The rest come with me."

Followed closely by Dr. Bird and two operatives, Bolton sprinted across the street and up the steps leading to the main entrance of the house. The door was barred, and he hurled his weight against it without result.

"One side, Bolton," snapped Dr. Bird.

The diminutive Chief drew aside and Dr. Bird's two hundred pounds of bone and muscle crashed against

the door. The lock gave and the Doctor barely saved himself from sprawling headlong on the hall floor. A woman's scream rang out, and the Doctor swore under his breath.

"Upstairs! To the roof!" he cried.

Followed by the rest of the party, he sprinted up the stairway which opened before him. Just as he reached the top his way was barred by an Amazonian figure in a green bathrobe.

"Who th' divil arre yer?" demanded an outraged voice.

"Police," snapped Bolton. "One side!"

"Wan side, is it?" demanded the fiery haired Amazon.

"The divil a stip ye go until ye till me ye'er bizness.

Phwat th' divil arre yer doin' in th' house uv a rayspictable female at this hour uv th' marnin'?"

"One side, I tell you!" cried Bolton as he strove to push past the figure that barred the way.

"Oh, ye wud, wud yer, little mann?" demanded the Irishwoman as she grasped Bolton by the collar and shook him as a terrier does a rat. Dr. Bird stifled his laughter with difficulty and seized her by the arm. With a heave on Bolton's collar she raised him from the ground and swung him against the Doctor, knocking him off his feet.

"Hilp! P'lice! Murther!" she screamed at the top of her voice.

"Damn it, woman, we're on—"

Dr. Bird's voice was cut short by the sound of a pistol shot from the roof, followed by two others. The Irishwoman dropped Bolton and slumped into a sitting position and screamed lustily. Bolton and Dr. Bird, with the two operatives at their heels, raced for the roof. Before they reached it another volley of shots rang out, these sounding from the rear of the building. They made their way to the upper floor and found a ladder running to a skylight in the roof. At the foot of the ladder stood one of Carnes' party.

"What is it, Williams?" demanded Bolton.

"I don't know, Chief. Carnes and the other two went up there, and then I heard shooting. My orders were to let no one come down the ladder."

As he spoke, Carnes' head appeared at the skylight.

"It's the right place, all right, Doctor," he called.

"Come on up, the shooting is all over."

Dr. Bird mounted the ladder and stepped out on the roof. Set on one edge was a large piece of apparatus, toward which the scientist eagerly hastened. He bent over it for a few moments and then straightened up.

"Where is the operator?" he asked.

Carnes silently led the way to the edge of the roof and pointed down. Dr. Bird leaned over. At the foot of the fire escape he saw a crumpled dark heap, with a secret service operative bending over it.

"Is he dead, Olmstead?" called Carnes.

"Dead as a mackerel," came the reply. "Richards got him through the head on his first shot."

"Good business," said Dr. Bird. "We probably could never have secured a conviction and the matter is best hushed up anyway. Bolton, have two of your men help me get this apparatus up to the Bureau. I want to examine it a little. Have the body taken to the morgue and shut up the press. Find out which room the chap occupied and search it, and bring all his papers to me. From a criminal standpoint, this case is settled, but I want to look into the scientific end of it a little more."

"I'd like to know what it was all about, Doctor," protested Bolton. "I have followed your lead blindly, and now I have a housebreaking without search-warrant and a killing to explain, and still I am about as much in the dark as I was at the beginning."

"Excuse me, Bolton," said Dr. Bird contritely; "I didn't mean to slight you. Admiral Clay wants to know about it and so does Carnes, although he knows me too well to say so. As soon as I have digested the case I'll let you know and I'll go over the whole thing with you."

A week later Dr. Bird sat in conference with the President in the executive office of the White House. Beside him sat Admiral Clay, Carnes and Bolton.

"I have told the President as much as I know, Doctor," said the Admiral, "and he would like to hear the details from your lips. He has fully recovered from his malady and there is no danger of exciting him."

"I cannot read Russian," said Dr. Bird slowly, "and so was forced to depend on one of my assistants to translate the papers which Mr. Bolton found in Stokowsky's room. There is nothing in them to definitely connect him with the Russian Union of Soviet Republics, but there is little doubt in my mind that he was a Red agent and that Russia supplied the money which he spent. It would be disastrous to Russia's plans to have too close an accord between this country and the British Empire, and I have no doubt that the coming visit of Premier McDougal was the underlying cause of the attempt. So much for the reason.

"As to how I came to suspect what was happening,

the explanation is very simple. When Carnes first told me of your malady, Mr. President, I happened to be checking Von Beyer's results in the alleged discovery of a new element, lunium. In the article describing his experiments, Von Beyer mentions that when he tried to observe the spectra, he encountered a mild form of opthalmia which was quite stubborn to treatment. He also mentions a peculiar mental unbalance and intense exhilaration which the rays seemed to cause both in himself and in his assistants. The analogy between his observations and your case struck me at once.

"For ages the moon has been an object of worship by various religious sects, and some of the most obscene orgies of which we have record occurred in the moonlight. The full moon seems to affect dogs to a state of partial hypnosis with consequent howling and evident pain in the eyes. Certain feeble minded persons have been known to be adversely affected by moonlight as well as some cases of complete mental aberration. In other words, while moonlight has no practical effect on the normal human in its usual

concentration, it does have an adverse effect on certain types of mentality and, despite the laughter of medical science, there seems to be something in the theory of 'moon madness.' This effect Von Beyer attributed to the emanations of lunium, which element he detected in the spectra of the moon, in the form of a wide band in the ultra-violet region.

"I obtained from Carnes a history of your case, and when I found that your attacks grew violent with the full moon and subsided with the new moon, I was sure that I was on the right track, although I had at that time no way of knowing whether it was from natural or artificial causes that the effect was being produced. I interviewed Admiral Clay and found that you were suffering from a form of dermatitis resembling sunburn, and that convinced me that an attack was being made on your sanity, for an excess of ultra-violet light will always tend to produce sunburn. I inquired about the windows of your solarium, for ultra-violet light will not pass through a lead glass. When the Admiral told me that the glass had been replaced with fused quartz, which is quite permeable

to ultra-violet and that the change had been almost coincident with the start of your malady, I asked him to get you out of the solarium and let me examine it.

"By means of certain fluorescent substances which I used, I found that your pillow was being bathed in a flood of ultra-violet light, and the fluoro-spectroscope soon told me that lunium emanations were present in large quantities. These rays were not coming to you directly from their source, but one of the windows of the State, War and Navy Building was being used as a reflector. I located the approximate source of the ray by means of an improvised apparatus, and we surrounded the place. Stokowsky was killed while attempting to escape. I guess that is about all there is to it."

"Thank you, Doctor," said the President. "I would be interested in a description of the apparatus which he used to produce this effect."

"The apparatus was quite simple, Sir. It was merely a large collector of moonlight, which was thrown after collection onto a lunium plate. The resultant

emanations were turned into a parallel beam by a parabolic reflector and focused, through a rock crystal lens with an extremely long focal length, onto your pillow."

"Then Stokowsky had isolated Von Beyer's new element?" asked the President.

"I am still in doubt whether it is a new element or merely an allotropic modification of the common element, cadmium. The plate which he used has a very peculiar property. When moonlight, or any other reflected light of the same composition falls on it, it acts on the ray much as the button of a Roentgen tube acts on a cathode ray. As the cathode ray is absorbed and an entirely new ray, the X-ray, is given off by the button, just so is the reflected moonlight absorbed and a new ray of ultra-violet given off. This is the ray which Von Beyer detected. I thought that I could catch traces of Von Beyer's lines in my spectroscope, and I think now that it is due to a trace of lunium in the cadmium plating of the barrels. Von Beyer could have easily made the same mistake. Von Beyer's work, together with Stokowsky's opens up an entirely new

field of spectroscopic research. I would give a good deal to go over to Baden and go into the matter with Von Beyer and make some plans for the exploitation of the new field, but I'm afraid that my pocketbook wouldn't stand the trip."

"I think that the United States owes you that trip, Dr. Bird," said the Chief Executive with a smile. "Make your plans to go as soon as you get your data together. I think that the Treasury will be able to take care of the expense without raising the income tax next year."

May 1930

#25 Murder Madness, By Murray Leinster:

Murder madness! Seven secret service men had completely disappeared. Another had been found a screaming, homicidal maniac, whose fingers writhed like snakes. So Bell, of the secret "Trade," plunges into South America after the master—the mighty, unknown octopus of power whose diabolical poison threatens a continent!

Aproximate word count: 63,200

Chapter 1

The engines of the *Almirante Gomez* were going dead slow. Away up beside her monster funnels her siren blew dismally, *Whoo-oo-oo-oo!* and was silent for the regulation period, and blew desolately again into the clinging gray mist that ringed her all about.

Her decks were wet and glistening. Droplets of water stood upon the deck-stanchions, and dripped from the outer edge of the roof above the promenade deck. A thin, swirling fog lay soggy upon the water and the big steamer went dead slow upon her course, sending dismal and depressing blasts from her horn from time to time. It was barely possible to see from one side of the ship to the other. It was surely impossible to see the bow from a point half astern.

Charley Bell went forward along the promenade deck. He passed Senor Ortiz, ex-Minister of the Interior of the Argentine Republic. Ortiz bowed to him punctiliously, but Bell had a sudden impression that the Argentine's face was gray and ghastly. He checked himself and looked back. The little man was climbing the companion-ladder toward the wireless room.

Bell slipped on toward the bow. He did not want to give an impression of furtiveness, but the *Almirante Gomez* was twelve days out of New York and Bell was still entirely ignorant of why he was on board. He had been called into the office of his chief in the State

Department and told curtly that his request for leave of absence had been granted. And Bell had not asked for a leave of absence. But at just that moment he saw a rubber band on the desk of his immediate superior, a fairly thick rubber band which had been tied into a certain intricate knot. And Bell had kept quiet. He went to his apartment, found his bags packed and tickets to Rio via the *Almirante Gomez* in an envelope on his dressing-table, and went out and caught a train to the ship.

And that was all he knew. The siren up above blared dolefully into the fog. It was damp, and soggy, and depressing. The other passengers were under cover, and the decks seemed to be deserted. From the saloon came the sound of music. Bell pulled the collar of his light topcoat about his throat and strolled on toward the bow.

He faced a row of steamer chairs. There was a figure curled up in one of them. Paula Canalejas, muffled up against the dampness and staring somberly out into the mist. Bell had met her in Washington and liked her a great deal, but he swore softly at sight of her in

his way.

The afternoon before, he had seen a stoker on the *Almirante Gomez* pick up a bit of rope and absently tie knots in it while he exchanged Rabelasian humor with his fellows. He had not looked at Bell at all, but the knots he tied were the same that Bell had last seen tied in a rubber band on a desk in the State Department in Washington. And Bell knew a recognition signal when he saw one. The stoker would be off watch, just now, and by all the rules of reason he ought to be out there on the forecastle, waiting for Bell to turn up and receive instructions.

But Bell paused, lit a cigarette carefully, and strolled forward.

"Mr. Bell."

He stopped and beamed fatuously at her. It would have been logical for him to fall in love with her, and it is always desirable to seem logical. He had striven painstakingly to give the impression that he had fallen in love with her—and then had striven even more

painstakingly to keep from doing it.

"Hullo," he said in bland surprise. "What are you doing out on deck?"

Brown eyes regarded him speculatively.

"Thinking," she said succinctly. "About you, Mr. Bell."

Bell beamed.

"Thinking," he confided, "is usually a bad habit, especially in a girl. But if you must think, I approve of your choice of subjects. What were you thinking about me?"

The brown eyes regarded him still more speculatively.

"I was wondering—" said Paula, glancing to either side, "I was wondering if you happen to be—er—a member of the United States Secret Service."

Bell laughed with entire naturalness.

"Good Lord, no!" he said amusedly. "I have a desk in

the State Department building, and I read consular reports all day long and write letters bedeviling the consuls for not including unavailable statistics in their communications. That's my work. I'm on leave now."

She looked skeptical and, it may be, disappointed.

"You look as if you didn't believe me," said Bell, smiling. "I give you my word of honor I'm not a member of the United States Secret Service. Will that do to relieve your suspicions?"

"I believe you," she said slowly, "but it does not relieve my mind. I shall think about other people. I have something important to tell a member of the United States Secret Service."

Bell shrugged.

"I'm sorry," he said amiably, "that I can't oblige you by tipping one of them off. That's what you wanted me to do, isn't it?"

She nodded, and the gesture was very much like a

dismissal. Bell frowned, hesitated, and went on. He was anxious to meet the stoker, but this....

The siren droned dismally over his head. Fog lay deep about the ship. The washing of the waves and dripping of water on the decks was depressing. It seemed to be getting thicker. Four stanchions ahead, the mist was noticeable. He found that he could count five, six, seven.... The eighth was indefinite. But a bar materialized in the fog before him, and the grayness drew away before him and closed in behind. When he was at the forward end of the promenade, looking down upon the forecastle deck, he was isolated. He heard footsteps some distance overhead. The watch officer up on the bridge. Bell glanced up and saw him as an indistinct figure. He waited until the officer paced over to the opposite side of the bridge. The air throbbed and shook with the roaring of the siren.

Bell slipped over the edge of the rail and swung swiftly down the little ladder of iron bars set into the ship's structure. In seconds he had landed, and was down upon that terra incognita of all passengers, the deck reserved for the use of the crew.

A mast loomed overhead, with its heavy, clumsy derrick-booms. A winch was by his side. Oddments of deck machinery, inexplicable to a landsman, formed themselves vaguely in the mist. The fog was thicker, naturally, since the deck was closer to the water's edge.

"Hey!" growled a voice close beside him. "Passengers ain't allowed down here."

An unshaven, soot-smeared figure loomed up. Bell could not see the man save as a blur in the mist, but he said cheerfully:

"I know it, but I wanted to look. Seafaring's a trade I'd like to know something about."

The figure grunted. Bell had just given his word of honor that he wasn't a member of the Secret Service. He wasn't. But he was in the Trade—which has no official existence anywhere. And the use of the word in his first remark was a recognition signal.

"What is your trade, anyways?" growled the figure

skeptically.

"I sharpen serpents' teeth from time to time," offered Bell amiably. He recognized the man, suddenly.

"Hullo, Jamison, you look like the devil."

Jamison drew nearer. He grunted softly.

"I know it. Listen closely, Bell. Your job is getting some information from Canalejas, Minister of War in Rio. He sent word up to Washington that he'd something important to say. It isn't treachery to Brazil, because he's a decent man. Seven Secret Service men have disappeared in South America within three months. They've found the eighth, and he's crazy. Something has driven him mad, and they say it's a devilish poison. He's a homicidal maniac, returning to the United States in a straight-jacket. Canalejas knows what's happened to the Service men. He said so, and he's going to tell us. His daughter brought the news to Washington, and then instead of going on to Europe as she was supposed to do, she started back to Rio. You're to get this formation and pass it on to me, then try to keep your skin whole and

act innocent. You were picked out because, as a State Department man, hell could be raised if you vanished. Understand?"

Bell nodded.

"Something horrible is going on. Secret Service can't do anything. The man in Asunción isn't dead—he's been seen—but he's cut loose. And Service men don't often do that. He don't report. That means the Service code may have been turned over, and hell to pay generally. It's up to the Trade."

"I've got it," said Bell. "Here are two items for you. Miss Canalejas just said she suspected I was Secret Service. I convinced her I wasn't. She says she has important information for a Service man."

The brawny figure of the stoker growled.

"Damn women! She was told somebody'd be sent to see her father. She was shown a recognition-knot with the outsider's variation. Given one, for father. That'll identify you to him. But she shouldn't have talked.

Now, be careful. As nearly as we know, that chap in the straight-jacket was given some poison that drove him insane. There are hellish drugs down there. Maybe the same thing happened to others. Look out for yourself, and give me the information Canalejas gives you as quickly as God will let you. If anything happens to you, we want the stuff to get back. Understand?"

"Of course," said Bell. He carefully did not shiver as he realized what Jamison meant by anything happening to him. "The other item is that Ortiz, ex-Minister of the Interior of the Argentine, is scared to death about something. Sending radios right and left."

"Umph," growled Jamison. "One of our men vanished in Buenos Aires. Watch him. You're friendly?"

"Yes."

"Get friendlier. See what he's got. Now shoo."

Bell swung up the ladder again. Mist opened before

him and closed again behind. He climbed over the rail to the promenade deck, and felt a little flare of irritation. There was a figure watching him.

He slipped to the deck and grinned sheepishly at Paula Canalejas. She stood with her hands in the pockets of her little sport coat, regarding him very gravely.

"I suppose," said Charley Bell sheepishly, "that I look like a fool. But I've always wanted to climb up and down that ladder. I suppose it's a survival from the age of childhood. At the age of seven I longed to be a fireman."

"I wonder," said Paula quietly. "Mr. Bell"—she stepped close to him—"I am taking a desperate chance. For the sake of my father, I wish certain things known. I think that you are an honorable man, and I think that you lied to me just now. Go and see Senor Ortiz. Your government will want to know what happens to him. Go and see him quickly."

Bell felt the same flare of irritation as before. Women

do not follow rules. They will not follow rules. They depend upon intuition, which is sometimes right, but sometimes leads to ungodly errors. Paula was right this time, but she could have been wholly and hopelessly wrong. If she had talked to anyone else....

"My child," said Bell paternally—he was at least two years older than Paula—"you should be careful. I did not lie to you just now. I am not Secret Service. But I happen to know that you have a tiny piece of string to give your father, and I beg of you not to show that to anyone else. And—well—you are probably watched. You must not talk seriously to me!"

He lifted his hat and started astern. He was more than merely irritated. He was almost frightened. Because the Trade, officially, does not exist at all, and everybody in the Trade is working entirely on his own; and because those people who suspect that there is a Trade and dislike it are not on their own, but have plenty of resources behind them. And yet it is requisite that the Trade shall succeed in its various missions. Always.

The Government of the United States, you understand, will admit that it has a Secret Service, which it strives to identify solely with the pursuit of counterfeiters, postal thieves, and violators of the prohibition laws. Strongly pressed, it will admit that some members of the Secret Service work abroad, the official explanation being that they work abroad to forestall smugglers. And at a pinch, and in confidence, it may concede the existence of diplomatic secret agents. But there is no such thing as the Trade. Not at all. The funds which members of the Trade expend are derived by very devious bookkeeping from the appropriations allotted to an otherwise honestly conducted Department of the United States Government.

Therefore the Trade does not really exist. You might say that there is a sort of conspiracy among certain people to do certain things. Some of them are government officials, major and minor. Some of them are private citizens, reputable and otherwise. One or two of them are in jail, both here and abroad. But as far as the Government of the United States is

concerned, certain fortunate coincidences that happen now and then are purely coincidences. And the Trade, which arranges for them, does not exist. But it has a good many enemies.

The fog-horn howled dismally overhead. Mist swirled past the ship, and an oily swell surged vaguely overside and disappeared into a gray oblivion half a ship's length away. Bell moved on toward the stern. It was his intention to go into the smoking-room and idle ostentatiously. Perhaps he would enter into another argument with that Brazilian air pilot who had so much confidence in Handley-Page wing-slots. Bell had, in Washington, a small private plane that, he explained, had been given him by a wealthy aunt, who hoped he would break his neck in it. He considered that wing-slots interfered with stunting.

He had picked out the door with his eye when he espied a small figure standing by the rail. It was Ortiz, the Argentine ex-Cabinet Minister, staring off into the grayness, and seeming to listen with all his ears.

Bell slowed up. The little stout man turned and

nodded to him, and then put out his hand.

"Senor Bell," he said quietly, "tell me. Do you hear airplane motors?"

Bell listened. The drip-drip-drip of condensed mist. The shuddering of the ship with her motors going dead slow. The tinkling, muted notes of the piano inside the saloon. The washing and hissing of the waves overside. That was all.

"Why, no," said Bell. "I don't. Sound travels freakishly in fog, though. One might be quite close and we couldn't hear it. But we're a hundred and fifty miles off the Venezuelan coast, aren't we?"

Ortiz turned and faced him. Bell was shocked at the expression on the small man's face. It was drained of all blood, and its look was ghastly. But the rather fine dark eyes were steady.

"We are," agreed Ortiz, very steadily indeed, "but I—I have received a radiogram that some airplane should fly near this ship, and it would amuse me to hear it."

Bell frowned at the fog.

"I've done a good bit of flying," he observed, "and if I were flying out at sea right now, I'd dodge this fog bank. It would be practically suicide to try to alight in a mist like this."

Ortiz regarded him carefully. It seemed to Bell that sweat was coming out upon the other man's forehead.

"You mean," he said quietly, "that an airplane could not land?"

"It might try," said Bell with a shrug. "But you couldn't judge your height above the water. You might crash right into it and dive under. Matter of fact, you probably would."

Ortiz's nostrils quivered a little.

"I told them," he said steadily, "I told them it was not wise to risk...."

He stopped. He looked suddenly at his hands,

clenched upon the rail. A depth of pallor even greater than his previous terrible paleness seemed to leave even his lips without blood. He wavered on his feet, as if he were staggering.

"You're sick!" said Bell sharply. Instinctively he moved forward.

The fine dark eyes regarded him oddly. And Ortiz suddenly took his hands from the railing of the promenade deck. He looked at his fingers detachedly. And Bell could see them writhing, opening and closing in a horribly sensate fashion, as if they were possessed of devils and altogether beyond the control of their owner. And he suddenly realized that the steady, grim regard with which Ortiz looked at his hands was exactly like the look he had seen upon a man's face once, when that man saw a venomous snake crawling toward him and had absolutely no weapon.

Ortiz was looking at his fingers as a man might look at cobras at the ends of his wrists. Very calmly, but with a still, stunned horror.

He lifted his eyes to Bell.

"I have no control over them," he said quietly. "My hands are useless to me, Senor Bell. I wonder if you will be good enough to assist me to my cabin."

Again that deadly pallor flashed across his face. Bell caught at his arm.

"What is the matter?" he demanded anxiously. "Of course I'll help you."

Ortiz smiled very faintly.

"If any airplane arrives in time," he said steadily, "something may be done. But you have rid me of even that hope. I have been poisoned, Senor Bell."

"But the ship's doctor...."

Ortiz, walking rather stiffly beside Bell, shrugged.

"He can do nothing. Will you be good enough to open this door for me? And"—his voice was hoarse for an

instant—"assist me to put my hands in my pockets. I cannot. But I would not like them to be seen."

Bill took hold of the writhing fingers. He saw sweat standing out upon Ortiz's forehead. And the fingers closed savagely upon Bell's hands, tearing at them. Ortiz looked at him with a ghastly supplication.

"Now," he said with difficulty, "if you will open the door, Senor Bell...."

Bell slid the door aside. They went in together. People were making the best of boresome weather within, frankly yawning, most of them. But the card-room would be full, and the smoking-room steward would be busy.

"My cabin is upon the next deck below," said Ortiz through stiff lips. "We—we will descend the stairs."

Bell went with him, his face expressionless.

"My cabin should be unlocked," said Ortiz.

It was. Ortiz entered, and, with his hands still in his pockets, indicated a steamer-trunk.

"Please open that." He licked his lips. "I—I had thought I would have warning enough. It has not been so severe before. Right at the top...."

Bell flung the top back. A pair of bright and shiny handcuffs lay on top of a dress shirt.

"Yes," said Ortiz steadily. "Put them upon my wrists, please. The poison that has been given to me is—peculiar. I believe that one of your compatriots has experienced its effects."

Bell started slightly. Ortiz eyed him steadily.

"Precisely." Ortiz, with his face a gray mask of horror, spoke with a steadiness Bell could never have accomplished. "A poison, Senor Bell, which has made a member of the Secret Service of the United States a homicidal maniac. It has been given to me. I have been hoping for its antidote, but—Quick! Senor Bell! Quick! The handcuffs!"

Chapter 2

The throbbing of the engines went on at an unvarying tempo. There was the slight, almost infinitesimal tremor of their vibration. The electric light in the cabin wavered rhythmically with its dynamo. From the open porthole came the sound of washing water. Now and then a disconnected sound of laughter or of speech came down from the main saloon.

Ortiz lay upon the bed, exhausted.

"It is perhaps humorous, Senor Bell," he said presently, in the same steady voice he had used upon the deck. "It is undoubtedly humorous that I should call upon you. I believe that you are allied with the Secret Service of your government."

Bell started to shake his head, but was still. He said nothing.

"I am poisoned," said Ortiz. He tried to smile, but it was ghastly. "It is a poison which makes a man mad in a very horrible fashion. If I could use my hands—and

could trust them—I would undoubtedly shoot myself. It would be entirely preferable. Instead, I hope—"

He broke off short and listened intently. His forehead beaded.

"Is that an airplane motor?"

Bell went to the port and listened. The washing of waves. The throbbing of the ship's engines. The dismal, long-drawn-out moaning of the fog-horn. Nothing else.... Yes! A dim and distant muttering. It drew nearer and died away again.

"That is a plane," said Bell. "Yes, It's out of hearing now."

Ortiz clamped his jaws together.

"I was about to speak," he said steadily, "to tell you—many things. Which your government should know. Instead, I ask you to go to the wireless room and have the wireless operator try to get in touch with that plane. It is a two-motored seaplane and it has a

wireless outfit. It will answer the call M.S.T.R. Ask him to use his directional wireless and try to guide it to the ship. It brings the antidote to the poison which affects me."

Bell made for the door. Ortiz raised his head with a ghastly smile.

"Close the door tightly," he said quietly. "I—I feel as if I shall be unpleasant."

Closing the door behind him, Bell felt rather like a man in a nightmare. He made for the stairway, bolted for the deck, and fairly darted up the ladder to the wireless room.

"Ortiz sent me," he said to the operator. "You heard that plane just now. See if you can get it."

The operator looked up at him beneath a green eyeshade and grinned crookedly.

"Talking to 'em now," he said.

The key flicked up and down, and a tiny dancing spark leaped into being and vanished beneath its contact-point. The wireless room was dark save for the bright, shaded light above the sending table. A file of sent messages by an elbow. A pad for messages received was by a hand. Stray wreaths of tobacco smoke floated about the room, leaping into view as they drifted beneath the lamp.

"Is he bad?" asked the operator fascinatedly, his eyes fixed on his key.

Bell felt his eyelids flicker.

"Very bad," he said shortly.

"They tell me," said the operator and shuddered, "your hands get working and you can't stop 'em.... I'm playing, I am! I'm playing The Master's game!"

The key stopped. He listened.

"They're going to try to swoop over the ship and drop it," he said a moment later. "I don't think they can.

But tell Ortiz they're going to try."

Bell's eyes were narrow. It is not customary for a radio operator on a passenger ship to speak of an ex-Cabinet Minister of the Argentine Republic by his surname only. It bespeaks either impertinence or a certain very peculiar association. Bell frowned imperceptibly for an instant, thinking.

"You've—had it?" he asked sharply.

"God, no! I never took the chance! I saw the red spots once, and I went to Rib—Say! You got a password?"

He was staring up at Bell. Bell shrugged.

"I'm trying to help Senor Ortiz now."

The operator continued to stare, his eyes full of suspicion. Then he grimaced.

"All right. Go tell him they're going to drop it."

Bell went out. Gray fog, and washing seas, and the

big ship ploughing steadily on toward the south.... The horn blared, startlingly loud and unspeakably doleful. Bell listened for other sounds. There were none.

Down the steep ladder to the promenade deck. Paula Canalejas nodded to him.

"I saw you speak to Senor Ortiz," she said quietly. "You see?"

Bell was beginning to have a peculiar, horrible suspicion. It was incredible, but it was inevitable.

"I think I see," he said harshly. "But I don't dare believe it. Keep quiet and don't speak to me unless I give you some sign it's safe! It's—hellish!"

He went inside and swiftly down the stairs. He found a steward hesitating outside the door of Ortiz's cabin. He touched Bell's arm anxiously as he was about to go in.

"Beg pardon, sir," he said, and stammered. "I—I heard

Mr. Ortiz making some—very strange noises, sir. I—I thought he was sick...."

"He is," said Bell grimly. "He told me he does not want a doctor, though. I'm looking after him."

He closed the door behind him, and Ortiz grinned at him. It was a horrible, a terrible grin, and Ortiz fought it from his face with a terrific effort of will. There was foam about his lips.

"*Dios!* It was—it was devilish!" he gasped. "Senor Bell, *amigo mio*, for the love of the good God get my revolver from my trunk. Give it to me...."

Bell said shortly: "The airplane just radioed that it's going to try to swoop overhead and drop a package on board the steamer. It doesn't dare alight in this fog."

"I think," gasped Ortiz, "I think it would be well to tie my feet. Tie them fast! If—if the package comes, if I—if I am unpleasant, knock me unconscious and pour it into my mouth. I fear it is too late now. But try it...."

Through the port came the muttering of a seaplane's engines. The noise died away. Almost instantly the siren boomed hoarsely.

"Ah, *Dios!*" said Ortiz unsteadily. "There it is! Senor Bell, I think it is too late. Would you—would you assist me to go out on deck, where I might fling myself overboard? I—think I can control my legs so long."

"Steady!" said Bell, wrenched by the sight of the man before him fighting against unnameable horror. "Tell me—"

"It is poison," said Ortiz, his features fixed in a terrible effort of will. "A ghastly, a horrible poison of the *Indios* of Matto Grosso, in Brazil. It drives a man mad, murder mad. It is as if he were possessed by a devil. His hands first refuse to obey him. His feet next. And then his body. It is as if a devil had seized hold of his body and carried it about doing murder with it. A part of the brain is driven insane, and a man goes about shrieking with the horror of what crimes his body commits until the poison reaches that portion of his brain as well. Then he is mad forever.

That is what I face, *amigo mio*. That is why I beg you, I implore you, to kill me or assist me to the side of the ship so that I may fling myself overboard! The Master had it administered to me secretly, and demanded treason as the price of the antidote. He deman—"

Steady and strong, rising from a muttering to a steady roar, the sound of airplane motors came through the port. Bell started up.

"Hold fast," he snapped savagely. "I'll go get that package when it lands. Hold fast, I tell you! Fight it!"

He flung out of the cabin and raced up the stairs. The door to the deck was open. He crowded through a group of passengers who had discounted the dampness for the sake of a novelty—an airplane far out at sea—and raced up to the upper deck. The roaring noise was receding. The siren roared hoarsely. Then the noise came back.

For minutes, then, the ship seemed to play hide-and-seek with the invisible fliers. The roaring noise overhead circled about, now near, now seeming very

far away. And the siren sent its dismal blasts out into the grayness all about. Then, for an instant, a swiftly scudding shadow was visible overhead. It banked steeply and vanished, and seemed to have turned and come lower when it reappeared a moment later. It was not distinct, at first. It was merely a silhouette of darker gray against the all-enveloping mist. But its edges sharpened and became clear. One could make out struts, an aileron's trailing edge.

"Got nerve, anyhow," said Bell grimly.

It swept across the ship and disappeared, but the noise of its engines did not dwindle more than a little. The blast of the siren seemed to summon it back again. Once more it came in sight, and this time it dived steeply, flashed across the forecastle deck amid a hideous uproar, desperately, horribly close to the dangling derrick-cables, and was gone.

Bell had seen it more clearly than anyone else on the ship, perhaps. He saw a man in the pilot's cockpit between wings and tail reach high and fling something downward, something with a long

streamer attached to it. Bell had an instant's glimpse of the goggled face. Then he was darting forward, watching the thing that fell.

It took only a second. Two at most. But the thing seemed to fall with infinite deliberation, the streamer shivering out behind it. It fell at a steep slant, the forward momentum of the plane's speed added to its own drop. It swooped down, slanting toward the rail....

Bell groaned. It struck the rail itself, and bounced. A sailor flung himself toward it. The streamer slipped from his fingers and slithered over the side.

Bell was at the railing just in time to see it drop into the water. He opened his mouth to shout, and saw it sink. The last of the streamer followed the dropped object down into the green water when it was directly below him.

His hands clenched. Bell stared sickly at the spot where it had vanished. An instant later he had whirled and was thrusting wide the wireless room door. The

operator was returning to his key, grinning crookedly. He looked up sidewise.

"Tell them it went overside," snapped Bell. "Tell them to try it again. Ortiz is in hell! To try again! He's dying!"

The operator looked up fascinatedly, his fingers working his key.

"Is he—bad?" he asked with a shuddering interest.

"He's dying!" snarled Bell, in a rage because of his helplessness. He had forgotten everything but the fact that a man below decks was facing the most horrible fate that can overtake a man, and facing it with a steadfast gameness that made Bell's heart go out to him.

"They don't die," said the operator. He shuddered.

"They don't die of it."

His key stopped. He listened. His key clicked again.

"They only had two packages," he said a moment later. "They don't dare risk the other one. They say the fog ends twenty miles farther on. They're going to land up there and taxi back on the surface of the water. It shouldn't be more than half an hour."

He pushed himself back from the table with an air of finality.

"That's all. They've signed off."

Bell felt rage sweeping over him. The operator grinned crookedly.

"Better go down and tie him up," he said, and licked his lips with the fascinated air of one thinking of a known and terrifying thing. "Better tie him up tight. It'll be half an hour more."

Bell went down the companion-ladder. The promenade was crowded with passengers now, asking questions of each other. Some, frowning portentously, thought the plane an unscheduled ocean flier who had lost his way in the fog.

Paula Canalejas was close to Bell as he shouldered his way through the crowd.

"That was for him?" she asked, without moving her lips.

Bell nodded.

"Tell him," she said quietly, "I—pray for him."

Bell nodded abruptly and went into the saloon. It was nearly empty. He wiped the sweat off his face. It was horrible to have to go down to Ortiz and tell him that at best it would be half an hour more....

Then there was a sudden scream below him, and then a shot. Bell jumped for the stairs, his heart in his throat, and saw Ortiz coming out of his stateroom door. His eyes were wide and agonized. His body....

Even in the incredibly short time before he reached the bottom of the steps, Bell had time to receive the ghastly impression that Ortiz was sane, but that his body had gone mad. Ortiz's face was white and

horrified. His hands and arms were writhing savagely, working at the handcuffs on his wrists. His legs were carrying him at a curious, padding trot down the hallway. One of the hands held a glittering revolver. A steward was crouched behind a couch, his face white and filled with stark terror. And Ortiz held his head back, as if struggling to hold back and control his body, which was under the control of a malignant demon.

"Out of the way!" cried Ortiz in a voice of terrible despair. "Get someone to shoot me! Kill me! I cannot —ah, *Dios!*"

The hands leveled the revolver in spite of him, while he flung his head from side to side in a frantic attempt to disturb their aim.

[Image description start: A wide, black and white illustration showing Agent Bell, in a dark suit, stopping just at the base of a set of stairs, with another man crouching behind a couch in front of him. On the other side of the couch is Ortiz, standing with his back towards both of them, his hands twisting the gun he holds towards his own head.

Image description end.]

"Close your eyes!" panted Bell, and hurled himself upon—whom? It was not Ortiz. It was Ortiz's body, gone mad and raging. The manacled arms flailed about frenziedly. The gun went off. Again. Again....

Bell struck. He knocked the Thing that possessed Ortiz's body off its feet. The hands groped for him.

They clubbed at him with the revolver. The feet kicked....

"Keep your eyes closed," gasped Bell, struggling to get the gun away from those horrible hands. "It—it can't see when you keep your eyes closed!"

Fighting insanely as the Thing was fighting, he could not identify it with Ortiz himself. One of the hands unclosed from about the revolver and clawed at his throat. It seemed to abandon that effort and attacked Ortiz's face in a frenzy of rage, struggling to claw his eyes open. The other held the weapon fast with maniacal strength.

At the horror of feeling one of his own manacled hands attacking his face savagely as if it were itself a sensate thing, Ortiz opened his eyes. They were wide with despair.

The hand with the revolver made a sudden movement, and Bell flung his weight upon it as the clutching hand pulled the trigger. There was a deafening report....

The body seemed to weaken suddenly in Bell's grip. It fought less and less terribly, though with no lessening of its savagery. He managed to get the revolver away from the hands that shook with unspeakable rage. He flung it away and stood panting.

There was a crowd of people suddenly all about the place. Staring, stunned, incredulous people who regarded Bell with a dawning, damning suspicion.

Ortiz spoke suddenly. His voice was weak, but it was steady, and it was full of a desperate relief.

"I wish to make a statement," he said sharply. "I—I wished to commit suicide for personal reasons. Senor Bell tried to dissuade me. The handcuffs upon my wrists were placed there with my consent. Senor Bell is my friend and has done me no wrong. I shot myself, with intention."

Bell beckoned to the ship's doctor.

"Get him bandaged up," he ordered harshly. "There's no need for him to die."

The body was writhing only feebly, now. Ortiz looked up at him, and managed a smile. Again there was that incredible impression of the body not belonging to Ortiz, or Ortiz as a sane and whole and honorable, admirable man, and the feebly writhing body with its clutching hands as some evil thing that had properly been defeated and killed.

The doctor bent down. It was useless, of course. He made futile movements.

"I wish to speak to my friend, Senor Bell," said Ortiz weakly. "I—I have not long."

Bell knelt beside him.

"The Master's—deputy in Rio," panted Ortiz weakly, almost in a whisper, "is—is Ribiera. In Buenos Aires I—I do not know. There was a man—the one who poisoned me—but I killed him. Secretly. I do not think—the Master knows. I pray that—"

He stopped. He could not speak again. But he smiled, and a few seconds later Bell clenched his hands. Ortiz

was gone.

Someone touched his arm. Paula Canalejas. He stared down at her and managed to smile. It was not a very successful smile. He drew a deep breath.

"I would like," said Bell wryly, "to think that, when I die, I will die as well as this man did. But I'm afraid I shan't."

But Paula said:

"The airplane can be heard outside. It seems to be moving on the surface."

And ten minutes later the plane loomed up out of the mist, queerly ungainly on the surface of the water. Its motors roared impatiently as if held in leash. It swung clumsily about, heading off out of sight in the fog to turn. It came back, sliding along the top of the water with its wing-tip floats leaving alternate streaks of white foam behind them. A man stood up in its after cockpit.

Bell crowded to the rail. The man—goggled and masked—held up a package as if to fling it on board. Bell watched grimly. But he saw that the pilot checked himself and looked up at the upper deck. Bell craned his neck. The wireless operator was waving wildly to the seaplane. He writhed his hands, and held his hand to his head as if blowing out his brains, and waved the plane away, frantically.

The pilot of the plane sat down. A moment later its motors roared more thunderously. It is not safe to alight on either land or water when fog hangs low, but there is little danger in taking off.

The seaplane shot away into the mist, its motors bellowing. The sound of its going changed subtly. It seemed to rise, and grow more distant.... It died away.

Bell halted at the top of the companion-ladder and saw the wireless operator, with a crooked, nervous grin upon his face.

Chapter 3

Bell saw what he was looking for, out in the throng of traffic that filled the Avenida do Acre, in Rio. He'd seen it over the heads of the crowd, which was undersized, as most Brazilian crowds are, and he managed to get through the perpetual jam on the mosaic sidewalk and reach the curb.

He stood there and regarded the vehicles filling the broad avenue, wearing exactly the indifferent, half-amused air of a tourist with no place in particular to go and a great deal of time in which to go there. Taxis chuffed past, disputing right of way with private cars which were engaged in more disputes with other cars, all in the rather extraordinary bad temper and contentiousness which comes to the Latin-American when he takes the wheel of an automobile.

As if coming to an unimportant decision, Bell raised his hand to an approaching cab. It had two men on the chauffeur's seat. Of course. All taxis in Rio carry two men in front. One drives, and the other lights his cigarettes, makes witty comments upon passing

ladies, and helps in collecting the fares from recalcitrant passengers. The extra man is called the "secretary," and he assists materially in giving an impression of haughty pride.

The taxi ground to the curb. The secretary reached behind him indifferently and opened the door. Bell did not glance at him. He stepped inside and settled down languidly.

"The Beira Mar," he said listlessly.

The taxi started off with a jolt. It is the invariable custom in Rio de Janeiro. And besides, it reminds the passenger that he is merely a customer, admitted to the cab on sufferance, and that he must be suitably meek to those who will presently blandly ignore the amount registered by the meter and demand a fare of from eight to twenty-seven times the indicated amount.

The cab went shooting down the Avenida do Acre toward the harbor. The Avenida do Acre is officially the Avenida Rio Blanco, and it should be called by

that name, only people forget. The Beira Mar, however, is named with entire propriety. It is actually the edge of the sea, and it is probably one of the two or three most beautiful driveways in the world.

The cab whirled past the crowded sidewalks. Incredible numbers of people, with an incredible variation in the shades of their complexions, moved to and from with the peculiar aimlessness of a Brazilian crowd. A stout and pompous negro politician from Bahia, wearing an orchid in his button-hole, rubbed elbows with a striking blonde lady of the sidewalks on his left, and forced a wizened little silk-hatted *parda*—approximately an octoroon—to dodge about him in order to progress. A young and languid person, his clothes the very last expiring gasp of fashion, fingered his stick patiently. He wore the painstakingly cultivated expression of bored disillusionment your young Brazilian dandy considers aristocratic. It was very probable that he shared a particularly undesirable bedroom with four or five other young men in order to purchase such clothing, but then, *farenda fita*—making a picture—is the national

Brazilian sport.

Bell lighted a cigarette. It was not wise to regard the secretary of this particular taxi too closely, but if his face had been thickly smeared with coal dust, and if he had had a two weeks' beard, and if he had been seen on the forecastle of the *Almirante Gomez*, one would have deduced him to be a stoker who had not used the name of Jamison.

The cab reached the Beira Mar, and turned to take the long route about the bay. It is one of the most beautiful views to be found anywhere, and tall apartment houses have been built along its whole length to capitalize the scenery. True, the more brightly-colored ladies of the capital have established themselves in vast numbers among these apartment houses, but in their languid promenades they add—let us say—the beauties of art to those of nature.

A voice spoke from the chauffeur's seat.

"Bell."

"Right," said Bell without moving. His eyes flickered, however, and he found the device Jamison had inserted. A speaking-tube of sorts. Not especially efficient, but inconspicuous enough. He stirred listlessly and got his lips near it.

"All right to talk?" he asked briefly.

"Shoot," said Jamison from the secretary's seat beside the chauffeur. "This man doesn't understand English, and he thinks I'm in a smuggling gang. He expects to make some money out of me eventually."

Bell spoke curtly, while the taxi rolled past the Morro da Gloria with its quaint old church and went along the winding, really marvelous driveway past many beaches, with the incredibly blue water beyond.

"Canalejas is out of town," he said. "It isn't known when he'll be back. I met his daughter at a dance at our Embassy here, and she told me. We didn't dare to talk much, but she's frightened. Especially after what happened to Ortiz. And I've met Ribiera, whom Ortiz named."

"I've been looking him up," growled Jamison through the speaking-tube.

Bell flicked the ash from his cigarette out the door, and went on quietly.

"He's trying to get friendly with me. I've promised to call at his house and have him take me out to the flying field. He has two planes, he tells me, a big amphibian and a two-seater. Uses them for commuting between Rio and his place back inland. He went out of his way to cultivate me. I think he suspects I'm trying to find out something."

"Which you are," said Jamison dryly. "You've found out that Ortiz was right at least about—"

Bell nodded, and frowned at himself for having nodded. He spoke into the mouthpiece by his head with an expressionless face.

"He's practically fawned upon by a bunch of important officials and several high ranking army officers. Suspecting what I do, I think he's got hold of

a devil of a lot of power."

Jamison scowled in a lordly fashion upon a mere pedestrian who threatened to impede the movement of the taxicab by making it run over him.

"Ortiz," said Bell quietly, "told me he'd been poisoned, and treason asked as the price of the antidote. I've heard that the Brazilian Minister for Foreign Affairs went insane six months ago. I heard, also, that it was homicidal mania—murder madness. And I'm wondering if these people who fawn upon Ribiera aren't paying a price for—well—antidotes, or their equivalent. The Minister for Foreign Affairs may have refused."

"You're improving," said Jamison dryly. The taxi rounded a curve and a vista of sea and sand and royal palms spread out before it. "Yes, you're improving. But Ortiz spoke of Ribiera only as a deputy of The Master. Who is The Master?"

"God knows," said Bell. He stared languidly out of the window, for all the world to see. A tourist, regarding

the boasted beauties of the Biera Mar.

"A deputy," said Jamison without emotion, "of some unknown person called The Master poisoned Ortiz in Buenos Aires. And Ortiz was an important man in the Argentine. Ribiera is merely the deputy of that same unknown Master in Rio, and he has generals and state presidents and the big politicians paying court to him. If deputies in two countries that we know of have so much power, how much power has The Master?"

Silence. The taxi chugged steadily past unnoticed beauties and colorings. Rio is really one of the most beautiful cities in the world.

"It's like this," said Jamison jerkily. "Seven Service men vanish and one goes mad. You get two tips that the fate of Ortiz is the fate of the seven men—eight, in fact. We find that two men dispense a certain ghastly poison in two certain cities, at the orders of a man they call The Master. We find that those two men wield an astounding lot of power, and we know they're only deputies, only subordinates of the Master. We know, also, that the Service men vanished

all over the whole continent, not in just those two cities. How many deputies has The Master? What's it all about? He wanted treason of Ortiz, we know. What does he want of the other men his deputies have enslaved? Why did he poison the Service men? And why—especially why—do two honorable men, officials of two important nations, want to tip off the United States Government about the ghastly business? What's it got to do with our nation?"

Bell flung away his cigarette.

"That last question has occurred to me too," he observed, and carefully repressed a slight shiver. "I have made a guess, which is probably insane. I'm going to see Ribiera this afternoon."

"He already suspects you know too much," said Jamison without expression.

"I am"—Bell managed the ghost of a mirthless smile—"I am uncomfortably aware of it. And I may need an antidote as badly as Ortiz. If I do, and can't help myself, I'll depend on you."

Jamison growled.

"I simply mean," said Bell very quietly, "that I'd really rather not be—er—left alive if I'm mad. That's all. But Ortiz knew what was the matter with him before he got bad off. I know it's a risk. I'm goose-flesh all over. But somebody's got to take the risk. The guess I've made may be insane, but if it's right one or two lives will be cheap enough as a price for the information. Suppose you chaps turn around and take me to Ribiera's house?"

There was a long pause. Then Jamison spoke in Portuguese to his companion. The taxi checked, swerved, and began to retrace its route.

"You're a junior in the Trade," said Jamison painstakingly. "I can't order you to do it."

Bell fumbled with his cigarette case.

"The Trade doesn't exist, Jamison," he said dryly. "And besides, nobody gives orders in The Trade. There are only suggestions. Now shut up a while. I want to try

to remember some consular reports I read once, from the consul at Puerto Pachecho."

"What?"

"The consul there," said Bell, smiling faintly, "was an amateur botanist. He filled up his consular reports with accounts of native Indian medicinal plants and drugs, with copious notes and clinical observations. I had to reprove him severely for taking up space with such matters and not going fully into the exact number of hides, wet and dry, that passed through the markets in his district. His information will be entirely useless in this present emergency, but I'm going to try to remember as much of it as I can. Now shut up."

When the taxi swung off the Biera Mar to thread its way through many tree-lined streets—it is a misdemeanor, punishable by fine, to cut down a tree in Rio de Janeiro—it carried a young American with the air of an accomplished idler, who has been mildly bored by the incomparable view from the waterside boulevard. When it stopped at the foot of one of the slum covered *morros* that dot all Rio, and a liveried

doorman came out of a splendid residence to ask the visitor his name, the taxi discharged a young American who seemed to feel the heat, in spite of the swift motion of the cab. He wiped off his forehead with his handkerchief as he was assured that the Senhor Ribiera had given orders he was to be admitted, night or day. When the taxi drove off, it carried two men on the chauffeur's seat, of whom one had lost, temporarily, the manner of haughty insolence which is normally inseparable from the secretary of a taxicab chauffeur.

But though he wiped his forehead with his handkerchief, Bell actually felt rather cold when he followed his guide through ornately furnished rooms, which seemed innumerable, and was at last left to wait in an especially luxurious salon.

There was a pause. A rather long wait. A distinctly long wait. Bell lighted a cigarette and seemed to become mildly bored. He regarded a voluptuous small statuette with every appearance of pleased interest. A subtly decadent painting seemed to amuse him considerably. He did not seem to notice that no

windows at all were visible, and that shaded lamps lit this room, even in broad daylight.

Two servants came in, a footman in livery and the major-domo. Your average *Carioca* servant is either fawning or covertly insolent. These two were obsequious. The footman carried a tray with a bottle, glass, ice, and siphon.

"The Senhor Ribiera," announced the major-domo obsequiously, "begs that the Senhor Bell will oblige him by waiting for the shortest of moments until the Senhor Ribiera can relieve himself of a business matter. It will be but the shortest of moments."

Bell felt a little instinctive chill at sight of the bottle and glasses.

"Oh, very well," he said idly. "You may put the tray there."

The footman lifted the siphon expectantly. Bell regarded it indifferently. The wait before the arrival of this drink had been longer than would be required

merely for the announcing of a caller and the tending of a tray, especially if such a tray were a custom of the place. And the sending of a single bottle only, without inquiry into his preferences....

"No soda," said Bell. He poured out a drink into the tinier glass. He lifted it toward his lips, hesitated vaguely, and drew out his handkerchief again.

He sneezed explosively, and the drink spilled. He swore irritably, put down the glass, and plied his handkerchief vigorously. A moment later he was standing up and pouring the drink out afresh, from the bottle in one hand to the glass in the other. He up-tilted the glass.

"Get rid of this for me," he said annoyedly of the handkerchief.

He saw a nearly imperceptible glance pass between the footman and the major-domo. They retired, and Bell moved about the room exactly like a young man who has been discomfited by the necessity of sneezing before servants. Anywhere else in the world,

of course, such a pose would not have been convincing. But your Brazilian not only adopts *fazenda fita* as his own avocation, but also suspects it to be everybody else's too. And a young Brazilian of the leisure class would be horribly annoyed at being forced to so plebeian an exhibition in public.

He moved restlessly about the room, staring at the picture. Presently he blinked uncertainly and gazed about less definitely. He went rather uncertainly to the chair he had first occupied and sat down. He poured—or seemed to pour—another drink. Again he sneered, and looked mortified. He put down the glass with an air of finality. But he looked puzzledly about him. Then he sank back in his chair and gradually seemed to sink into a sort of apathetic indifference.

He looked, then, like a very bored young man on the verge of dozing off. But actually he was very much alert indeed. He had the feeling of eyes upon him for a while. Then that sensation ceased and he settled himself to wait. And meantime he felt a particular, peculiar gratitude to the late American consul at Puerto Pachecho for his interest in medicinal plants.

That gentleman had gone into the subject with the passionate enthusiasm of the amateur. He had described *icus*, *uirari* and *timbo*. He had particularized upon *makaka-nimbi* and *hervamoura*. And he had gone into a wealth of detail concerning *yagué*, on account of its probable value if used in criminology. As consul at Puerto Pachecho he was not altogether a success in some ways, but he had invented an entirely original method of experimentation upon those drugs and poisons which did not require to be introduced into the blood-stream. His method was simplicity itself. An alcoholic solution "carried" a minute quantity of the drug in its vapor, just as an alcoholic solution carries a minute quantity of perfuming essential oil. He inhaled the odor of the alcoholic solution. The effect was immediately, strictly temporary, and not dangerous. He was enabled to describe the odors, in some cases the tastes, and in a few instances the effects of the substances he listed, from personal experience.

And Bell had used his method as an unpromising but possible test for a drug in the drink that had been

brought him. He inhaled the strangling odor of the spilled liquor on his handkerchief. And there was a drug involved. For an instant he was dizzy, and for an instant he saw the room through a vivid blue haze. And something clicked in his brain and said "*It's yagué.*" And the relief of dealing with something which he knew—if only at second-hand—was so enormous that he felt almost weak.

Yagué, you see, is an extract from the leaves of a plant which is not yet included in *materia medica*. It has nearly the effect of scopolamine—once famous in connection with twilight sleep—and produces a daze of blue light, an intolerable sleepiness, and practically all the effects of hypnotism. A person under *yagué*, as under scopolamine or hypnosis, will seem to slumber and yet will obey any order, by whomever given. He will answer any question without reserve or any concealment. And on awakening he will remember nothing done under the influence of the potion. The effects are not particularly harmful.

Bell then, sat in an apparent half-daze, half-slumber, in the salon in which he waited for Ribiera to appear.

He knew exactly what he was expected to do. Ribiera wanted to find out what he knew or suspected about Ortiz's death. Ribiera wanted to know many things, and he would believe what Bell told him because he thought Bell had taken enough *yagué* to be practically an hypnotic subject. Let Ribiera believe what he was told!

When he came into the room, bland and smiling, Bell did not stir. He was literally crawling, inside, with an unspeakable repulsion to the man and the things for which he stood. But he seemed dazed and dull, and when Ribiera began to ask questions he babbled his answers in a toneless, flat voice. He babbled very satisfactorily, in Ribiera's view.

When Ribiera shook him roughly by the shoulder he started, and let his eyes clear. Ribiera was laughing heartily.

"Senhor! Senhor!" said Ribiera jovially. "My hospitality is at fault! You come to be my guest and I allow you to be so bored that you drop off to sleep! I was detained for five minutes and came in to find you

slumbering!"

Bell stared ruefully about him and rubbed his eyes.

"I did, for a fact," he admitted apologetically. "I'm sorry. Up late last night, and I was tired. I dropped in to see those planes you suggested I'd be interested in. But I daresay it's late, now."

Ribiera chuckled again. He was in his late and corpulent forties and was something of a dandy. If one were captious, one might object to the thickness of his lips. They suggested sensuality. And there was a shade—a bare shade—more of pigment in his skin than the American passes altogether unquestioned. And his hair was wavy.... But he could be a charming host.

"We'll have a drink," he said bluntly, "while the car's coming around to the door, and then go out to the flying field."

"No drink," said Bell, lifting his hand. "I feel squeamish now. I say! Haven't you changed the

lamps, or something? Everything looks blue...."

That was a lie. Things looked entirely normal to Bell. But he looked about him as if vaguely puzzled. If he had drunk the liquor Ribiera had sent him, things would have had a bluish tinge for some time after. But as it was....

Ribiera chaffed him jovially on the way to the flying field. And introducing him to fliers and officials of the field, he told with gusto of Bell's falling asleep while waiting for him. A very jolly companion, Ribiera.

But Bell saw two or three men looking at him very queerly. Almost sympathetically. And he noticed, a little later, that a surprising number of fliers and officials of the airport seemed to be concealing an abject terror of Ribiera. One or two of them seemed to hate him as well.

Chapter 4

Bell stepped out of a tall French window to a terrace, and from the terrace to the ground. There was a dull

muttering in the sky to the east, and a speck appeared, drew nearer swiftly, grew larger, and became a small army biplane. It descended steeply to earth behind a tall planting of trees. Bell lighted a cigarette and moved purposelessly down an elaborately formalized garden.

"More victims," he observed grimly to himself, of the plane.

Ribiera lifted a pigmented hand to wave languidly from a shaded chair. There were women about him, three of them, and it sickened Bell to see the frightened assiduity with which they flattered him. Bell had met them, of course. Madame the wife of the State President of Bahia—in the United States of Brazil the states have presidents instead of governors—preferred the title of "Madame" because it was more foreign and consequently more aristocratic than Senhora. And Madame the wife of the General—

"Senhor," called Ribiera blandly, "I have news for you."

Bell turned and went toward him with an air of pleased expectancy. He noticed for the first time the third of the women. Young, in the first flush of youthful maturity, but with an expression of stark terror lingering behind a palpably assumed animation.

"An acquaintance of yours, Senhor," said Ribiera, "is to be my guests."

Bell steeled himself.

"The Senhor Canalejas," said Ribiera, beaming, "and his daughter."

Bell seemed to frown, and then seemed to remember.

"Oh, yes," he said carelessly, "I met her in Washington. She was on the *Almirante Gomez*, coming down."

The next instant he saw Ribiera's expression, and cursed himself for a fool. Ribiera's eyes had narrowed sharply. Then they half-closed, and he smiled.

"She is charming," said Ribiera in drowsy contentment, "and I had thought you would be glad to improve her acquaintance. Especially since, as my friend, you may congratulate me. A contract of marriage is under discussion."

Bell felt every muscle grow taut. The fat, pigmented man before him....

"Indeed," said Bell politely, "I do congratulate you."

Ribiera looked at him with an expression in which a sardonic admiration mingled with something else less pleasant.

"You are clever, Senhor Bell," he said heavily, seeming to sink more deeply into his chair. "Very clever." He shifted his eyes to the women who stood about him. "You may go," he said indifferently. His tone was exactly that of a despot dismissing his slaves. Two of them colored with instinctive resentment. His eyes lingered an instant on the third. Her face had showed only a passionate relief. "You, Senhora," he said heavily, "may wait nearby."

The terror returned to her features, but she moved submissively to a spot a little out of earshot. Bell found his jaws clenched. There is a certain racial taint widespread in Brazil which leads to an intolerable arrogance when there is the slightest opportunity for its exercise. Ribiera had the taint, and Bell felt a sickening wrath at the terrified submission of the women.

"*Si*," said Ribiera, suddenly adverting to insolence. "You are clever, Senhor Bell. Where did you learn of *yagué*?"

Bell inhaled leisurely. His muscles were tense, but he gave no outward sign. Instead, he sat down comfortably upon the arm of a chair facing Ribiera's. The only way to meet insolence is with equal insolence and a greater calm.

"Ah!" said Bell pleasantly. "So you found out it didn't work, after all!"

Ribiera's eyes contracted. He became suddenly enraged.

"You are trifling with me," he said furiously. "Do you know the penalty for that?"

"Why, yes," said Bell, and smiled amiably. "A dose of—er—poison of The Master's private brand."

It was a guess, but based on a good deal of evidence. Ribiera turned crimson, then pale.

"What do you know?" he demanded in a deadly quietness. "You cannot leave this place. You are aware of that. The people here—guests and servants—are my slaves, the slaves of The Master. You cannot leave this place except also as my slave. I will have you bound and given *yagué* so that you cannot fail to tell me anything that I wish to know. I will have you tortured so that you will gladly say anything that I wish, in return for death. I will—"

"You will," said Bell dryly, "drop dead with seven bullets in your body if you give a signal for anyone to attack me."

Ribiera stared at him as his hand rested negligently in

his coat pocket. And then, quite suddenly Ribiera began to chuckle. His rage vanished. He laughed, a monstrous, gross, cackling laughter.

"You have been my guest for two days," he gasped, slapping his fat knees, "and you have not noticed that your pistol has been tampered with! Senhor Bell! Senhor Bell! My uncle will be disappointed in you!"

It seemed to impress him as a victory that Bell had been depending upon an utterly futile threat for safety. It restored his good humor marvelously.

"It does not matter," he said jovially. "Presently you will tell me all that I wish to know. More, perhaps. My uncle is pleased with you. You recall your little talk with the wireless operator on the *Almirante Gomez*? You tried to learn things from him, Senhor. He reported it. Of course. All our slaves report. He sent his report to my uncle, The Master, and I did not have it until to-day. I will admit that you deceived me. I knew you had talked with Ortiz, who was a fool. I thought that in his despair he might have spoken. I gave you *yagué*, as I thought, and informed my uncle

that you knew nothing. And he is very much pleased with you. It was clever to deceive me about the *yagué*. My uncle has high praise for you. He has told me that he desires your services."

Bell inhaled again. There was no question but that Ribiera was totally unafraid of the threat he had made. His gun must have been tampered with, the firing-pin filed off perhaps. So Bell said placidly:

"Well? He desires my services?"

Ribiera chuckled, in his gross and horrible good humor.

"He will have them. Senhor. He will have them. When you observe your hands writhing at the ends of your wrists, you will enter his service, through me. Of course. And he will reward you richly. Money, much money, such as I have. And slaves—such as I have. The Senhora...."

Ribiera looked at the terrified girl standing thirty or forty feet away. He chuckled again.

"My uncle desires that you should be induced to enter his service of your own will. So, Senhor, you shall see first what my uncle's service offers. And later, when you know what pleasures you may some day possess as my uncle's deputy in your own nation, why, then the fact that your hands are writhing at the ends of your wrists will be merely an added inducement to come to me. And I bear you no ill will for deceiving me. You may go."

Bell rose.

"And still," he said dryly, "I suspect that you are deceived. But now you deceive yourself."

He heard Ribiera chuckling as he walked away. He heard him call, amusedly, "Senhora." He heard the little gasp of terror with which the girl obeyed. He passed her, stumbling toward the gross fat man with the light brown skin and curly hair. Her eyes were literally pools of anguish.

Bell threw away his cigarette and began to fumble for another. He was beginning to feel the first twinges of

panic, and fought them down. Ribiera had not lied. Bell had been at this *fazenda* of his—which was almost a miniature Versailles three hundred miles from Rio—for two days. In all that time he had not seen one person besides himself who did not display the most abject terror of Ribiera. Ribiera had made no idle boast when he said that everyone about, guests and servants, were slaves. They were. Slaves of a terror vastly greater than mere fear of death. It—

"Senhor!... *Oh, Dios!*" It was the girl's voice, in despair.

Ribiera laughed. Bell felt a red mist come before his eyes.

He deliberately steadied his hands and lighted his cigarette. He heard stumbling footsteps coming behind him. A hand touched his arm. He turned to see the girl Ribiera had pointed out, her cheeks utterly, chalky white, trying desperately to smile.

"Senhor!" she gasped. "Smile at me! For the love of God, smile at me!"

In the fraction of a second, Bell was mad with rage. He understood, and he hated Ribiera with a corrosive hatred past conception. And then he was deathly calm, and wholly detached, and he smiled widely, and turned and looked at Ribiera, and Ribiera's whole gross bulk quivered as he chuckled. Bell took the girl's arm with an excessive politeness and managed—he never afterward understood how he managed it—to grin at Ribiera.

"Senhora," he said in a low tone, "I think I understand. Stop being afraid. We can fool him. Come and walk with me and talk. The idea is that he must think you are trying to fascinate me, is it not?"

She spoke through stiffened lips.

"Ah, that I could die!"

Bell had a horrible part to play while he walked the length of the formal garden with her, and found a pathway leading out of it, and led her out of sight. He stopped.

"Now," he said sharply, "tell me. I am not yet his slave. He has ordered you...."

She was staring before her with wide eyes that saw only despair.

"I—I am to persuade you to be my lover," she said dully, "or I shall know the full wrath of The Master...."

Bell asked questions, crisply, but as gently as he could.

"We are his slaves," she told him apathetically. "I and *mi Arturo*—my husband. Both of us...." She roused herself little under Bell's insistent questioning. "We were guests at his house at dinner. Our friends, people high in society and in the Republic, were all about us. We suspected nothing. We had heard nothing. But two weeks later Arturo became irritable. He said that he saw red spots before his eyes. I also. Then Arturo's hands writhed at the ends of his wrists. He could not control them. His nerves were horrible. And mine. And we—we have a tiny baby.... And Senhor Ribiera called upon my husband. He was

charming. He observed my husband's hands. He had a remedy, he said. He gave it to my husband. He became normal again. And then—my hands writhed. Senhor Ribiera told my husband that if he would bring me to him.... And I was relieved. We were grateful. We accepted the invitation of the Senhor Ribiera to this place. And he showed us a man, in chains. He—he went mad before our eyes. He was a member of the United States Secret Service.... And then the Senhor Ribiera told us that we faced the same fate if we did not serve him...."

Bell had thrust aside rage as useless, now. He was deliberately cold.

"And so?"

"It is a poison," she said unsteadily. "A deadly, a horrible poison which drives men murder mad in two weeks from the time of its administration. The Senhor Ribiera has an antidote for it. But mixed with the antidote, which acts at once, is more of the horrible poison, which will act in two weeks more. So that we are entrapped. If we disobey him...."

Bell began to smile slowly, and not at all mirthfully.

"I think," he said softly, "that I shall gain a great deal of pleasure from killing the Senhor Ribiera."

"*Dios—*" She strangled upon the word. "Do you not see, Senhor, that if he dies we—we—" She stopped and choked. "We—have a tiny baby, Senhor. We—we would...."

Again sick rage surged up in Bell. To kill Ribiera meant to drive his slaves mad, and mad in the most horrible fashion that can be imagined. To kill Ribiera meant to have these people duplicate the death of Ortiz, as their greatest hope, or to fill madhouses with snarling animals lusting to kill....

"It is—it is not only I, Senhor," said the girl before him. She was utterly listless, and in the agony of despair. "It is Arturo, also. The Senhor Ribiera has said that if I do not persuade you, that both Arturo and I.... And our little baby, Senhor!... Our families also will be entrapped some day. He has said so.... He will give that poison to our baby.... And it will grow up

either his slave, or—"

Her eyes were pools of panic.

"Oh, God!" said Bell very quietly. "And he's offering me this power! He's trying to persuade me to become like him. He's offering me pleasures!"

He laughed unpleasantly. And then he went sick with helplessness. He could kill Ribiera, perhaps, and let only God know how many people go mad. Perhaps. Or perhaps Ribiera would merely be supplanted by another man. Ortiz had said that he killed The Master's deputy in Buenos Aires, but that another man had taken his place. And the thing went on. And The Master desired a deputy in the United States....

"Somehow," said Bell very softly, "this has got to be stopped. Somehow. Right away. That devilish stuff! Can you get hold of a bit of the antidote?" he asked abruptly. "The merest drop of it?"

She shook her head.

"No, Senhor. It is given in food, in wine. One never knows that one has had it. It is tasteless, and we have only Senhor Ribiera's word that it has been given."

Bell's hands clenched.

"So devilish clever... What are we going to do?"

The girl stuffed the corner of her handkerchief into her mouth.

"I am thinking of my little baby," she said, choking. "I must persuade you, Senhor. I—I have been tearful. I—I am not attractive. I will try. If I am not attractive to you...."

Bell cursed, deeply and savagely. It seemed to be the only possible thing to do. And then he spoke coldly.

"Listen to me, Senhora. Ribiera talked frankly to me just now. He knows that so far I am not subdued. If I escape he cannot blame you. He cannot! And I am going to attempt it. If you will follow me...."

"There is no escape for me," she said dully, "and if he thinks that I knew of your escape and did not tell him...."

"Follow me," said Bell, smiling queerly. "I shall take care that he does not suspect it."

He gazed about for an instant, orienting himself. The plane that had just landed—the last of a dozen or more that had arrived in the past two days—had dipped down on the private landing field to the north.

There was a beautifully kept way running from the landing field to the house, and he went on through the thick shrubbery amid a labyrinth of paths, choosing the turnings most likely to lead him to it.

He came out upon it suddenly, and faced toward the field. There were two men coming toward the house, on foot. One was a flying pilot, still in his flying clothes. The other was a tall man, for a Brazilian, with the lucent clarity of complexion that bespeaks uncontaminated white descent. He was white-haired, and his face was queerly tired, as if he were

exhausted.

Bell looked sharply. He seemed to see a resemblance to someone he knew in the tall man. He spoke quickly to the girl beside him.

"Who is the man to the left?"

"Senhor Canalejas," said the girl drearily. "He is the Minister of War. I suppose he, too...."

Bell drew a deep breath. He walked on, confidently. As the two others drew near he said apologetically:

"Senhores."

They halted with the instinctive, at least surface, courtesy of the Brazilian. And Bell was fumbling with his handkerchief, rather nervously tying a knot in it. He held it out to Canalejas.

"Observe."

It was, of course, a recognition-knot such as may be

given to an outsider by one in the Trade. The tall man's face changed. And Bell swung swiftly and suddenly and very accurately to the point of the other man's jaw.

He collapsed.

"Senhor Canalejas," said Bell politely, "I am about to go and steal an airplane to take what I have learned to my companion for transmission. If you wish to go with me...."

Canalejas stared for the fraction of a second. Then he said quietly:

"But of course."

He turned to retrace his steps. Bell turned to the girl.

"If you are wise," he said gently, "you will go and give the alarm. If you are kind, you will delay it as much as you dare."

She regarded him in agonized doubt for a moment,

and nodded. She fled.

"Now," said Bell casually, "I think we had better hasten. And I hope, Senhor Canalejas, that you have a revolver. We will need one. Mine has been ruined."

Without a word, the white-haired man drew out a weapon and offered it to him.

"I had intended," he said very calmly, "to kill the Senhor Ribiera. His last demand is for my daughter."

They went swiftly. The plane Bell had seen alight some fifteen or twenty minutes before was just being approached by languid mechanics. It was, of course, still warm. Canalejas shouted and waved his arm imperiously. It is probable that he gave the impression of a man returning for some forgotten thing, left in the cockpit of the plane.

What happened then, happened quickly. A few crisp words in a low tone. A minor hubbub began suddenly back at the house. Canalejas climbed into the passenger's seat as if looking for something. And Bell

presented his now useless automatic pleasantly at the head of the nearest staring mechanic, and while he froze in horror, scrambled up into the pilot's cockpit.

"Contact!" he snapped, and turned on the switch. The mechanic remained frozen with fear. "Damnation!" said Bell savagely. "I don't know the Portuguese for 'Turn her over'!"

He fumbled desperately about in the cockpit. Something whirred. The propeller went over.... Canalejas shot with painstaking accuracy, twice. The motor caught with a spluttering roar.

As a horde of running figures, servants and guests, running with the same desperation, came plunging out on the flying field from the shrubbery. Bell gave the motor the gun. The fast little plane's tail came up off the ground as she darted forward. Faster and faster, with many bumpings. The bumpings ceased. She was clear.

And Bell zoomed suddenly to lift her over the racing, fear-ridden creatures who clutched desperately at the

wheels, and then the little ship shot ahead, barely cleared the trees to the east of the field, and began to roar at her topmost speed toward Rio.

Chapter 5

The Trade—which does not exist—has its obligations and its code, but also it has its redeeming features. When a man has finished his job, he has finished it. And as far as the Trade was concerned, Bell had but little more to do. But after that—and his eyes burned smokily in their depths—there was much that he intended to do. He sat in one of the *bondes* of the Botanical Garden half of the street railway system of Rio, and absent mindedly regarded the scenery. This particular *bonde* was headed out toward the Lagoa Rodrigo de Freitas, by which salty mass of water Bell would meet Paula Canalejas. He would receive a package from her, which he would deliver to Jamison. And then he would be free, and it was his private intention to engage in an enterprise which was very probably a form of suicide. But there are some things one cannot dismiss with a sage reflection that they are not one's business. This matter of Ribiera was

definitely one of them.

The escape from Ribiera's *fazenda* had been relatively easy, because so thoroughly unexpected. The little plane had climbed to five thousand feet and found a stratum of cloud that stretched for very many miles. Bell had emerged from it only twice in the first hour of flight, and the second time the sky was clear all about him. That he was pursued, he had no doubt. That Ribiera had wireless communications with Rio, he knew. And he knew that instant, and imperative orders would have gone out for his capture.

Rio would not be a healthy place for him. If Ribiera had power over high government officials, he had surely indirect power over the police, and a search for Bell would be in order at once. Yet Canalejas assuredly expected to return to Rio.

A shouted question with the motor cut out, and a nodded answer. Bell headed for Petropolis, which is Rio's only real summer resort and is high in the hills and only an hour and a half from it by train. It was surprisingly satisfactory to be handling a swift plane

again, and Bell allowed himself what he knew was about the only pleasure he was likely to have for some time to come.

Something of his hatred of Ribiera, however, came back as he prepared to land. He managed to crack the plane up very neatly, so that it would be of no use to Ribiera any more. And at the same time, of course, the cracking-up provided an excellent excuse for Canalejas to continue on by train.

They talked very briefly by the puffing engine.

"It is best," said Canalejas, "for you, Senhor, to remain here overnight. I believe Senhor Ribiera has given orders for us both to be looked for, yet as a Cabinet Minister I am still immune from arrest by the ordinary police. If I reach my home I shall be able to do all that is necessary."

"And you will prepare a message for me to carry," said Bell.

"It is ready," said Canalejas. He smiled faintly. "No,

Senhor. I have instructions to give my daughter. She will deliver the information to you to-morrow. Let me see. At the edge of the Lagoa Rodrigo de Freitas, at nine o'clock. She is the only messenger I can trust. I think that is all."

Bell hesitated uncomfortably.

"But you, sir," he said awkwardly. "You have been poisoned, as Senor Ortiz was."

"But certainly," said Canalejas. His smile was ironic as before. "But, unlike Senor Ortiz, I have no hope. I have arranged for my daughter to conceal herself and escape from Brazil. I have prepared for everything, Senhor. As you know, I had intended to kill Senhor Ribiera. In returning with you I have merely delayed my own death by a few hours."

Still smiling, and with the air of one entering a train for the most casual of journeys, Canalejas entered the coach.

And Bell, sitting in the *bonde* next morning, saw with

an uncanny clarity the one weak point in Ribiera's hold upon his subjects. When they had courage to fear nothing more than death, they could defy him. And not many could attain to that courage. But a few....

"I'll have some help, anyway," muttered Bell savagely to himself.

It is a long ride to the Botanical Gardens, from which one half the surface lines of Rio take their name. On the way out to the Lagao Rodrigo de Feitas, which, is close by the Garden itself, Bell had time to work over for the thousandth time the information he possessed, and realize its uselessness. Two things, only, might be of service. One was that Ribiera was the nephew of the person referred to as The Master, and yet was evidently as much subjected to him as his own victims to himself. The other was that the ultimate end of all the ghastly scheme was in some fashion political. If wealth alone had been Ribiera's aim, the gathering of his slaves would have had a different aspect. The majority of them would have been rich men, men of business, men who could pay out hundreds of

thousands a month in the desperate hope of being permitted to remain sane. There would not have been politicians and officials and officers of the army.

"The key men of the country," growled Bell inaudibly, "enslaved to Ribiera. They give him the power he's after more than cash. And it's those key men who have more to lose than money. There's such a thing as honor...."

Three times the conductor stopped beside him and suggestively rattled the coins in his box. Three times Bell absent mindedly paid the fare for the zone. But the ride is a long one, and he had had time to realize the hopelessness of any single-handed attack upon the thing he faced long before the end.

Then he absently moved through the amazing collection of tropic and near tropic growths that is the Botanical Garden until he came at once to Paula and the Lagoa Rodrico de Freitas.

It was alive with birds, and they hopped and pecked and squabbled without acrimony within feet of her

seated figure. Bell knew that she had been waiting for a long time. He looked quickly at her face. It was quite pale, but entirely tearless.

"Here is the message, Senhor Bell," she said quietly, "but I think I have been followed."

Bell growled in his throat.

"I did not discover it until I reached this spot," she said evenly. "And I did not know what to do. If I left, I would be seized and the message taken—and I think that someone would have waited here for you. So, in part to gain time, and in part because I hoped you might have some resource, I remained."

"How many of them?" asked Bell shortly.

"Two," she said quietly. She looked at him, her large eyes entirely calm and grave.

"Give me the package," said Bell briefly. "They'll be more anxious to get it back than to bother you. And I'll either knock them cold or hold them in a scrap

until you get away."

She reached in her pocket and handed him a small thick envelope. He stuffed it in the side pocket of his coat.

"I will walk away," he observed, "and they'll follow me. Can you arrange to give me some sign that you're safe?"

"By the gateway," she told him. "My handkerchief. I shall start as soon as you have vanished. If I am followed, I will drop this handkerchief, as it is. If I am not followed, I will tie a knot. But what can you do?"

"I'll do something," said Bell coldly. "Something!"

She smiled, with the same odd bitterness her father had shown.

"My father—shot himself," she said briefly. "I have no particular hope of doing better. But I shall not be Ribiera's slave."

She remained quite still. Bell moved away. He hurried. There was thick jungle ahead, a section of the Gardens that is painstakingly preserved untouched and undisturbed, that visitors to the capital of Brazil may observe a typical sample of the virgin interior. He dived into that jungle as if in flight.

And very shortly after, two men dived in after him. They hesitated, these men, because your policeman of Rio does not like to injure his uniform, and there are many thorns in jungle growths. But they entered it, having first drawn small glittering weapons. And then from the jungle came silence.

It seemed to be silence. But there may have been some small unusual noises. It would not be easy to tell if they were unusual or not, because there are peculiar flashes of charm in certain Brazilian institutions. The preservation of the spot of jungle itself is one. Another is the fact that in the Gardens all manner of wild things live at large and provide unexpected and delightful surprises to the usually foreign visitors.

So there were noises, after a bit. Such noises as some grunting wild thing might have made, perhaps. But they might also have been the gasping of a man as breath was choked out of him.... And there was a cracking sound a little later, which might—of course—have been any one of any number of accidental and perfectly natural causes. And it might have been a man upon whom another man had hurled himself, when the second man landed on his jaw. And thrashing noises a little later might have been anything.

But after what seemed a long time, Bell emerged. Alone. He was breathing quickly, and there were scratches on his face and hands which—well, which might have been made by thorns. He went swiftly back toward the spot where Paula had waited. He looked cautiously. She was gone.

And then Bell went leisurely, in the studious fashion of a person going through the Botanical Gardens because it was the thing to do, toward the gateway and the surface cars. As he neared the gate his eyes roved with apparent casualness all about. He saw a

tiny speck of white on the edge of the roadway. It looked as if it had been flung from a car. Bell picked it up. It was Paula's handkerchief, and there was no knot whatever in it. In fact, its lacy edge was torn.

"They've got her," said Bell, apparently unmoved.

He waited for a car. A bulky figure wearing thick spectacles came placidly from the Gardens. It waited, also, for the car. The car arrived, in its two sections of first and second class; the first reserved for *cavalhieros*, which is to say persons wearing coat, shirt, collar, necktie, hat, shoes and socks, and carrying no parcel larger than a brief case. Lesser folk who lacked any of the sartorial requirements for admission to the first class section, or wore *tomancos* instead of shoes, heaped themselves into the second section and paid one-third of the fare in the first.

Bell took his seat in the first section. It was comfortably filled. The bulky person with the thick spectacles wedged himself carefully into the space beside Bell. He unfolded a copy of the *Jornal do Commercio* and began to regard the advertisements.

Presently he found what he was looking for. "*O Bicho*," said medium-sized type. Beside it was a picture of a kangaroo. The gentleman with the thick spectacles resignedly fished into his pockets and found a lottery ticket. He tore it into scraps and threw them away. Then he began to gaze disinterestedly at the scenery and the other passengers in the car.

Bell drummed on his knee. With one's forefinger representing a dot, and one's second finger serving as a dash, it is surprising how naturally and absentmindedly one may convey a perfectly intelligible message to a man sitting within a reasonable distance. When the man is alongside, the matter is absurdly simple.

Presently the man with the thick lenses got out his paper again, as if bored by vistas such as no other city in the world can offer. His paper was in the pocket which pressed against Bell. If in getting out his newspaper he also abstracted a thick fat envelope from Bell's pocket and placed it in his own, and if all this took place under a sign—even in the section reserved for *cavalhieros* of approved raiment—

solemnly warning passengers against "*batadores de carteiras*," or pickpockets—well, it was an ironical coincidence whose humor Bell did not see.

He was busily tapping out on his knee the briefest possible account of what he had learned at Ribiera's *fazenda* up country.

"*One chance for me*," he tapped off at the end. "*If I can kidnap Ribiera I can make him talk. Somehow. He has big amphibian plane kept fueled and ready for long trip. I think he is back in Rio to direct hunt for me. Paula kidnapped. My job finished. On my own now.*"

The man with thick spectacles did not nod. He seemed to be looking idly at his paper, but it was folded at an article very discreetly phrased, beneath a photograph of Senhor Teixeira Canalejas, Minister of War, who had very unfortunately been found dead that morning. He had been depressed, of late, but there were certain circumstances which made it as yet impossible to determine whether he had killed himself or was the victim of an assassin.

"Getting set for me," tapped Bell grimly on his knee.
"Ribiera told me too much."

The man with thick spectacles yawned and turned the paper over. Under a smaller headline—which would only find a place on a Brazilian sheet—"A Regrettable Incident"—an item of more direct importance was printed. It told of an unnamed Senhor from the United States of the North America, who as the guest of a widely known Brazilian gentleman had behaved most boorishly, had stolen an airplane from his host and broken it to bits on landing unskilfully, and had vanished with priceless heirlooms belonging to his host. It read, virtuously:

No names are mentioned because the American Senhor has been widely introduced in Rio society as a person with an official status in Washington. It is understood that an inquiry is to be made of the Ambassador as to the status of the young man, before any action is taken by the police. It is to be expected, however, that he will at least be requested to leave the country.

Bell managed the barest flicker of a smile. Arrest, of course. Detention, most courteously arranged, while the Ambassador was communicated with. And Ribiera.

"*Give me dismiss,*" he tapped on his knee.

The gentleman in the thick spectacles ran his finger thoughtfully about the edge of his collar. In the Trade that is a signal of many varied meanings. A hand across the throat in any fashion means, "Clear out, your job is finished," "Save your skin as best you can," and "Get away without trying to help me," according to circumstances. In this case it relieved Bell of all future responsibility.

He yawned, tapping his lips with the back of his hand, signaled for a stop of the car, and got out. Five minutes later he had signaled a taxicab and given Ribiera's address. In six minutes he was being whirled toward the one house in all Rio de Janeiro from which his chance of a safe departure was slightest. In little more than half an hour he had dismissed the cab and was gazing placidly into the

startled eyes of the doorman. The doorman, like all of Rio where Ribiera was known and feared, knew that Bell was being hunted.

Bell handed over his card with an inscrutable air.

"The Senhor Ribiera," he said drily, "returned to the city last night. Present my card and say that I would like to speak to him."

The doorman ushered him inside and summoned the major-domo, still blinking his amazement. And the major-domo blinked again. But Bell followed with the air of an habitué, as he was again ushered into the luxurious salon in which he had once been offered a drugged drink.

Again he sank down in a softly padded chair and surveyed the pictures and the minor objects of decadent art about him. Again he lighted a cigarette with every appearance of ease, and again had the impression of eyes upon him. The major-domo appeared, somewhat agitated.

"The Senhor Ribiera," he said harshly, "will see you only if you are not armed. He requires your word of honor."

Bell smiled lazily.

"I'll do better than that," he said languidly. "I haven't had time to buy a revolver. But the automatic he had put out of commission is in my pocket. Present it to him with my compliments."

He handed over the weapon, butt first. The major-domo blinked, and took it. Bell sat down and smiled widely. He had been expected to be uproarious, to attempt to force the major-domo to lead him to Ribiera. And, of course, he would have been led past a perfectly planned ambush for his capture—but he might have killed the major-domo. Which would not disturb Ribiera, but had disturbed the servant.

Bell smoked comfortably. And suddenly hangings parted, and Ribiera came into the room. He smiled nervously, and then, as Bell blew a puff of smoke at him and nodded casually, he scowled.

"I came," said Bell deliberately, "to make a bargain. Frankly, I do not like to break my word. I was under obligations to deliver a package from Senhor Canalejas to a certain messenger who will take it to my government. I have done it. But I am not, Senhor Ribiera, a member of the Secret Service. I am entirely a free agent now, and I am prepared to consider your proposals, which I could not in honor do before."

He smiled pleasantly. Effrontery, properly managed, is one of the most valuable of all qualities. Especially in dealing with people who themselves are arrogant when they dare.

Ribiera purpled with rage, and then controlled it.

"Ah!" he rumbled. "You are prepared to consider my proposals. There are no proposals. The Master may be amused at your cleverness in escaping. I do not know. I do know that I am ordered to make you my slave and send you to The Master. That, I shall do."

"Perhaps," said Bell blandly: "but I can go without food and drink for several days, which will delay the

process. And while I cannot honorably tell you how to stop the man bearing Senhor Canalejas' package to my government, still ... If I willingly accepted a dose of *yagué* in token of my loyalty to The Master...."

Ribiera's good humor returned. He chuckled.

"You actually mean," he said jovially, "that you think you were given some of The Master's little compound, and that you wish to make terms before your hands begin to writhe at the ends of your wrists. Is not that your reason?"

Bell's eyes flickered. He had been horribly afraid of just that. But Ribiera's amusement was reassuring.

"Perhaps," said Bell. "Perhaps I am."

Ribiera sat down and stretched his fat legs in front of him. He surveyed Bell with an obscene, horrible amusement.

"Ah, Senhor," he chuckled, "some day we will laugh together over this! You yet hope, and do not yet know

how much better it will be for you if you cease to hope, and cultivate desires! The Master is pleased with you. You have just those qualities he knows are necessary in dealing with your nation. He is not angry with you. It is his intention to use you to extend his—ah—influence among the officials of your nation. You know, of course, that in but a little more time I will hold all Brazil—as I now hold this city—in the hollow of my hand. Four of the republics of this continent are already completely under the control of The Master's deputies, and of the rest, Brazil is not the most nearly subdued. A year or two, and The Master will become Emperor, and his deputies viceroys. And it is his whim to give you the opportunity of becoming the first deputy and the first viceroy of North America. And you come to me and offer—you, Senhor!—to make terms! I believe even The Master will laugh when he hears of it."

"But," said Bell practically, "do you accept my terms?"

Ribiera chuckled again.

"What are they, Senhor?"

"That you release the daughter of the Senhor Canalejas and pledge your word of honor that she will not be enslaved."

Ribiera's word of honor, of course, would be worth rather less than the breath that was used to give it. But his reception of the proposal would be informative.

He chuckled again.

"No, Senhor. I do not accept. But I will promise you as a favor, because my uncle The Master admires you, that within a few weeks you shall enjoy her charms. I do not," he added with amused candor, "find that any one woman diverts me for a very long time."

"Oh," said Bell, very quietly.

He sat still for an instant, and then shrugged, and looked about as if for an ash tray in which to knock the ashes from his cigarette. He stood up, carrying the tube of tobacco gingerly, and moved toward one by Ribiera's elbow. He knocked off the ash, and

crushed out the tiny coal. He fumbled in his pockets.

The next instant Ribiera choked with terror.

"Let me explain," said Bell softly. "I did not give your major-domo my word that I was unarmed. I merely gave him a weapon. I got these from two policemen who tried to arrest me an hour or so ago. And I also remind you, Senhor, that if the armed men you have posted to prevent my escape try to shoot me, that the inevitable contraction of my muscles will send two bullets into your heart—even if I am dead. I am a dead man, Senhor, if you give the word, but so are you if you give it."

Ribiera gasped. His eyes rolled in his head.

"Send for her," said Bell very gently. "Send for her, Senhor. I estimate that she has been in this house for less than half an hour. Have her brought here at once, and if she has been harmed the three of us will perish very promptly, and half of Rio will go mad after our death."

And the muzzles of two revolvers bored into the fat flesh of Ribiera's body, and a gasp that was almost a wail of terror came from the watchers—armed watchers—who dared not kill the man they had been posted to guard Ribiera against.

Ribiera lifted his hand and croaked an order.

In this room the electric lights were necessary at all times. And it occurred to Bell irrelevantly that perhaps there were no windows because there might be sometimes rather noisy scenes within these walls. And windows will convey the sound of screaming to the outside air, while solid walls will not.

He stood alert and grim, with his revolvers pressing into Ribiera's flabby flesh. His fingers were tensed upon the triggers. If he killed Ribiera, he would be killed. Of course. And men and women he had known and liked might be doomed to the most horrible of fates by Ribiera's death. Yet even the death or madness of many men was preferable to the success of the conspiracy in which Ribiera seemed to figure largely.

Ribiera looked up at him with the eyes of a terrified snake. There was a little stirring at the door.

"Your friends," said Bell softly, "had better not come close."

Ribiera gasped an order. The stirrings stopped. Paula came slowly into the room quite alone. She smiled queerly at Bell.

"I believed that you would come," she said quietly. "And yet I do not know that we can escape."

"We're going to try," said Bell grimly. To Ribiera he added curtly, "You'd better order the path cleared to the door, and have one of your cars brought around."

Ribiera croaked a repetition of the command.

"Now stand up—slowly," said Bell evenly. "Very slowly. I don't want to die, Ribiera, so I don't want to kill you. But I haven't much hope of escape, so I shan't hesitate very long about doing it. And I've got these guns' hammers trembling at full cock. If I get a bullet

through my head, they'll go off just the same and kill you."

Ribiera got up. Slowly. His face was a pasty gray.

"Your major-domo," Bell told him matter-of-factly, "will go before us and open every door on both sides of the way to the street. Paula"—he used her given name without thought, or without realizing it—"Paula will go and look into each door. If she as much as looks frightened, I fire, and try to fight the rest of the way clear. Understand? I'm going to get down to a boat I have ready in the harbor if I have to kill you and every living soul in the house!"

There was no boat in the harbor, naturally. But the major-domo moved hesitantly across the room, looking at his master for orders. For Ribiera to die meant death or madness to his slaves. The major-domo's face was ghastly with fear. He moved onward, and Bell heard the sound of doors being thrust wide. Once he gave a command in the staccato fashion of a terrified man. Bell nodded grimly.

"Now we'll move. Slowly, Ribiera! Always slowly.... Ah! That's better! Paula, you go on before and look into each room. I shall be sorry if any of your servants follow after you, Ribiera.... Through the doorway. Yes! All clear, Paula? I'm balancing the hammers very carefully, Ribiera. Very delicate work. It is fortunate for you that my nerves are rather steady. But really, I don't much care.... Still all clear before us, Paula? With the servants nerve-racked as they are, I believe we'll make it through, even if I do kill Ribiera. There'll be no particular point in killing us then. It won't help them. Don't stumble, please, Ribiera.... Go carefully, and very slowly...."

Ribiera's face was a gray mask of terror when they reached the door. A long, low car with two men on the chauffeur's seat was waiting.

"Only one man up front, Ribiera," said Bell dryly. "No ostentation, please. Now, I hope your servants haven't summoned the police, because they might want to stop me from marching you out there with a gun in the small of your back. And that would be deplorable, Ribiera. Quite deplorable."

With a glance, he ordered Paula into the tonneau. He followed her, driving Ribiera before him. There seemed to be none about but the stricken, terrified servant who had opened the door for their exit.

"My friend," Bell told the major-domo grimly, "I'll give you a bit of comfort. I'm not going to try to take the Senhor Ribiera away with me. Once I'm on board the yacht that waits for me, I'll release him so he can keep you poor devils sane until my Government has found a way to beat this devilish poison of his. Then I'll come back and kill him. Now you can tell the chauffeur to drive us to the Biera Mar."

He settled back in his seat. There were beads of perspiration on his forehead, but he could not wipe them off. He held the two revolvers against Ribiera's flabby body.

The car turned the corner, and he added dryly:

"Your servants, Ribiera, will warn your more prominent slaves of my intention of going on board a yacht. Preparations will be made to stop every

pleasure boat and search it for me. So ... tell your chauffeur to swing about and make for the flying field. And tell him to drive carefully, by the way. I've still got these guns on a very fine adjustment of the trigger-pressure."

Ribiera croaked the order. Bell was exactly savage enough to kill him if he did not escape.

For twenty minutes the car sped through the residential districts of Rio. The sun was high in the air, but clouds were banking up above the Pao d'Assucar—the Sugarloaf—and it looked as if there might be one of the sudden summer thunderstorms that sometimes sweep Rio.

Then the clear road to the flying field. Rio has the largest metropolitan district in the world, but a great deal of it is piled on end, and Rio itself built on most of the rest. The flying field is necessarily some miles from even the residential districts, for the sake of a level plain of sufficient area.

The car shot ahead through practically untouched

jungle, interspersed with tiny clearings in which were patchwork houses that might have been a thousand miles in the interior instead of so near the center of all civilization in Brazil. Up smooth gradients. Around beautifully engineered curves.

Bell put aside one revolver long enough to search Ribiera carefully. He found a pearl-handled automatic, and handed it to Paula.

"Worth having," he said cheerfully. "I wonder if you'd mind searching the chauffeur: with that gun at his head I think he'd be peaceful. You needn't have him stop."

Paula stood up, smiling a little.

"I did not think I lacked courage, Senhor," she observed, "but you have taught me more."

"*Nil desperandum*," said Bell lightly. He relaxed deliberately. Matters would be tense at the flying field, and he would need to be wholly calm. There was little danger of an attempt at rescue here, and the

necessity of being ready to shoot Ribiera at any instant was no longer a matter of split seconds.

He watched, while, bent over the back of the front seat, she extracted two squat weapons from the chauffeur's pockets.

"Quite an arsenal," said Bell as he pocketed them. He turned pleasantly to Ribiera. "Now, Ribiera, you understand just what I want. That big amphibian plane of yours is fairly fast, and once when I was merely your guest you assured me that it was always kept fueled and even provisioned for a long flight. When we reach the flying field I want it rolled out and warmed up, over at the other end of the field from the flying line. We'll go over to it in the car.

"And I've thought of something. It worried me, before, because sometimes if a man's shot he merely relaxes all over. So while we're at the flying field I'm going to be holding back the triggers of these guns with my thumbs. I don't have to pull the trigger at all—just let go and they'll go off. It isn't so fine an adjustment as I had just now, but it's safer for you as long as you

behave. And you might urge your chauffeur to be cautious. I do hope, Ribiera, that you won't look as if you were frightened. If there's any hitch, and delay for letting some fuel out of the tanks or messing up the motors, I'll be very sorry for you."

The car swooped out into bright sunshine. The flying field lay below, already in the shadow of the banking clouds above. Hangars lay stretched out across the level space.

Through the gates. Ribiera licked his lips. Bell jammed the revolver muzzles closer against his sides. The chauffeur halted the car. Paula spoke softly to him. He stiffened. Bell found it possible to smile faintly.

Ribiera gave orders. There was a moment's pause—the revolver muzzles went deeper into his side—and he snarled a repetition. The official cringed and moved swiftly.

"You have chosen your slaves well, Ribiera," said Bell coolly. "They seem to occupy all strategic positions.

We'll ride across."

The gears clashed. The car swerved forward and went deliberately across the wide clear space that was the flying field. It halted near the farther side. In minutes the door of a hangar swung wide. There was the sputtering of a not-yet-warmed-up motor. The big plane came slowly out, its motors coughing now and then. It swung clumsily across the field, turned in a wide circle, and stopped some forty or fifty feet from the car.

"Send the mechanic back, on foot," said Bell softly.

Again Ribiera found it expedient to snarl. And Bell added, gently, while the throttled-down motors of the big amphibian boomed on:

"Now get out of the car."

Tiny figures began to gaze curiously at them from the row of hangars. The mechanic, starting back on foot, the four people getting out of the car, the big plane waiting....

With his revolver ready and aimed at Ribiera's bulk, Bell reached in the front of the car and turned off the switch. The motor died abruptly. He put the key in his pocket.

"Just to get a minute or two extra start," he said dryly. "Climb up in the plane, Paula."

She obeyed, and turned at the top.

"I will cover them until you are up," she said quietly.

Bell laughed, now. A genuine laugh, for the first time in many days.

"We do work together!" he said cheerfully.

But he backed up the ladder. There was a stirring over by the hangars. The mechanic who had taxied the plane to this spot was a dwindling speck, no more than a third of the way across the field. But even from the distant hangars it could be seen that something was wrong.

"Close the door, Paula," said Bell. He had seated himself at the controls, and scanned the instruments closely.

This machine was heavy and large and massive. The boat-body between the retractable wheels added weight to the structure, and when Bell gave it the gun it seemed to pick up speed with an irritating slowness, and to roll and lurch very heavily when it did begin to approach flying speed. The run was long before the tail came up. It was longer before the joltings lessened and the plane began to rise slowly, with the solid steadiness that only a large and heavily loaded plane can compass.

Up, and up.... Bell was three hundred feet high when he crossed the hangars and saw tiny faces staring up at him. Some of the small figures were pointing across the field. The big plane circled widely, gaining altitude, and Bell gazed down. Ribiera was gesticulating wildly, pointing upward to the soaring thing, shaking his fist at it, and making imperious, frantic motions of command.

Bell took one quick glance all about the horizon. Toward the sea the sun shone down brilliantly upon the city. Inland a broad white wall of advancing rain moved toward the coastline. And Bell smiled frostily, and flung the big ship into a dive and swooped down upon Ribiera as a hawk might swoop at a chicken.

Ribiera saw the monster thing bearing down savagely, its motors bellowing, its nose pointed directly at him. And there is absolutely nothing more terrifying upon the earth than to see a plane diving upon you with deadly intent. A panic that throws back to non-human ancestors seizes upon a man. He feels the paralysis of those ancient anthropoids who were preyed upon by dying races of winged monsters in the past. That racial, atavistic terror seizes upon him.

Bell laughed, though it sounded more like a bark, as Ribiera flung himself to the ground and screamed hoarsely when the plane seemed about to pounce upon him. The shrill timbre of the shriek cut through the roaring of the motors, even through the thick padding of the big plane's cabin walls that reduced that roaring to a not intolerable growl.

But the plane passed ten feet or more above his head. It rose, and climbed steeply, and passed again above the now buzzing, agitated hangars, and climbed above the hills behind the flying field as some men went running and others moved by swifter means toward the shaken, nerve-racked Ribiera, on whose lips were flecks of foam.

Bell looked far below and far behind him. The incredible greenness of tropic verdure, of the jungle which rings Rio all about. The many glitterings of sunlight upon glass, and upon the polished domes of sundry public buildings, and the multitudinous shimmerings of the tropic sun upon the bay. The deep dark shadow of the banking clouds drew a sharp line across the earth, and deep in that shadow lay the flying field, growing small and distant as the plane flew on. But specks raced across the wide expanse. In a peculiar, irrational fashion those specks darted toward a nearly invisible speck, and encountered other specks darting away from that nearly invisible speck, and gradually all the specks were turned about and racing for the angular, toy-block squares which

were the hangars of the aeroplanes of the city of Rio de Janeiro.

Little white things appeared from those hangars—planes being thrust out into the open air while motes of men raced agitatedly about them. One of them was suddenly in motion. It moved slowly and clumsily across the ground, and then abruptly moved more swiftly. It seemed to float upward and to swing about in mid-air. It came floating toward the amphibian, though apparently nearly stationary against the sky. Another moved jerkily, and another....

Just before the big plane dived into the wide white wall of falling water, the air behind it seemed to swarm with aircraft.

In the cabin of the amphibian, of course, the bellowing of the motors outside was muffled to a certain degree. Paula clung to the seats and moved awkwardly up to the place beside Bell. She had just managed to seat herself when the falling sheet of water obliterated all the world.

"Strap yourself in your seat," he said in her ear above the persistent tumult without. "Then you might adjust my safety-belt. We'll be flying blind in this rain. I hope the propellers hold."

She fumbled, first at the belt beside his upholstered chair, and only afterward adjusted her own. He sent a quick glance at her.

"Shouldn't have done that," he said quietly. "I can manage somehow."

The plane lurched and tumbled wildly. He kicked rudder and jerked on the stick, watching the instrument board closely. In moments the wild gyrations ceased.

"The beginning of this," he said evenly, "is going to be hectic. There'll be lightning soon."

Almost on his words the gray mist out the cabin windows seemed to flame. There was thunder even above the motors. But the faint, perceptible trembling of the whole plane under the impulse of its engines

kept on. Bell kept his eyes on the bank and turn indicator, glancing now and then at the altimeter.

"We've got to climb," he said shortly, "up where the lightning is, too. We want to pass the Serra da Carioca with room to spare, or we'll crash on it."

There was no noticeable change in the progress of the plane, of course. Rain was dashing against the windows of the cabin with an incredible velocity. Rain at a hundred miles an hour acts more like hail than water, anyhow, and Bell was trusting grimly to the hope that the propellers were of steel, which will withstand even hail, and a hope that the blast through the engine cowlings would keep the wiring free of water-made short circuits.

But the air was bad beyond belief. At times the plane spun like thistledown in a vast and venomous flood that crashed into the windows with a vicious rattling. Lightning began and grew fiercer. It seemed at times as if the plane were whirling crazily in sheer incandescent flame. The swift air-currents at the beginning of a tropic thunderstorm were here

multiplied in trickiness and velocity by the hills of the Serra da Carioca, and Bell was flying blind as well. The safety-belts were needed fifty times within twenty minutes, as the big ship was flung about by fierce blasts that sometimes blew even the rain upward for a time. And over all, as the amphibian spun madly, and toppled crazily and fought for height, there was the terrific, incessant crashing of thunder which was horribly close, and the crackling flares of lightning all about.

"I'm going to take a chance," said Bell curtly above the uproar, with the windows seeming to look out upon the fires of hell. "I think we're high enough. The compass has gone crazy, but I'm going to risk it."

Again there was no perceptible alteration in the motion of the ship, but he fought it steadily toward the west. And it seemed that he actually was passing beyond the first fierce fringe of the storm, because the lightning became—well, not less frequent, but less continuous.

And suddenly, in a blinding flare of light that made

every separate raindrop look like a speck of molten metal, he saw another airplane. It was close. Breathtakingly close. It came diving down out of nowhere and passed less than twenty yards before the nose of the amphibian. It glistened with wet, and glittered unbearably in the incredible brightness of the lightning. Every spot and speck and detail showed with an almost ghastly distinctness. But it dived on past, its pilot rigid and tense and unseeing, plunging like a meteor straight downward. The golden, iridescent mist of rain closed over its body. And it was gone.

Ten minutes later Bell was driving onward through a gray obscurity, which now was no more than tinted pink by receding lightning-flashes. The air was still uneven and treacherous. The big plane hurtled downward hundreds of feet in wild descending gusts among the hills, and was then flung upward on invisible billows of air for other hundreds of feet. But it was less uncontrollable. There were periods of minutes when the safety-belts did not come into use.

And later still, half an hour perhaps, the steadiness of

the air gave assurance that the plane was past the range of the Serra da Carioca and was headed inland. He drove on, watching his instruments and flying blind, but with a gathering confidence in an ultimate escape from the swarm of aircraft Ribiera had sent aloft in the teeth of the storm to hunt for him. The motors hummed outside the padded cabin. The girl beside him was very quiet and very still and very pale.

"We want to get out of this before long," he said in her ear, "and then we can find out where we are, and especially begin to make some plans for ourselves."

Her eyes turned to him. There was a curious stiffness in her manner. It might have seemed reserve, but Bell recognized the symptoms of a woman whose self-control is hanging by a thread. He smiled.

"Hold on a while yet," he said gently. "I know you want to cry. But please hold on a while yet. When we reach friends...."

Her hands went to her throat, and he could feel the effort of will that kept her voice steady.

"Friends? We have no friends." She managed a smile. "The Senhor Ribiera explained to me when I arrived at his house how it was that no questions would be asked about my disappearance. My father is dead. The newspapers this morning said that it was not known whether he killed himself or was assassinated. The Senhor Ribiera has given orders to his slaves. The newspapers of this afternoon will inform a horrified world that you and I, together, murdered my father that we might flee together with such of his riches as he had actually gathered together for me to take away. We are murderers, my friend. Cables and telegraph wires are reporting the news. The daughter of the Minister of War of the Republic of Brazil was assisted by her lover to murder her father. She has fled with him. Now—where are we still to find friends?"

Bell stared, for the fraction of an instant. One thought came to him, and was checked. The Trade does not exist, anywhere. The Trade would not help. And murderers are always duly handed over when the Government of the United States is requested politely

to do so by another nation. Always. And so far as the whole civilized world was concerned they were murderers. Even the employees of the flying field who were not subject to The Master would swear to the strictly accurate story of their escape together.

"It is just scandalous enough and horrible enough," said Bell quietly, "to be reprinted everywhere as news. You're right. We haven't any friends. We're up against it. And so I think we'll have to hunt down and kill The Master. Then we'll be believed. And there are just two of us, with what weapons we have in our pockets, to attack. How many thousands of slaves do you suppose The Master has by now?"

And, quite suddenly, he laughed.

Chapter 7

The sun was sinking slowly when the plane appeared above the valley. There was only jungle below. Jungle, and the languid river which now flowed sluggishly into a wide and shallow pool in which drowned trees formed a mass of substance neither land nor marsh

nor river. The river now contracted to a narrow space and showed signs of haste, and even foaming water, and then again flowed placidly onward, sometimes even a hundred yards in breadth. Shadows of the mountains to the west were creeping toward the opposite hill-flanks, darkening the thick foliage and sending flocks of flying things home to their chosen roosts.

The sound of the plane was a buzzing noise, which grew louder to a sharp drone as it seemed to increase in size, and became a dull monotonous roar as it dipped toward the waters of the stream. It floated downward, very gently, and circled as if regarding a certain spot critically, and resumed its onward flight. Again it circled, anxiously, now, as if the time for alighting were short.

It seemed to hesitate in mid-air, and dived, and circled up-stream and came down the valley again. It sank, and sank, lower and lower, until the white of its upper wings was hidden by the tall trees on either side.

A *jabiru* stork saw it from downstream, solemnly squatting on four eggs which eventually would perpetuate the race. The *jabiru* was about forty feet above the water and had a clear view of the stream. The stork squatted meditatively, with its long, naked neck projecting above the edge of its nest.

The plane dipped ever lower, its reflection vivid and complete upon the waveless stream below it. Ten feet above the water. Five—and swift ripples from the rush of air disturbed the unbroken reflections behind. It was almost a silhouette against the mirrored appearance of the sunset sky. And then a clumsy-seeming boat body touched water with a vast hissing sound, and settled more and more heavily, while the speed of the plane checked markedly and its motors roared on senselessly.

Then, abruptly, the plane checked and partly swung around. The *jabiru* half-rose from its eggs. The motors were bellowing wildly again. As if tearing itself free, the plane sheered off from some invisible obstacle, one of its wing tip floats splashed water wildly, and, with the motors thundering at their fullest speed, it

went toward the shore with a dragging wing, like some wounded bird.

It beached, and the *jabiru* heard a sudden dense silence fall. A man climbed out of the boatlike body. He walked to the bow and dropped to the shore. He peered under the upward slanting nose of the boat-thing. The *jabiru*, listening intently, heard words.

Then, quite suddenly and quite abruptly, and generally with the unostentatious efficiency with which Nature manages such things in the tropics, night fell. It was dark within minutes.

The noise of Bell's scrambling back onto the deck of the amphibian's hull could be heard inside the cabin. He opened the door and slipped down inside.

"There ought to be some lights," he said curtly.

"Ribiera did himself rather well, as a rule."

He struck a match. Paula's eyes shone in the match-flame, fixed upon his face. He looked about, frowning. He found a switch and pressed it, and a dome-light

came into being. The cabin of the plane, from a place of darkness comparable to that of the jungle all about, became suddenly a cosy and comfortable place.

"Well?" said Paula quietly.

Bell hesitated, and took a deep breath.

"We're stuck," he said wryly. "We must have struck a snag or perhaps a rock, just under water. Half the bottom of the hull's torn out. There's no hope of repair. If I hadn't given her the gun and beached her, we'd have sunk in mid-stream."

Paula said nothing.

"Things are piling on us," said Bell grimly. "In the morning I'll try to make a raft. We can't stay here indefinitely. I'll hunt for maps and we'll try to plan something out. But I'll admit that this business worries me—the plane being smashed."

He passed his hand harassedly over his forehead. To have escaped from Rio was something, but since

Paula had told him Ribiera's plans, it was clearly but the most temporary of successes. Cabinet ministers are not so commonplace but that the scandalous and horrifying crime that was imputed to Bell and Paula would be printed in every foreign country.

Newspapers in Tokio would include the supposed murder in their foreign news, and in Bucharest and even Constantinople it would merit a paragraph or two. Assuredly every South American country would discuss the matter editorially, even where The Master's deputies did not order it published far and wide. There would be pictures of Bell and of Paula, labeled with an infamy. In every town of all Brazil their faces would be known, and those who were The Master's slaves would hunt them desperately, and all honorable men would seek them for a crime. Even in America there would be no safety for them. The Trade does not exist, officially, and a member of the Trade must get out of trouble as he can. As an accused murderer, Bell would be arrested anywhere. As worse than a mere murderess, Paula....

She was watching his face.

"This morning," she said queerly, "you—you quoted '*Nil desperandum*.'"

Bell ground his teeth, and then managed to smile.

"If I looked like I needed you say that," he said coolly, "I deserve to be kicked. Let's look for something to eat, and count up our resources. The thing to do is, when you fall down—bounce!"

He managed a nearly genuine grin, then, and to his intense amazement, she sobbed suddenly and bent her head down and began to weep. He stared at her in stupefaction for an instant, then swore at himself for a fool. Her father....

Half an hour later he roused her as gently as he could. It was helplessness, as much as anything else, that had made him leave her alone; but a woman needs to weep now and then. And Paula assuredly had excuse.

"Here's a cup of coffee," he said practically, "which you must drink. You can't have had anything to eat all

day. Have you?"

That question had haunted him too. She had been a prisoner in Ribiera's house for half an hour, possibly more. And Ribiera had in his possession, and used, a deadly, devilish poison from some unknown noxious plant. Its victim took the poison unknowingly, in a morsel of food or a glass of water or of wine. And for two weeks there was no sign of evil. And then the poison drove its victim swiftly mad—unless the antidote was obtained from Ribiera. And Ribiera administered the antidote with a further dose of poison.

If Paula had eaten one scrap of food or drunk one drop of water while Ribiera's captive....

She understood. She looked up suddenly, and read the awful anxiety in his eyes.

"No. Nothing." She caught her breath and steadied herself with an effort of the will. "I understand. You tried not to let me fear. But I ate nothing, touched nothing. I have not that to fear, at least."

"Drink this coffee," said Bell, smiling. "Ribiera was a luxurious devil. There's canned stuff and so on in a locker. He was prepared for a forced landing anywhere. Flares and rockets will do us no good, but there are a pair of machetes and a sporting rifle with shells. We don't need to die for a bit, anyhow."

Paula obediently took the coffee. He watched her anxiously as she drank.

"Now some soup," he urged, "and the rest of this condensed stuff. And I've found some maps and there's a radio receiving outfit if—"

Paula managed to smile.

"You want to know," she said, "if I can endure listening to it. Yes. I—I should not have given way just now. But I can endure anything."

Bell still hesitated, regarding her soberly.

"I've heard," he said awkwardly, "that in Brazil the conventions...."

She waited, looking at him with her large eyes.

"I hoped," said Bell, still more unhappily, "to find this place Moradores, where you said you had some relatives. I hoped to find it before dark. But before I landed I knew I'd missed it and couldn't hope to locate it to-night. I thought—"

"You thought," said Paula, smiling suddenly, "that my reputation would be jeopardized. And you were about to offer—"

Bell winced.

"Of course I don't mean to act like an ass," he said apologetically, "but some people...."

"You forget," said Paula, with the same faint smile, "what the newspapers will say of us, Senhor. You forget what news of us the cables have carried about the world. I think that we had better forget about the conventions. As the daughter of a Brazilian, that remark is heresy. But did you know that my mother came from Maryland?"

"Thank God!" said Bell relievedly. "Then you can believe that I'm not thinking exclusively of you, and maybe we'll get somewhere."

Paula put out her hand. He grasped it firmly.

"Right!" he said, more cheerfully than ever before. "Now we'll turn on the radio and see what news we get."

Into the deep dark jungle night, then, a strange incongruity was thrust. Tall trees loomed up toward the stars. A nameless little stream flowed placidly through the night and, beached where impenetrable undergrowth crowded to the water's edge, a big amphibian plane lay slightly askew, while a light glowed brightly in its cabin. More, from that cabin there presently emerged the incredible sound of music, played in Rio for *os gentes* of the distinctly upper strata of society by a bored but beautifully trained orchestra.

The *jabiru* stork heard it, and craned its featherless neck to stare downward through beady eyes. But it

was not frightened. Presently, instead of music, there was a man's voice booming in the disconnected sounds of human speech. And still the *jabiru* was unalarmed. Like most of the birds whose necks are bald, the *jabiru* is a useful scavenger, and so is tolerated in the haunts of men. And if man's gratitude is not enough for safety, the *jabiru* smells very, very badly, and no man hunts his tribe.

Bell had been listening impatiently, when a sudden whining, whistling noise broke into the program of very elevated music, played utterly without rest. The sound came from the speaker, of course.

He frowned thoughtfully. The whistling changed in timbre and became flutelike, then changed again, nearly to its original pitch and tone.

Paula was not listening. Her mind seemed very far away, and on subjects the reverse of pleasurable.

"Listen!" said Bell suddenly. "You hear that whistle? It came on all at once!"

Paula waited. The whistling noise went on. It was vaguely discordant, and it was monotonous, and it was more than a little irritating. Again it changed timbre, going up to the shrillest of squealings, and back nearly to its original sound an instant later.

Bell began to paw over maps. The plane had been intended for flight over the vast distances of Brazil, and there was a small supply of condensed food and a sporting rifle and shells included in its equipment. Emergency landing fields are not exactly common in the back country of South America.

"Here," said Bell sharply. "Here is where we are. It must be where we are! No towns of any size nearby. No railroad. No boat route. Nothing! Nothing but jungle shown here!"

He frowned absorbedly over the problem.

"What is it?" asked Paula.

"Someone near," said Bell briefly. "That's another radio receiver, an old fashioned regenerative set,

sensitive enough and reliable enough, but a nuisance to everyone but its owner—except when it's a godsend, as it is to us."

The music ended, and a voice announced in laboriously classic Portuguese, with only a trace of the guttural tonation of the *carioca*, that the most important news items of the day would be given.

Paula paled a little, but listened without stirring. The voice read—the rustling of sheets of paper was abnormally loud—a bit of foreign news, and a bit of local news, and then....

She was deathly pale when the announcement of her father's death was finished, and she had heard the official view of the police reported—exactly what Ribiera had told her it would be. When the voice added that a friend of the late Minister of War, the Senhor Ribiera, had offered twenty contos for the capture of the fugitive pair, who had escaped in an airplane stolen from him, she bit her lip until it almost bled.

"I know," he said abstractedly. "It's as you said. But listen to that whistle."

The news announcement ceased. Music began again. The whistling abruptly died away.

"I just found some coils," said Bell feverishly, "that plug in to take the place of the longer-wave ones. I'm going to try them. It's a hunch, and it's crazy, but...."

There were sharp clickings. The radio receiver was one of those extraordinarily light and portable ones that are made for aircraft. In seconds it was transformed into a short-wave receiver. Bell began to manipulate the dials feverishly. Two minutes. Three. Four.

The speaker suddenly began to whine softly and monotonously.

"Regeneration," said Bell feverishly, "on a carrier-wave. It can't be far off, that receiving set."

Suddenly a voice spoke. It was blurred and guttural.

Infinitely delicate adjustments cleared it up. And then....

Bell listened eagerly, at first in triumph, then in amazement, and at last in a grim satisfaction. Reports from Rio on a short-wave band of radio frequencies were passing from Ribiera to some other place apparently inland. It was Ribiera's own voice, which quivered with rage as he reported Bell's escape.

"I do not think," he snapped in Portuguese, "that full details should be spoken even on beam wireless. I shall come to the fazenda to-morrow and communicate with The Master direct. In the meantime I have warned all sub-deputies in Brazil. I urge that all deputies be informed and instructed as The Master may direct."

Another voice replied that The Master would be informed. In the meantime the deputy for Brazil was notified.

This list of bits of information chilled Bell's blood. This man, of Venezuela, had been denied the grace of

The Master by the deputy in Caracas. He would probably use the passwords and demand the grace of The Master of sub-deputies in the State of Pará. To be seized and Caracas informed. The deputy in Colombia desired that the son of Colonel García—upon a hunting-party with friends in the Amazon basin—should be attached to the service of The Master. His father had been so attached, and it was believed had smuggled a letter into the foreign mail warning his son. If possible, that letter should be intercepted. And from Paraguay the deputy requested that the family of Senor Gomez, visiting relatives in Rio, should be induced to regard the service of The Master as desirable....

The orders ceased abruptly. Ribiera acknowledged them. The whining whistle cut off. And Bell turned to Paula very grimly indeed.

"Pretty, isn't it?" he asked in a vast calmness.

"Apparently every nation on the continent has some devil like Ribiera in charge of the administration of this fiendish poison. Every republic has some fiend at work in it. And they're organized. My God! They're

organized! The Master seems to supply them with the mixture of poison and its antidote, and they report to him...."

Paula nodded.

"That was what my father had written down for you," she said quietly. "Any man who can be lured to eat or drink anything these men have prepared is lost. He gains no pleasure, as a drug might give. He is entrapped into a lifetime of awful fear, knowing that a moment's disobedience, a moment's reluctance to obey whatever command they give, will cause his madness."

"I'm trying to think what we can work out of this," said Bell shortly. "Some things are clear. There's a radio receiving set nearby, which listened to those short-wave reports. Within five or six miles, at most. We're going to find that to-morrow. And there's a central point, a *fazenda*, where one may talk direct with The Master, whoever and wherever he may be. And—judging by Ribiera—my guess is that The Master has the same hold upon them that they have

on their underlings. Ribiera is too arrogant a scoundrel to make obsequious reports if he were not afraid to omit them." He was silent for a moment, thinking. Then he said abruptly, "Try to get some sleep, if you can. That pistol of Ribiera's—you have it handy? Keep it where you can reach it in the dark. I'm going to watch, though."

Paula settled herself comfortably, and looked queerly across the dimly lit little cabin at him.

"My friend," she said with the faintest of quavering smiles, "Please do not reassure me. I have the courage of endurance, at least. And—I do not fear you."

It seemed to Bell, listening in the darkness that fell when he turned off the switch, that she stayed awake for a long time. But when she did sleep, she slept heavily.

Bell had a raft of canes afloat beside the amphibian when she waked. He was sweat-streaked and bitten by many insects. He was tired, and his clothes were

rag. But the raft was nearly twenty feet long, it would easily float two persons and what small supplies the plane carried, and it could be handled by a long pole.

"Hullo," he said cheerfully when she climbed on top of the waterlogged hull of the plane. "We're nearly ready to start off. I'm sorry I can't advise you to try to refresh yourself in the river. There are some fish in it that are fiends. One of them took a slice out of the side of my hand."

"*Piranhas!*" she exclaimed, and was pale. "You should have known!"

Piranhas are small fresh-water fish of the Brazilian rivers, never more than a foot and a half long, which prove the existence of a devil. Where they swarm in schools they will tear every morsel of flesh from a swimmer's body as he struggles to reach shore, and leave a clean-stripped skeleton of a mule or horse if an animal should essay to swim a stream.

"I'll ask, next time," said Bell ruefully. "I'd planned a

swim. But if you'll fix some coffee while I finish up this raft, we'll get going. I don't think we're far from some place or other. I heard what sounded suspiciously like a motor boat, about dawn."

She looked at him anxiously.

"Of course," said Bell, smiling, "if the boat belonged to whoever listened in on the Rio broadcast *and* the short-wave news, he won't be especially friendly, though he should be glad to see us. But I've been studying the map, and I have a rather hopeful idea. Let's have coffee."

He grinned as long as she was in sight, and when he went into the cabin of the plane he seemed more cheerful still. But the idea of floating down this nameless little jungle stream upon a raft of canes was not one that he would have chosen. It was forced upon him. To travel through the jungle itself was next to impossible with a girl, especially as they were dressed for city streets and not at all for battling with dense and thorn-studded undergrowth. And to stay with the plane was obviously absurd. Sooner or later

they had to abandon it, though the moment they did desert it they would be encountering not only the impersonal menace of the jungle, but the actual enmity of all the human race. The raft was the only possibility.

It floated smoothly enough when they started off, with Bell working inexpertly with his long pole to keep it in mid-stream. He was, of course, acutely apprehensive. In country like this a rapid could be expected anywhere. The jungle life loomed high above their heads on either side, and the life of the jungle went on undisturbed by their passage. Monkeys gaped at them and exchanged undoubtedly witty comments upon their appearance. Birds flew overhead with raucous and unpleasant cries. Toucans, in particular, made a most discordant din. Once they disturbed a tiny herd of peccaries, drinking, which regarded them pugnaciously and trotted sturdily out of sight as they came abreast.

But for one mile, for two, the stream flowed smoothly. A third.... And Paula pointed ahead in silence. A dug-out projected partly from the shoreline. Bell wielded

his long pole cautiously now, and drew closer and ever closer to the stream bank. Paula pointed again. There was even a small dock—luxury unthinkable in these wilds.

The raft touched bottom. And suddenly from somewhere out of sight there came a horrible and a bestial sound. It was a scream of blood-lust, of madness, of overpowering and unspeakable rage. Following it came cackling laughter.

Paula went white.

"The *fazenda*," said Bell softly, "of the sub-deputy who was listening in on Ribiera last night. And it sounds as if someone were very much amused. Some poor devil...."

Paula shuddered.

"I'm going ashore," said Bell, smiling frostily. "There's nothing else to do."

Chapter 8

Crouched at the edge of the jungle, where the clearing began, Paula heard four shots. Two in quick succession, and a wait of minutes. Then a third, and another long wait, and then the last. Then silence. Paula began to shiver. Bell had helped her ashore from the raft and insisted on her waiting at the edge of the jungle.

"Not that you'll be any safer," he had told her grimly, "but that I may be. One person can move more quickly than two. And if I'm chased I'll plunge for the place you're hidden, and you can open fire. Then the two of us might hold them off."

"Why?" Paula said slowly.

And Bell caught at her wrist.

"Don't let me hear you talk like that!" he said sharply. "We're going to beat this thing! We've got to! And being desperate helps, but being in despair doesn't help a bit. Buck up!"

He frowned at her until she smiled.

"I will not despair again without your permission," she told him. "Really. I will not."

He found her a hiding-place and went cautiously out into the clearing, still frowning.

He had been gone five minutes before the first shot sounded, and quite ten before the last rang out dully, and was echoed and re-echoed hollowly by the jungle trees. And Paula lay waiting by the edge of the clearing, Ribiera's pearl-handled automatic in her hand—Bell had carried the rifle from the plane. Small insects moved all about her, and she heard soft rustlings as the life of the jungle went on over her head and under her feet, and terror welled up in her throat.

She was trembling almost uncontrollably when Bell came back. He walked openly toward her hiding-place.

"Paula."

She came out, trying to steady her quivering lips.

"We're all right," said Bell grimly. "This is the *fazenda* of a sub-deputy. I suspect, also, it's an emergency landing field for Ribiera on the way to that place he talked to last night. There's a two-place plane here with both wheels and floats, in a filthy little shed. It seems to be all right. We're going to take off in it and try to make Moradores, where your people are. What's the matter?"

Her face was deathly pale.

"I thought," she said with some difficulty, "when I heard the shots—I thought you were killed."

Bell shook his head.

"I wasn't," he said grimly. "It was four other men who were killed."

He led her carefully past the house. It was a fairly typical *fazenda* dwelling, if more substantial than most. It was wholly unpretentious, with whitewashed

walls, and the effect of grandeur it would give to natives of this region would come solely from the number of buildings. There were half a dozen or more.

"I killed four men," repeated Bell coldly. "And I'm damned glad of it. That scream we heard.... I know pretty well what happened here last night.

Remember, Ribiera spoke of using a beam-wireless to make his report. He must have had a short-wave beam set somewhere on the outskirts of Rio, aimed at whatever headquarters he reports to. He's going up to that headquarters some time to-day, by plane, of course. He needed emergency landing fields along the route, and here he picked out a native and made him a sub-deputy. Charming...."

Moving past the buildings, Paula caught sight of massive wooden bars set in the side of a building. Something crumpled up and limp lay before them.

"Don't look over there," said Bell harshly. "There was a woman in this house and she told me what happened, though I'd guessed it before. The sub-

deputy was here last night with a party of friends. Newly enslaved, some of them. He entertained them.... Up at Ribiera's place a girl told me she and her husband had been shown a Secret Service man. He went mad before their eyes. It was an object-lesson for them, a clear illustration of what would happen to them if they ever disobeyed. I imagine that something of the sort is used by all The Master's deputies to convince their slaves of the fate that awaits them for disobedience. The local man had brought a party up to watch two men go mad. After that sight they'll be obedient."

He reached a shed, huge, but in disrepair. Monster doors were ajar. Bell heaved at them and swung them wide. A small, trim, two-seated plane showed in the shadowy interior.

"This is for emergency use," said Bell grimly, "and we face an emergency. I'll get it out and load it up. There's a dump of gas and so on here. You might look around outside the door, in case the one man who got away can find someone to help stop me."

He set to work checking on fuel and oil. He loaded extra gas in the front cockpit, a huge tin of it. Another would crowd him badly in the pilot's cockpit in the rear, but he stowed it as carefully as he could.

"The local sub-deputy," he added evenly, "has added to the thrill by having the two men put in one cage. He let his guests observe the progress of the madness the damned poison produces. And presently, as the madness grew, the two men fought. They were murder mad.

[Image description start: A black and white illustration of two men in a cage with palm trees around them, lock together in a fight to the death.

Image description end.]

“The local sub-deputy gave his guests the thrill of watching maniacs battling to the death. He left early this morning with his party, and I imagine that everyone was suitably submissive to his demands for the future. There were four men and a woman left as

caretakers here. I found the four men before the cage, baiting the poor devil who'd killed the other last night. That's why we heard the scream. When I came up with my rifle they stared at me, and ran.

"I got one then, and as a matter of mercy I put a bullet through the man who'd gone murder mad. The"—Bell sounded as if he were acutely nauseated—"the man he'd killed was still in the cage. My God!... Then I went looking for the other three men. Wasting time, no doubt, but I found them. I was angry. I got one, and the others ran away again. A little later the third man jumped me with a knife. He slit my sleeve. I killed him. Didn't find the fourth man." Bell moved to the front of the plane. "I'll see if she catches."

He swung on the stick. It went over stiffly. Again, and again. With a bellow, the motor caught. Bell shouted in Paula's ear.

"We'll get in. Use the warming-up period to taxi out. We want to get away as soon as we can."

He helped her up into the seat, then remembered. He

rummaged about and flung a tumbled flying suit up in the cockpit with her.

"If you get a chance, put it on!" he shouted. He stepped into a similar outfit, reached up and throttled down the motor, and kicked away the blocks under the wheels. He vaulted up into place. And slowly and clumsily the trim little ship came lurching and rolling out of the shed.

The landing field was not large, but Bell took the plane to its edge. He faced it about, and bent below the cockpit combing to avoid the slip stream and look at his maps again, brought from the big amphibian. Something caught his eye. Another radio receiving set.

"Amphibian planes," he muttered, "for landing on earth or water. And radios. I wonder if he has directional for a guide? It would seem sensible, and if a plane went down the rest of them would know about where to look."

Paula reached about and touched his shoulder. She

pointed. There was a movement at the edge of the jungle and a puff of smoke. A bullet went through the fusilage of the plane, inches behind Bell. He frowned, grasped the stick, and gave the motor the gun.

It lifted heavily, like all amphibians, but it soared over the group of buildings some twenty or thirty feet above the top of the wireless mast and went on, rising steadily, to clear even the topmost trees on the farther side of the stream by a hundred feet or more.

It went on and on, roaring upward, and the jungle receded ever farther below it. The horizon drew back and back. At two thousand feet the earth began to have the appearance of a shallow platter. At three thousand it was a steep sided bowl, and Bell could look down and trace the meandering of the stream on which he had landed the night before. Not too far downstream—some fifteen miles, perhaps—were the squalid, toy sized structures of a town of the far interior of Brazil. He never learned its name, but even in his preoccupation with the management of the plane and a search for landmarks, he wondered very grimly indeed what would be the state of things in

that town. If in Rio, where civilization held sway, Ribiera exercised such despotic though secret power, in a squalid and forgotten little village like this the rule of a sub-deputy of The Master could be bestial and horrible beyond belief.

Eastward. Bell had overshot the mark the night before. Before he had located himself he was quite fifty miles beyond the spot Paula had suggested as a hiding place. Now he retraced his way. A peak jutting up from far beyond the horizon was a guiding mark. He set the plane's nose for it, and relaxed.

The motor thundered on valorously. Far below was a vast expanse of thick jungle, intercepted but nowhere broken by occasional small streams and now and then the tiny, angular things which might be houses. But houses were very infrequent. In the first ten miles—with a view of twenty miles in every direction—Bell picked out no more than four small groups of buildings which might be the unspeakably isolated *fazendas* of the folk of this region.

"Ribiera was coming this way," he muttered.

He fumbled the headphone of the radio set into place. The set seemed to be already arbitrarily tuned. He turned it on. There was a monotonous series of flashes, with the singing note of a buzzer in them. A radio direction signal.

"Ribiera's on the way."

Bell stared far ahead, without reason. And it seemed to him that just then, against that far distant guiding peak, he saw a black speck floating in mid-air.

He pulled back the joy stick. Detached, feathery clouds spread across the sky, and he was climbing for them. Paula looked behind at him, and he pointed. He saw her seem to stiffen upon sight of the other aircraft.

In minutes Bell's plane was tearing madly through sunlit fleecy monsters which looked soft and warm and alluring, and were cold and damp and blinding in their depths. Bell kept on his course. The two planes were approaching each other at a rate of nearly two hundred miles an hour.

And then, while the harsh, discordant notes of the radio signal sounded monotonously in his ears, Bell stared down and, through a rift between two clouds, saw the other plane for an instant, a thousand feet below.

The sun shone upon it fiercely. Its propeller was a shimmering, cobwebby disk before it. It seemed to hang motionless—so short was Bell's view of it—between earth and sky: a fat glistening body as of a monstrous insect. Bell could even see figures in its cockpits.

Then it was gone, but Bell felt a curious hatred of the thing. Ribiera was almost certainly in it, headed for the place to which he had spoken the night before. And Bell was no longer able to think of Ribiera with any calmness. He felt a personal, gusty hatred for the man and all he stood for.

His face was grim and savage as his own plane sped through the clouds. But just as the two aircraft had approached each other with the combined speed of both, so they separated. It seemed only a moment

later that Bell dipped down below the clouds and the other plane was visible only as a swiftly receding mote in the sunlight.

"I wonder," said Bell coldly to himself, with the thunder of the motor coming through the singing of the air route signal, "I wonder if he'll see the ship I cracked up last night?"

Paula was pointing. The shoulder of a hill upthrust beneath the jungle. The tall trees were cleared away at its crest. Small, whitewashed buildings appeared below.

"Good landing field," said Bell, his eyes narrowing suddenly. "On the direct route. Fifty miles back there's another landing field. I wonder...."

He was already suspicious before he flattened out above the house, while dogs fled madly. He noticed, too, that horses in a corral near the buildings showed no signs of fright. And horses are always afraid of landing aircraft, unless they have had much opportunity to grow accustomed to them.

The little plane rolled and bumped, and gradually came to a stop. Bell inconspicuously shifted a revolver to the outer pocket of his flying suit. Figures came toward them, with a certain hesitating reluctance that changed Bell's suspicions even while it confirmed them.

"Paula," he said grimly, "this is another landing field for Ribiera's emergency use. It sticks out all over the place. Relatives or no relatives, you want to make sure of them. You understand?"

Her eyes widened in a sudden startled fear. She caught her breath sharply. Then she said quietly, though her voice trembled:

"I understand. Of course."

She slipped out of the plane and advanced to meet the approaching figures. There were surprised, astounded exclamations: A bearded man embraced her and shouted. Women appeared and, after staring, embraced. Paula turned to wave her hand reassuringly to Bell, and vanished inside the house.

Bell looked over his instruments, examined the gas in the tank, and began to work over his maps in the blaring sunlight. He cut out the switch and the motor stopped with minor hissings of compression. The maps held his attention, though he listened keenly as he worked for any signs of trouble that Paula might encounter.

He was beginning to have a definite idea in his mind. Ribiera had talked to a headquarters somewhere, by beam radio from Rio. Beam wireless, of course, is nothing more or less than a concentration of a radio signal in a nearly straight line, instead of allowing it to spread about equally on all sides of the transmitting station. It makes both for secrecy and economy, since nearly all the power used at the sending apparatus is confined to an arc of about three degrees of a circle. Directed to a given receiving station, receiving outfits to one side or the other of that path are unable to listen in, and the signal is markedly stronger in the chosen path. Exactly the same process, of course, is used for radio directional signals, one of which still buzzed monotonously in

Bell's ears until he impatiently turned it off. A plane in the path hears the signal. If it does not hear the signal, it is demonstrably off the straight route.

Bell, then, was in a direct line from Rio to the source of a radio direction signal. Fifty miles back, where the big amphibian had crashed, he was in the same air line. To extend that line on into the interior would give the destination of Ribiera, and the location of the headquarters where direct communication with The Master was maintained.

He worked busily. His maps were in separate sheets, and it took time to check the line from Rio. When he had finished, he computed grimly.

"At a hundred miles in hour...." He was figuring the maximum distance which could plausibly be accepted as a day's journeying by air. He surveyed the maps again. "The plateau of Cuyaba, at a guess. Hm.... Fleets of aircraft could practise there and never be seen. An army could be maneuvered without being reported. Certainly the headquarters for the whole continent could be there. Striking distance of Rio,

Montevideo, Buenos Aires, La Paz, and Asunción. Five republics."

Certainly, from his figures, it seemed plausible that somewhere up on the Plateau of Cuyaba—where no rails run, no boats ply, and no telegraph line penetrates; which juts out ultimately into that unknown region where the Rio Zingu and the Tapajoz have their origins—certainly it seemed plausible that there must lie the headquarters of the whole ghastly conspiracy. There, it might be, the deadly plants from which The Master's poison was brewed were grown. There the deadly stuff was measured out and mixed with its temporary antidote....

Paula came back, a young man with her. Her eyes were wide and staring, as if she had looked upon something vastly worse than death.

"He—Ribiera," she gasped. "My uncle, he owned this place. They—have him here—alive—and mad! And all the rest...."

Bell fumbled in the pocket of his flying suit. The

young man with Paula was looking carefully at the plane. And there was a revolver in a holster at his side. An air of grim and desperate doggedness was upon him.

"This is—my cousin," gasped Paula. "He—and his wife—and—and—"

The young man took out his weapon. He fired. There was a clanging of metal, the screech of tortured steel. Bell's own revolver went off the fraction of a second too late.

"You may kill me, Senhor," said the young man through stiff lips. His revolver had dropped from limp fingers. He pressed the fingers of his left hand upon the place where blood welled out, just above his right elbow. "You may kill me. But if you and my cousin Paula escaped.... I have a wife, Senhor, and my mother, and my children. Kill me if you please. It is your right. But I have seen my father go mad." Sweat, the sweat of agony and of shame, came out upon his face. "I fought him, Senhor, to save the lives of all the rest. And I have spoiled your engine, and I have

already sent word that you and Paula are here. Not for my own life, but...."

He waited, haggard and ashamed and desperate and hopeless. But Bell was staring at the motor of the airplane.

"Crankcase punctured," he said dully. "Aluminum. The bullet went right through. We can't fly five miles. And Ribiera knows we're here—or will."

Chapter 9

There was the sound of weeping in the house, the gusty and hopeless weeping of women. Bell had been walking around and around the plane, staring at it with his hands clenched. Paula watched him.

"I am thinking," she said in an attempt at courage, "that you said I must not despair without your permission. But—"

"Hush!" said Bell impatiently. He stared at the engine. "I'd give a lot for a car. Bolts.... How many hours have

we?"

"Four," said Paula drearily. "Perhaps five. You have smashed the radio in the house?"

Bell nodded impatiently. He had smashed the radio, a marvelously compact and foolproof outfit, arbitrarily tuned to a fixed short wave-length. It was almost as simple to operate as a telephone. There had been no opposition to the destruction. Paula's cousin had disabled their plane and reported their presence. He was inside the house now, sick with shame—and yet he would do the same again. In one of the rooms of the house, behind strong bars, a man was kept who had been an object-lesson....

"Is there any machinery?" asked Bell desperately.

"Any at all about the place?"

Paula shook her head.

"It may be that there is a pump."

Bell went off savagely, hunting it. He came back and

dived into the cockpit of the plane. He came out with a wrench, and his jaws set grimly. He worked desperately at the pump. He came back with two short, thick bolts.

He crawled into the plane again, tearing out the fire wall impatiently, getting up under the motor.

"We have one chance in five thousand," he said grimly from there, "of getting away from here to crash in the jungle. Personally, I prefer that to falling into Ribiera's hands. If your cousin or anybody else comes near us, out here, call me, and I'll be much obliged."

There was the sound of scraping, patient, desperate, wholly unpromising scraping. It seemed to go on for hours.

"The wrench, please, Paula."

She passed it to him. The bullet had entered the aluminum crankcase of the motor and pierced it through. By special providence it had not struck the crankshaft, and had partly penetrated the crankcase

on the other side. Bell had cut it out, first of all. He had two holes in the crankcase, then, through which the cylinder oil had drained away. And of all pieces of machinery upon earth, an aircraft motor requires oil.

Bell's scraping had been to change the punctured holes of the bullet into cone shaped bores. The aluminum alloy was harder than pure aluminum, of course, but he had managed it with a knife. Now he fitted the short bolts in the bores, forced the threads on them to cut their own grooves, and by main strength screwed them in to a fit. He tightened them.

He came out with his eyes glowing oddly.

"The vibration will work them loose, sooner or later," he observed grimly, "and they may not be oil tight. Also, the crankshaft may clear them, and it may not. If we go up in the ship in this state we may get five miles away, or five hundred. At any minute it may fail us, and sooner or later it will fail us. Are you game to go up, Paula?"

She smiled at him.

"With you, of course."

He began to brush off his hands.

"There ought to be oil and gas here," he said briefly.

"Another thing, there'll probably be some metal chips in the crankcase, which may stop an oil line at any minute. It's a form of committing suicide, I imagine."

He went off, hunting savagely for the supplies of fuel and lubricant which would be stored at any emergency field. He found them. He was pouring gasoline into the tanks before what he was doing was noticed. Then there was stunned amazement in the house. When he had the crankcase full of oil the young man came out. Bell tapped his revolver suggestively.

"With no man about this house," he said grimly,

"Ribiera will put in one of his own choice. And you have a wife and children and they'll be at that man's mercy. Don't make me kill you. Ribiera may not blame you for my escape if you tell him everything—and you're hurt, anyway. Either we get away, and you do

that, or you're killed and we get away anyhow."

He toppled two last five gallon tins of gasoline into the cockpits—crowding them abominably—and swung on the prop. The engine caught. Bell throttled it down, kicked away the stones with which he had blocked its wheels, and climbed up into the pilot's cockpit. With his revolver ready in his lap he taxied slowly over to a favorable starting point.

The ship rose slowly, and headed west again. At three thousand feet he cut out the motor to shout to Paula.

"One place is as good as another to us, now. The whole continent is closed to us by now. I'm going to try to find that headquarters and do some damage. Afterwards, we'll see."

He cut in the motor again and flew steadily westward. He rose gradually to four thousand feet, to five.... He watched his instruments grimly, the motor temperature especially. There were flakes of metal in the oil lines. Twice he saw the motor temperature rise to a point that brought the sweat out on his face. And

twice he saw it drop again. Bits of shattered metal were in the oiling system, and they had partly blocked the stream of lubricant until the engine heated badly. And each time the vibration had shifted them, or loosened them....

They had left the big amphibian no earlier than nine o'clock. It was noon when they took off for the *fazenda* of Paula's kin. But it was five o'clock and after when they rose from there with an engine which might run indefinitely and might stop at any second.

Bell did not really expect it to run for a long time. He had worked as much to cheat Ribiera of the satisfaction of a victory as in hopes of a real escape. But an hour, and the motor still ran. It was consistently hotter than an aero engine should run. Twice it had gone up to a dangerous temperature. One other time it had gone up for a minute or more as if the oiling system had failed altogether. But it still ran, and the sun was sinking toward the horizon and shadows were lengthening, and Bell began to look almost hopefully for a clearing in which to land before the dark hours came.

Then it was that he saw the planes that had been sent for him and for Paula.

There were three of them, fast two-seaters very much like the one he drove. They were droning eastward, with all cockpits filled, from that enigmatic point in the west. And Bell had descended to investigate a barely possible stream when they saw him.

The leader banked steeply and climbed upward toward him. The others gazed, swung sharply, and came after him, spreading out as they came. And Bell, after one instant's grim debate, went into a maple leaf dive for the jungle below him. The others dived madly in his wake. He heard a sharp, tearing rattle. A machine-gun. He saw the streaks of tracers going very wide. Gunfire in the air is far from accurate. A machine-gun burst from a hundred yards, when the gun has to be aimed by turning the whole madly vibrating ship, is less accurate than a rifle at six hundred, or even eight. Most aircraft duels are settled at distances of less than a hundred yards.

It was that fact that Bell counted on. With a motor

that might go dead at any instant and a load of passengers and gas at least equaling that of any of the other ships, mere flight promised little. The other ships, too, were armed, at any rate the leader was, and Bell had only small arms at his disposal. But a plane pilot, stunting madly to dodge tracer bullets, has little time to spare for revolver work.

Bell had but one advantage. He expected to be killed. He looked upon both Paula and himself as very probably dead already. And he infinitely preferred the clean death of a crash to either the life or death that Ribiera would offer them. He flattened out barely twenty yards above the waving branches that are the roof of the jungle. He went scudding over the tree tops, rising where the jungle rose, dipping where it dropped, and behind him the foliage waved wildly as if in a cyclone.

The other planes dared not follow. To dive upon him meant too much chance of a dash into the entrapping branches. One plane, indeed, did try it, and Bell scudded lower and lower until the wheels of the small plane were spinning from occasional, breath taking

contacts with the feathery topmost branches of jungle giants. That other plane flattened out not less than a hundred feet farther up and three hundred yards behind. To fire on him with a fixed gun meant a dive to bring the gun muzzle down. And a dive meant a crash.

A stream flashed past below. There was the glitter of water, reflecting the graying sky. A downward current here dragged at the wings of the plane. Bell jerked at the stick and her nose came up. There was a clashing, despite her climbing angle, of branches upon the running gear, but she broke through and shot upward, trying to stall. Bell flung her down again into his mad careering.

It was not exactly safe, of course. It was practically a form of suicide. But Bell had not death, but life to fear. He could afford to be far more reckless than any man who desired to live. The plane went scuttling madly across the jungle tops, now rising to skim the top of a monster *ceiba*, now dipping deliberately.

The three pursuing planes hung on above him

helplessly while the short, short twilight of the tropics fell, and Bell went racing across the jungle, never twenty feet above the tree top and with the boughs behind him showing all the agitation of a miniature hurricane. As darkness deepened, the race became more suicidal still, and there were no lighted fields nearby to mark a landing place. But as darkness grew more intense, Bell could dare to rise to fifty, then a hundred feet above the tops, and the dangers of diving to his level remained undiminished. And then it was dark.

Bell climbed to two hundred feet. To two hundred and fifty. With more freedom, now, he could take one hand from the controls. He could feel the menace of the tumultuously roaring motors in his wake, but he was smiling very strangely in the blackness. He reached inside his flying suit and tore away the front of his shirt. He reached down and battered in the top of one of the five gallon gasoline tins in the cockpit with the barrel of his revolver. He stuffed the scrap of cloth into the rent. It was wetted instantly by the splashing. Another savage blow, unheard in the thunder of the

motor. In the peculiarly calm air of the cockpit the reek of gasoline was strong, but cleared away. And Bell, with the frosty grim smile of a man who gambles with his life, struck a light. The cloth flared wildly, and he reached his hands into the flame and heaved the tin of fuel overside.

The cloth was burning fiercely, and spilled gasoline caught in mid-air. A fierce and savage flame dropped earthward. Spark on the cloth, and the cloud of inflammable vapor that formed where the leaking tin fell plummetlike, carried the flame down when the wind of its fall would have blown it out.

The following planes saw a flash of light. They saw a swiftly descending conflagration tracing a steep arch toward the tree tops. They saw that flaming vanish among the trees. And then they saw a vast upflaring of fire below. Flames licked upward almost to the tree tops....

Bell looked back from two thousand feet. Wing-tip lights were on, below, and disks of illumination played upon the roof of the jungle above the fire. The three

planes were hovering over the spot. But a thick dense column of smoke was rising, now. Green things shriveling in the heat, and dried and rotted underbrush. Altogether, the volume of smoke and flame was very convincing evidence that an airplane had burst into flame in mid-air and crashed through the jungle top to burn to ashes beneath.

But Bell climbed steadily to five thousand feet. He cut out the motor, there, and in the shrieking and whistling of wind as the plane went into a shallow glide, he spoke sharply.

"Paula?"

"I am all right," she assured him unsteadily. "What now?"

"There's a seat pack under you," said Bell. "It's a parachute. You'd better put it on. God only knows where we'll land, but if the motor stops we'll jump together. And I think we'll have to jump before dawn. This plane won't fly indefinitely. There's just one chance in a million that I know of. There'll be a moon

before long. When it comes up, look for the glitter of moonlight on water. With the wing-tip lights we may—we may—manage to get down. But I doubt it."

He moved his hand to cut in the motor again. She stopped him.

"If we head south," she said unsteadily, "we may reach the Paraguay. It is perhaps two hundred miles, but it is broad. We should see it. Perhaps even the stars...."

"Good work!" said Bell approvingly. "*Nils desperandum!* That's our motto, Paula."

He swung off his course and headed south. He was flying high, now, and an illogical and incomprehensible hope came to him. There was no hope, of course. He had had, more than once, a despairing conviction that the utmost result of all his efforts would be but the delaying of their final enslavement to The Master, whose apparent impersonality made him the more terrible as he remained mysterious. So far they seemed like

struggling flies in some colossal web, freeing themselves from one snaring spot to blunder helplessly into another.

But the moon came up presently, rounded and nearly full. The sky took on a new radiance, and the jungle below them was made darker and more horrible by the contrast.

And when there were broad stretches of moonlit foliage visible on the rising slopes beneath, Bell felt the engine faltering. He switched on the instrument board light. One glance, and he was cold all over. The motor was hot. Hotter than it had ever been. The oil lines, perhaps the pump itself....

Paula's hand reached back into the glow of the instrument board. He leaned over and saw her pointing. Moonlight on rolling water, far below. He dived for it, steeply. The wing-lights went on. Faint disks of light appeared far below, sweeping to and fro with the swaying of the plane, bobbing back and forth.

It seemed to Bell that there had been nothing quite as horrible as the next minute or two. He felt the overheated, maltreated motor laboring. It was being ruined, of course—and a ruined motor meant that they were marooned in the jungle. But if it kept going only until they landed. And if it did not....

White water showed below in the disks of the landing lights' glow. It tumbled down a swift and deadly *raudal*—a rapid. And then—black, deep water, moving swiftly between tall cliffs of trees.

Bell risked everything to bank about and land toward the white water. The little plane seemed to be sinking into a canyon as the trees rose overhead on either side. But the moonlit rapid gave him his height, approximately, and the lights helped more than a little.

He landed with a terrific crash. The plane teetered on the very verge of a dive beneath the surface. Bell jerked back the stick and killed the engine, and it settled back.

A vast, a colossal silence succeeded the deafening noise of twelve cylinders exploding continuously. There were little hissing sounds as the motor cooled. There was the smell of burnt oil.

"All right, Paula?" asked Bell quietly.

"I—I'm all right."

The plane was drifting backward, now. It spun around in a stately fashion, its tail caught in underbrush, and it swung back. It drifted past cliffs of darkness for a long time, and grounded, presently, with a surprising gentleness.

"Do you know," said Bell dryly, "this sort of thing is getting monotonous. I think our motor's ruined. I never knew before that misfortunes could grow literally tedious. I've been expecting to be killed any minute since we started off, but the idea of being stuck in the jungle with a perfectly good plane and a bad motor...."

He fished inside his flying suit and extracted a

cigarette. Then he lit it.

"Let's see.... We haven't a thing to eat, have we?"

There was a little slapping noise. Bell became suddenly aware of a horde of insects swarming around him. Smoke served partially to drive them off.

"Look here," he said suddenly, "we could unfold a parachute and cover the cockpits for some protection against these infernal things that are biting me."

"We may need the parachute," said Paula unsteadily.

"Does—does that smoke of yours drive them away?"

"A little." Bell hesitated. "I say, it would be crowded, but if I came up there, or you here...."

"I—I'll come back there," she said queerly. "The extra cans of gasoline here...."

She slipped over the partition, in the odd flying suit which looks so much more odd when a girl wears it. She settled down beside him, and he tried

painstakingly to envelope her in a cloud of tobacco smoke. The plague of insects lessened.

There was nothing to do but wait for dawn. She was very quiet, but as the moon rose higher he saw that her eyes were open. The night noises of the jungle all about them came to their ears. Furtive little slitherings, and the sound of things drinking greedily at the water's edge, and once or twice peculiar little despairing small animal cries off in the darkness.

The jungle was dark and sinister, and all the more so when the moon rose high and lightened its face and left them looking into weird, abysmal blackness between moonlit branches. Bell thought busily, trying not to become too conscious of the small warm body beside him.

He moved, suddenly, and found her fingers closed tightly on the sleeve of his flying suit.

"Frightened, Paula?" he asked quietly. "Don't be. We'll make out."

She shook her head and looked up at him, drawing away as if to scan his face more closely.

"I am thinking," she said almost harshly, "of biology. I wonder—"

Bell waited. He felt an intolerable strain in her tensed figure. He put his hand comfortingly over hers. And, astoundingly, he found it trembling.

"Are all women fools?" she demanded in a desperate cynicism. "Are we all imbeciles? Are—"

Bell's pulse pounded suddenly. He smiled.

"Not unless men are imbeciles too," he said dryly.

"We've been through a lot in the past two days. It's natural that we should like each other. We've worked together rather well. I—well"—his smile was distinctly a wry and uncomfortable one—"I've been the more anxious to get to some civilized place where The Master hasn't a deputy because—well—it wouldn't be fair to talk about loving you while—" he shrugged, and said curtly, "while you had no choice but to

listen."

She stared at him, there in the moonlight with the jungle moving about its business of life and death about them. And very, very slowly the tenseness left her figure. And very, very slowly she smiled.

"Perhaps," she said quietly, "you are lying to me, Charles. Perhaps. But it is a very honorable thing for you to say. I am not ashamed, now, of feeling that I wish to be always near you."

"Hush!" said Bell. He put his arm about her shoulder and drew her closer to him. He tilted her face upward. It was oval and quite irresistibly pretty. "I love you," said Bell steadily. "I've been fighting it since God knows when, and I'm going to keep on fighting it—and it's no use. I'm going to keep on loving you until I die."

Her fingers closed tightly upon his. Bell kissed her.

"Now," he said gruffly, "go to sleep."

He pressed her head upon his shoulder and kept it there. After a long time she slept. He stirred, much later, and she opened her eyes again.

"What is it?"

"Damn these mosquitos," growled Bell. "I can't keep them off your face!"

Chapter 10

For four hours after sunrise Bell worked desperately. With the few and inadequate tools in the plane he took apart the oiling system of the motor. It was in duplicate, of course, like all modern air engines, and there were three magnetos, and double spark plugs. Bell drained the crankcase beneath a sun that grew more and more hot and blistering, catching the oil in a gasoline can that he was able to empty into the main tanks. He washed out innumerable small oil pipes with gasoline, and flushed out the crankcase itself, and had at the end of his working as many small scraps of metal as would half fill a thimble. He showed then to Paula.

"And the stars in their courses fought against Sisera," he quoted dryly. "Any one of these, caught in just the right place, would have let us down into the jungle last night."

She smiled up at him.

"But they didn't."

"No.... God loves the Irish," said Bell. "What's that thing?"

Paula was fishing, sitting on a fallen tree in the cloud of smoke from a smudge fire Bell had built for her. She was wearing the oily flying suit he had found in the shed with the plane, and had torn strips from her discarded dress to make a fishing line. The hook was made out of the stiff wire handle of one of the extra gasoline tins. "Hook and leader in one," Bell had observed when he made it.

He was pointing to a flat bodied fish with incredible jaws that lay on the grass, emitting strange sounds even in the air. It flapped about madly. Its jaws closed

upon a stick nearly half an inch thick, and cut it through.

"It is a *piranha*," said Paula. "The same fish that bit your hand. It can bite through a copper wire fastened to a hook, but this hook is so long...."

"Pleasant," said Bell. Something large and red passed before his eyes. He struck at it instinctively.

"Don't!" said Paula sharply.

"Why?"

"It's a *maribundi* wasp," she told him "And its sting.... Children have died of it. A strong man will be ill for days from one single sting."

"Still more pleasant," said Bell. "The jungle is a charming place, isn't it?" He wiped the sweat off his face. "Any more little pets about?"

She looked about seriously.

"There." She pointed to a sapling not far distant. "The *palo santo* yonder has a hollow trunk, and in it there are usually ants, which are called fire-ants. They bite horribly. It feels like a drop of molten metal on your flesh. And it festers afterwards. And there is a fly, the *berni* fly, which lays its eggs in living flesh. The maggot eats its way within. I do not know much about the jungle, but my father has—had a *fazenda* in Matto Grosso and I was there as a child. The *camaradas* told me much about the jungle, then."

Bell winced, and sat down beside her. She had Ribiera's pearl handled automatic within easy reach. She saw him looking at it.

"I do not think there is any danger," she said with a not very convincing smile, "but there are *cururus*—water snakes. They grow very large."

"And I asked you to fish!" said Bell. "Stop it!"

She hauled the line ashore, with a flapping thing on the end of it. Bell took the fish off and regarded her catch moodily.

"I'd been thinking," he said moodily, "that Ribiera suspects we're dead. I'd been envisioning ourselves as marooned, yes, but relatively safe as long as we were thought to be dead. And I'd thought that if we lived a sort of castaway existence for a few weeks we'd be forgotten, and would have a faint chance of getting out to civilization without being noticed. But this...."

"I will stay," she said steadily. "I will stay anywhere or go anywhere, with you."

Bell's hand closed on her shoulder.

"I believe it," he said heavily. "And—if you noticed—I had been thinking of letting down the Trade. I'd been thinking of not trying to fight The Master any longer, but only of getting you to safety. In a sense, I was thinking of treason to my job and my government. I suspect"—he smiled rather queerly—"I suspect we love each other rather much, Paula. I'd never have dreamed for anyone else. Go over to the plane and don't fish any more. I'll rustle the food for both of us."

She stood up obediently, smiling at him.

"But kill that *piranha* before you try to handle it," she advised seriously.

Bell battered the savage thing until it ceased to move. He picked it up, then, and sniffed the air. Paula had been in a cloud of acrid smoke. She could not have detected the taint in the air he discovered. He went curiously, saw a broken branch overhead, and then saw something on the ground.

He came back to the plane presently, looking rather sick.

"Give me one of the machetes, Paula," he said quietly.
"We brought them, I think."

"What is the matter?"

He took the wide-bladed woods knife.

"A man," he said, nauseated. "He either fell or was thrown from somewhere high above. From a plane. He was United States Secret Service. There's a badge in his clothes. Don't come."

He went heavily over to the spot beyond the smudge fire. He worked there for half an hour. When he came back there were earth stains on his hands and clothing, and he carried a very small brown package in his hand.

"He had a report ready to send off," said Bell grimly. "I read it. It's in code, of course, but in the Trade...."

He set to work savagely on the engine, reassembling it. As he worked, he talked in savage, jerky sentences.

"The Service man at Asunción. One of the seven who vanished. He'd learned more than we have. He was caught—poisoned, of course—and pretended to surrender. Told a great deal that he shouldn't, in order to convince The Master's deputy. The key men in nearly every republic in South America are in The Master's power. Paraguay belongs to him, body and soul. Bolivia is absolutely his. Every man of the official class from the President down knows that he has two weeks or less of sanity if The Master's deputy shuts down on him—and he knows that at the crook of the deputy's finger he'll be assassinated before then. If

they run away, they go murder mad. If they stay, they have to obey him. It's hellish!"

He stopped talking to make a fine adjustment. He went on, somberly.

"Chile's not so bad off, but the deputy has slaves nearly everywhere. Ecuador—well, the President and half of Congress have been poisoned. The man I found was trying to get a sample of the poison for analysis. He'd learned it was unstable. Wouldn't keep. The Master has to send fresh supplies constantly all over the continent. That accounts for the deputies remaining loyal. If The Master had reason to suspect them, he had only to stop their supply.... They couldn't stock up on the deadly stuff for their own use. So they're as abjectly subject to The Master as their slaves are to them. No new slaves are to be made in Paraguay or Bolivia, except when necessary. It's believed that in six months the other republics will have every influential man subjected. Every army officer, every judge, every politician, every outstanding rich man.... And then, overnight, South America will become an empire, with that devil of a

Master as its overlord."

He lifted one of the oil pumps in place and painstakingly tightened the bolts that held it.

"Picture it," he said grimly. "Beasts as viceroys, already taking their pleasure. Caligulas, Neros, on viceregal thrones all over the continent.... And every man who shows promise, or shows signs of honor or courage or decency, either killed or sent mad or...."

Paula was watching his face closely.

"I think," she said soberly, "that there is something worse."

Bell was silent for an instant.

"For me," he said bitterly, "it is. Before The Master dares to make his coup public, he must be sure that there will be no foreign interference. So, he must establish a deputy in Washington. A relatively few chosen men, completely enslaved, could hold back our Government from any action. Leaders in

Congress, and members of the Cabinet, working, in defense of The Master because his defeat would mean their madness.... He would demand no treason of them at first. He would require simply that he should not be interfered with. But his plans include the appointment of deputies in the United States later on. I don't think he can subdue America. I don't think so. But he could—and I think he would—send whole cities mad. And if you think of that...."

He was silent, working. A long, long time later he swung on the propeller. The motor caught. He throttled it down and watched it grimly. The motor warmed up to normal, and stayed there.
